The ice cream men of twenty states are making hotel reservations now (The Piedmont, Ansley, Winecoff and Georgia Terrace)

An exhibition saving an ice cream manufacturer months of time, hundreds of dollars, scores of opportunities otherwise lost—revealing to him methods and means evolved throughout the entire country

THE South, land of sun and illimitable future, this year comes into its own in ice cream.

A SOUTHERN EXHIBITION arraying everything in machinery, services, equipment and supplies used by ice cream manufacturers will be held in Atlanta, November 28th to December 2nd inclusive.

The Southern, North Carolina and Tri-State Associations of Ice Cream Manufacturers will hold their annual conventions in conjunction with it. All ice cream manufacturers are welcomed guests to the South's greatest building for displays—to Dixie's greatest Ice Cream exposition.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
1328 BROADWAY NEW YORK CITY

The Stockton Show

By L. Diamond, Manager Pacific Slope Dairy Products Show.

The dairy industry of California and the Pacific Coast has very rapidly grown and developed in recent years, but on account of lack of organization and the complex nature of the business, no one, not even of those actively interested, has actually realized its present size and importance, its bearing upon our other industries, and its essential importance to the physical and economic welfare of our people. The business of transforming cow's milk into the several kinds of dairy products that are demanded by the public has rapidly brought into existence numerous manufacturing activities which, in turn, have been the cause of the creation of a great line of manufacturers of machinery, equipment and supplies. At first, the men engaged in these activities scarcely realized that they properly were a part of the dairy industry. The words 'dairy industry' to them meant only the dairy farmers and breeders of dairy cattle. Manufacturers of special products, such as ice cream, condensed milk, and others, regarded themselves as separate and distinct, and, until quite recently, could not see that they were factors in the industry.

All this is changed to-day, largely through the efforts of the National Dairy Association which has, from its beginning, fostered the National Dairy Show. That great institution is now recognized by the United States and all state governments, by scientists and educators, and by the commercial world, as being the pulsator of one of the nation's greatest industries. Its annual shows are now the center of attraction and the recognized meeting place for every kind of organization which deals in any way, no matter how remote, with the numerous problems of the dairy industry. The Pacific Coast occupies a peculiar situation with respect to this national gathering. The National Show must necessarily be held somewhere in the Mississippi Valley or the Eastern states. We are separated by a distance of 2,000 miles, a great range of mountains, and a wide desert. The expense of sending cattle is almost prohibitive, and the cost of traveling prevents a considerable number of our people from making the journey.

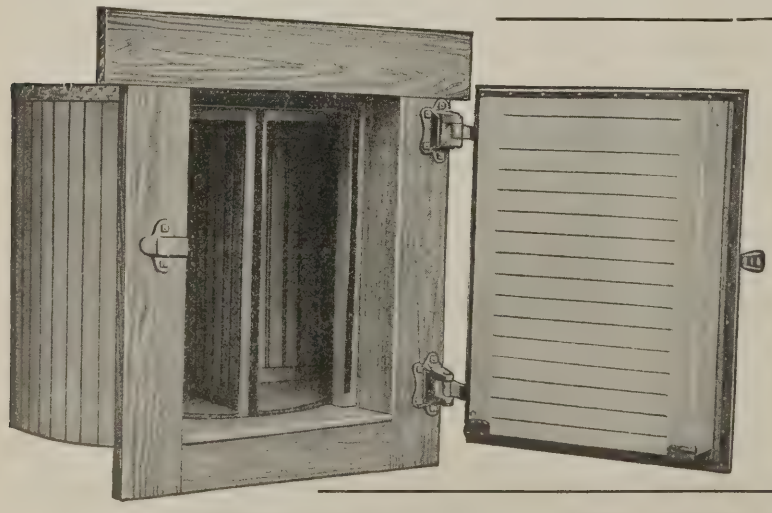
There are more than a million head of dairy cows in the Pacific Slope states, and the value of the manufactured products is in excess of 150 million dollars annually. California alone produces over 70 million pounds of butter per year, and consumes about 15 million gallons of ice cream annually.

Moreover, an infant dairy industry is developing in the Hawaiian Islands, in Mexico, and on the west coast of South America.

It is hard to visualize all this, and impossible to do so unless a general annual gathering can be had here on the Pacific Coast. The Pacific Slope Dairy Products Show that will be given in Stockton, December 5th to 11th next, is the first effort to bring together the organizations that exist here but which heretofore have held their convention separately and apart from each other, and to assemble a comprehensive exhibit of the various and numerous dairy products manufactured in the states west of the Rocky Mauntains. The purposes of the Show are:

1. A display of progress in dairying.
2. To further a spirit of co-operation for the promotion of all interests that are dependent upon the dairy cow.
3. To show to ourselves and the public something of the scope and importance of the industry and its numerous activities.

Those who will participate are:



1. Manufacturing organizations.
2. Milk distributors.
3. Exhibitors of dairy products machinery, equipment and supplies.
4. University of California.
5. State Department of Agriculture.
6. United States Department of Agriculture.
7. California Dairy Council.

To the directors of California Dairy Council should be given all the credit for the conception of the idea and the effort of its realization. That organization has, in a remarkably short time, arisen to a position of strong influence in the industry. Its rapid growth and valuable service are explained by the fact that it is a harmonizing organization, is exclusively educational in character, and deals only with fundamental questions affecting the industry. Under the guidance of the far-seeing men who direct its activities the Dairy Products Show should be a brilliant success.

There will be scoring contests in butter, cheese, ice cream and market milk and cream. Attractive official medals and ribbons will be awarded by the Show itself, and many handsome cups and cash prizes will be donated to medal winners.

The Show will be held in the California State Armory, which is conveniently located and well adapted to the needs of such an affair.

The success of this Show depends upon the co-operation of all dairy interests in the Pacific Slope States. No private or personal gain should be expected. This,

the first effort of its kind west of Chicago, must be the foundation upon which to build greater Shows throughout the succeeding years.

Members of all branches of the dairy industry, your duty is clear — Exhibit in the Stockton Show! Boost for it, and go to Stockton and participate in its many activities! Remember there are to be five big conventions during the week. You are surely interested in some of them.

The dates — December 5 to 11, inclusive.

The place — California State Armory, Stockton.

⚜

A LIVE BUNCH.

What do you do when a delegation of good fellows break into your office without advance notice, put their feet on your desk and proceed to make themselves at home? You make them believe you like it, don't you?

That is just what happened a few days after the close of the National Dairy Show when "Henry W.", with A. Daigger & Co., Chicago, Dr. W. L. Wright, of the Sealright Co., Fulton, N. Y., and R. J. Decy, with Emery Thompson Machine and Supply Company of New York City took possession of the Review office for a half hour's visit. They were on their way to Chicago by motor from the National Dairy Show. They visited several Northern Wisconsin towns, combining business with pleasure. "Henry W." as chaffeur, looked rather solemn and we suspect that the rest of the crowd had been driving from the rear seat, and making remarks about his car, his eye sight, etc. At least Decy and Wright were jubilant and were having the time of their young lives. They are still wondering where Detour, Wisconsin, is located. They report that they saw several sign boards labelled "Detour", but each time they followed directions they got off the main road and finally gave up looking for the place. They quite fell in love with Northern Wisconsin.

We enjoyed their visit very much and we hope to have them "repeat".

⚜

REVENUE OFFICERS FIGURES.

Minneapolis, Minn.—Business in ice cream has been more brisk than in nearly any other commodity in this section for some time. The collector of internal revenue for Minnesota stated Oct. 19th that people of the state spent over half a million dollars for ice cream in September, the government taxes aggregating $53,457.28.

"He let us copy his 'rithmetic an' it was all wrong."

THE INTRODUCTION OF GELATINE TO THE ICE CREAM INDUSTRY.

The use of gelatine in the making of ice cream is quite commonly practiced now by ice cream manufacturers. Very little has been said, however, as to how this practice was introduced in the ice cream manufacturing industry. We are in receipt of information given us by the Thomas W. Dunn Company concerning the late Mr. Dunn's personal experiences at the time gelatine was looked upon as an article unfit for human consumption. Mr. Dunn many times narrated to friends how he had to wait until all customers were out of the ice cream establishment before he dared to approach the prospective customer with such a "low-life" and "lawless" article as gelatine.

THOMAS W. DUNN

The first buyers of gelatine did not dare receive it under its real name but such names as "paste," or "glue" would be used, for many times neither the employees of the ice cream manufacturer or the freight handlers knew that gelatine was being shipped in and used in the manufacture of ice cream. Mr. Dunn when visiting these manufacturers carried small quantities of gelatine in bags in his pockets and a 5 pound bag in a hand bag as he did not deem it wise to make it known to the public he was endeavoring to make sales of this "stuff" to prominent concerns.

Mr. Dunn first conceived of the idea of using gelatine in ice cream through his successive dealings with buttermakers who in those days were permitted to manufacture oleomargarine butter. As this industry died out and buttermakers catered somewhat to making ice cream on the side, this suggested the idea of using gelatine for stabilizing ice cream.

Up until 1900, the Thomas W. Dunn Company was practically the only company in the whole United States who specialized in ice cream gelatine.

Today gelatine or gum is used by all the successful ice cream manufacturers. The average amount of gelatine running from 1 to 4 ounces to the 100 pound mix.

USEFUL INFORMATION

for manufacturers of
ice cream and water ices
who want to make their products BETTER

GUMPERT'S ICE CREAM IMPROVER

Ice Cream ripened by the usual methods alone cannot reach the same degree of excellence as ice cream in which Gumpert's Improver has been used. This product is as beneficial in aged mixes as in fresh mixes.

Gumpert's Improver is not a *substitute* for natural ripening but a *supplement* to it.

Like Nature, Gumpert's Improver softens and breaks down the coating of albumen, casein, ash and other milk solids that surround the globules of butter fat in cream; but does it far more quickly and more thoroughly than natural aging alone.

The higher proportion of butter fat thus released gives the ice cream a richer, finer taste.

The complete softening of the milk solids by Gumpert's Improver permits the air, when whipped in, to form small, numerous and regular shaped cells. An even, soft, velvety texture is produced in the ice cream.

TEXTOR

A STABILIZER FOR WATER ICES AND SHERBETS

Textor eliminates the roughness and the uneven grain found in ordinary water ices and sherbets.

It produces a wonderfully smooth, even, luscious texture, delightfully free from lumpiness and crystalization.

Textor-stabilized ices and sherbets, no matter how often repacked, harden smoothly and uniformly. The sugar, water, fruit and flavor are held in perfect suspension from the first dipper full till the last scraping at the bottom of the can.

Textor, when dissolved, is colorless, odorless, tasteless. Simply mix it with the sugar dry, add the water, then the fruit, and freeze.

The consumption of water ices and sherbets is far smaller than it would be if the ices were better made. Textor brings about much of the improvement which is so essential to the development of this profitable business.

Note, Particularly

Refrigerated Delivery

Address of J. H. SCHINDLER, of Telling Belle Vernon Company, Cleveland, before the National Association of Ice Cream Manufacturers

The production of refrigeration by artificial means is centuries old. It is only in the last few years, however, that cold storage methods have been extensively applied.

J. H. SCHINDLER

History shows that ice was used for domestic purposes as early as the time of Nero. It is also thought that they used salt and ice for freezing just as it is being done today. We think we have made wonderful advancement in the process of cooling, but really it's old, yet very efficient if properly applied, and easily and economically produced.

The principle of refrigeration for delivery bodies has been solved. I believe however, that some improvement can still be made that would make for maximum efficiency.

First, it is a great saving of time on account of the accessibility to the driver's load.

Second, cans do not get wet from melted ice and do not show the uncleanliness which is often the case by the cans covered with ice and salt.

Third, ice for packing purposes is of much greater value and shrinkage reduced to a minimum by refrigerated delivery method.

One of the most important factors in refrigerated delivery is the proper insulation of the storage compartment. The very best materials should be used in their construction, as you gentlemen all have had more or less experience with faulty insulation. Special attention should be given the construction of doors and hinges to insure airtight compartments and at the same time provide for the hard usage to which they are subjected.

I trust and believe the manufacturers of refrigerated delivery bodies will strive to improve in their construction. One item I wish to mention, and that is the elimination of weight as much as possible. The weight of loaded vehicles is quite a serious problem in some states and cities where laws and ordinances have been enacted governing maximum loads permissable on highways.

We have had about a year's experience with refrigerated delivery on auto trucks, and without an exception it has been very satisfactory. Our drivers claim that the work is much easier and enables them to serve at least fifteen to twenty per cent more customers in the same period of time than it does by the old method of packing in salt and ice. During the month of July this season the drivers who were operating refrigerated units returned no soft cream. Our experience in suburban delivery proved just as satisfactory.

We intend to refrigerate all our horse drawn ice cream wagons as quickly as possible. In addition we have refrigerated delivery bodies on semi-trailers transporting bottle milk from the main plant to our suburban stations with excellent results. I believe it unnecessary to comment any further as to their practicability, economy, or otherwise.

In conclusion I desire to say that we are strong for refrigerated delivery. While we will have no data on costs until the end of the year, comparison at intervals versus the old method reveals a great saving in ice, salt and time which you all realize is a big factor in the cost of delivery.

ICE CREAM PLANT ADDING NEW IMPROVEMENTS.

Resumption of work on the building as was originally planned by the Ortonville Ice Cream and Butter Company, Ortonville, Minn., was commenced by contractors.

When completed the building will be 40x100 feet and will be strictly fire-proof. It will have full basement of concrete and tile. The upper part will be constructed of brick.

Present operations will be limited to the completion of the basement which was begun last year, Fred Pflueger, president of the company, said, with the hope that the rest of the work may be undertaken in the course of a few months.

Extensive operations of the company in that part of the state and along the Milwaukee Line west into South Dakota has resulted in an increased demand for ice cream manufactured by the company which necessitates more floor space.

NEW YORK PHILADELPHIA CHICAGO ST. LOUIS SAN FRANCISCO

MEMBER THE ASSOCIATION OF ICE CREAM SUPPLY MEN

GO TO THE NATIONAL DAIRY SHOW.

No, this is not an article left over from the pre-show period. The National Dairy Show referred to in the following is held in London, England:

A storehouse of information
About the dairy cow,
The best of machinery
And methods up to now;
A place to get ideas,
To learn the latest way,
To meet others in your business,
To study the great display;
The place to gain knowledge
Of the things you ought to know,
From the cow to finished product
At the London Dairy Show.

See the finest dairy cattle
Representing every breed
The kind that make the profit
And the kind that you will need;
Learn of vitamines in milk,
That build muscle and bone,
Necessary to human growth
Though chemically unknown.
See results of health studies;
And then you will begin
To have a better, prouder notion
Of the business you are in.

Talk to men of experience,
The experts in their lines,
Who have studied out the problems
Whose minds are richest mines.
They'll tell facts that they have proven,
Show you the proper way.
Point out the leaks and tell you
How to make your business pay
They'll all be there to aid you,
So surely you will go
To Islington in October
And the London Dairy Show.

—The Dairy.

KIRK-MAHER RE-ORGANIZATION.

Clarence E. Kilburn Succeeds F. Roy Kirk.

At a meeting of the Kirk-Maher interests, held at the company's head offices in Malone, N. Y., recently Clarence E. Kilburn, heretofore vice-president of the company, was named as president to succeed the late F. Roy Kirk, whose death occurred in St. Paul on October 15th.

Mr. Kilburn has been with the Kirk-Maher organization since the close of the European war, in which he served as a captain of infantry. Returning to this country he entered the employ of the Kirk-Maher Company as sales manager and has worked himself through the successive executive position to the chair of president, in which position he will have active supervision over the four plants bearing the Kirk-Maher name at Massena, Malone, Plattsburg and Watertown, and the four affiliated companies controlled and operated by the Kirk-Maher interests at Montreal, Utica, Oneonta and Binghamton. All of these plants are engaged exclusively in the manufacture of Purity ice cream.

Mr. Kilburn is a Cornell graduate, and during the time he has been associated with the Kirk-Maher organization has taken a place among the prominent young men in the ice cream industry. His elevation to head the above organization has met with the full satisfaction of the stockholders and public generally. Mr. Kilburn is a director of the People's Trust Company, of Malone, and vice-president of the Malone Chamber of Commerce.

E. B. Lewis is Vice-President.

Associated with Mr. Kilburn under the re-organization is a man whose name in the ice cream industry is known from coast to coast, in the person of E. B. Lewis, president of the Horton Ice Cream Company, of New York City. Mr. Lewis has long been a stockholder in the Kirk-Maher Company, and has for many years been a warm personal friend of its late president. Mr. Lewis' election to the post of vice-president cements an important business affiliation which adds strength to the entire Purity chain in its future development.

Mrs. Elizabeth Kirk, widow of the late president, was named as a director of the company and as chairman of the board. Associated on the board of directors besides Mrs. Kirk and Mr. Kilburn, is N. Monroe Marshall, treasurer of the State of New York, president of the People's Trust Company, of Malone, and widely known in the political, financial and business life of northern New York. Other officers are George H. Frechette, secretary and treasurer, and E. M. Berry, assistant treasurer.

The policies inaugurated by the late F. Roy Kirk, who founded the Purity Ice Cream enterpises, will be continued and carried out by the new organization.

⚜

WILL PUT UP NEW CREAMERY AND ICE CREAM BUILDING

The Laurens Co-operative Creamery Company, Laurens, Ia., has purchased the entire equipment of J. G. Hinn.

As soon as possible the new firm will build a modern building to house an up-to-date creamery, ice cream factory, and pasteurizing plant. Until the new plant is completed, the new firm will operate the creamery business in the old creamery building.

Stock is now being subscribed for the new firm. They have already made plans for the building, and promise to make it one of the most modern plants in Laurens.

Manufacturers of Ice Cream Makers' Supplies and Certified Food Colors

They come and they go, but PURITY ICE CREAM POWDER holds fast. You can't get away from it; when you want a good reliable cream stabilizer you have to use Purity Powder. Should any difficulty be experienced when homogenizing by the mix becoming too thick, simply replace Purity by Red Seal Special Homo-Powder.

Ice Cream makers looking for quick and certain action in the Ripening tank use RED SEAL RIPENER. One ounce of Ripener to every fifty pounds of mix does the work. Just throw the "Ripener" in the holding tank and then stir it in.

RED SEAL GIANT VANILLA makes new friends every day. No one who uses Giant wants to try anything else.

RED SEAL COLORS. All shades.

LIQUID, PASTE, POWDER. Satisfaction guaranteed.

RED SEAL TRUE FRUIT FLAVORS. Ideal for ice cream.

ST. LOUIS

WARNER-JENKINSON CO.

WE are not interested in selling C.W. Brand Vanilla to the manufacturer whose only selling argument to his customers is that his ice cream is cheaper than his competitor's product.

We do want to sell C. W. Brand Vanilla to manufacturers who depend upon quality rather than price to keep their freezers going.

C.W. Brand Vanilla will make your present mix taste infinitely better because C.W. Brand Vanilla is as good as it is humanly possible to make it.

Would you not be willing to spend a fraction of a cent more per gallon of ice cream for flavor if you were assured that this were possible?

The Widlar Company of Cleveland, Ohio who manufacture C. W. Brand Vanilla will be glad to show you that your ice cream really can be made to taste better.

Depreciation of Ice Cream Equipment

Address of C. F. EURICH, Auditor, J. M. Horton Ice Cream Company, New York.
Before the National Association of Ice Cream Manufacturers

I wish to thank the president of this asscoiation, as well as the members of it, for the privilege of addressing this meeting.

I also wish to express my gratitude with the other members of this convention for being the guest of this beautiful and hospitable city.

C. F. EURICH

A joy has been produced that knows no bounds.

I feel something like the colored man, who was asked to deliver an oration on patriotism.

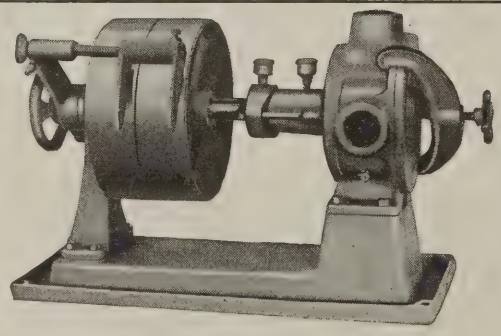
He was standing on a molasses barrel, and the head broke in. When he came up, he exclaimed, "Oh, that I had a thousand tongues to do this subject justice."

This subject of depreciation is not a serious one, nor am I going to attempt to treat it as such, knowing full well that it is usual in every industry.

Depreciation, of course, will always exist with material things.

I wish, however, I could offer a remedy for it, and thus eliminate, from our activity, a source of great loss.

A great deal has been said and written on the subject of depreciation of late.



Right now many books on the subject are being published.

The federal and other government authorities are directing their thoughts along these lines.

So much of the subject is in the very air that I perhaps had better confine my remarks more to the principle governing its application, rather than to the various methods of its use.

Anyone present wishing to discuss with me some question relative to this subject, I will be very glad to do so after this meeting, to give some concrete examples which are not possible in this address; feeling that it will be of mutual benefit and advantage to all concerned.

For CREAM

For BRINE

2" SANITARY VIKING PUMP
THE UNIVERSAL PUMP
For Milk, Brine, Water or Foods
VIKING PUMP COMPANY, Cedar Falls, Ia.

Depreciation may be defined as the impairment of the value of an asset, or the decreasing in value of an asset, by reason of wear and tear, due to its use or lack of use, and to inadequacy or obsolescence, resulting in inefficiency or uselessness of the asset; also through the exhaustion thereof.

It does not apply to inventories or stock in trade, nor to the land apart from the improvements added to it.

In the contemplation of this subject, it is essential to consider the following factors:

1. Improvements and Betterments: To this account should be charged such amounts as enhance the value of an asset.

2. Renewals and Replacements: To this account should be charged such amounts as continue the use or life of an asset.

3. Repairs: To this account should be charged such amounts as are merely incidental in keeping the assets in efficient operating condition.

It can be readily understood, where a concern has kept its plant and equipment in the highest possible state of efficiency, by reason of continued expenditures for improvements, replacements and repairs, that lower rates of depreciation would apply than where this policy has not been pursued.

It will be observed from the above statements that fixed or standard rates of depreciation to apply to all industries would not only be untheoretical, but would be entirely impractical.

This would likewise follow in industries along similar lines in the same locality, due to operating under conditions peculiar to its separate management and policy.

Consequently the rate at which depreciation may be claimed is contingent in a greater or less extent, upon local conditions, the use to which the property is put, and the probable lifetime of the asset under normal business conditions.

No specific rates at which depreciation may be claimed have ever been established by the federal authorities or by any other legal ruling.

The law states that a reasonable allowance may be taken.

Experience in any particular business by which knowledge is acquired as to the wear and tear to which the property is put, is the only practical means of arriving at a reasonable rate of depreciation.

What would be reasonable for one company might be most unreasonable for another.

Hence the depreciation deduction with respect to any property is such an amount as, in the aggregate, when the property as a whole is worn out, will replace it or will return to the business the capital invested in it.

The effect of past wear and tear and inadequacy can be ascertained within reasonably narrow limits.

The future effect of wear and tear, etc., although it cannot be anticipated with entire certainty, may also be determined, with a reasonable degree of accuracy, from the result of past experience.

The elements necessary to compute depreciation according to any scientific method are:

(1) The original cost.
(2) Residual, salvage, or scrap value—and
(3) The life of the asset.

Having determined these elements, the residual value, if any, having been deducted from the original cost, and the balance divided by the number of years esti-

This is one of a series of newspaper advertisements produced for the Supplee-Wills-Jones Company of Philadelphia to stimulate the sale of Ice Cream. It is part of a general campaign consisting of posters, display signs, window trims and other forms of attention compelling advertising that have helped make "Supplee" one of the largest selling Ice Creams in Philadelphia.

Supplee

Chocolate ICE CREAM

WHAT a fine rich flavor there is to Supplee Chocolate Ice Cream! It's always fresh, the quality never varies and you can get it every day in the year because it's always seasonable. Thousands of Philadelphians will enjoy Supplee Chocolate Ice Cream today. *Will you have some?*

The fine flavor is obtained by skilfully blending two different cocoa beans, a dark Brazil bean and a lighter one from the East Coast of Africa. A combination of the two, frozen with rich, thick cream, produces that fine color and lasting flavor that has made Supplee Chocolate Ice Cream famous in the Philadelphia district.

You can get it anywhere in town or the surrounding territory. Over three thousand dealers are selling it now. Supplee Ice Cream is made by Supplee-Wills-Jones, an organization that all Philadelphia knows for the excellence of its Gold Medal Dairy Products.

BARKER, DUFF & MORRIS · PITTSBURGH, PA.

mated to be the life of the asset, a result is obtained which gives an amount chargeable each year as depreciation.

This method is known as the straight line method or percentage method, and, from its very simplicity, makes it the most practical.

Another well known method—one also which is very practical—is the reducing balance plan, a constant percentage on the decreasing balance of the asset being charged off each year.

This inequality of charges is offset by the assumption that repairs and renewals cost least during the first few years, increasing as the years go on, and consequently tend to make the total cost of upkeep and depreciation more uniform.

The amount of the depreciation deduction thus ascertained should be credited to a Depreciation Reserve account.

Against this account should be charged the cost of renewing or replacing the specific property with respect to which depreciation is claimed.

Since a depreciation reserve is intended to take the place of the investment value which has been lost through wear and tear, etc., it would appear that if any considerable sum of money were spent on the property to take the place of some worn out part, such expenditure should be charged to the reserve, and not charged as an expense to the repairs account.

When the time comes to replace an asset, the depreciation reserve should be such an amount as will enable the business to charge off the old asset at its original cost or present book valuation to this account.

This is accomplished by an entry crediting the old asset and charging depreciation reserve.

This entry removes the old asset from the accounts and also closes the depreciation reserve account insofar as that particular asset is concerned.

Any expenditure that is made, enhancing the value of an asset, is an improvement or betterment, and should be treated as such.

Repairs in the nature of renewals and replacements, to the extent that they arrest deterioration and appreciably prolong the life of the property, should be charged against the depreciation reserve.

The expenditure for repairs, which do not add to the value of the property, but merely keep it ordinarily, in an efficient operating condition, may be taken as an expense of operation.

The repairs just mentioned refer only to such repairs as are incidental to the operation of the property, and as will not, if continued, while the component parts wear out and are restored, extend the life of the property.

At this point attention is called to the need of a careful distinction among improvements, renewals and repairs.

Automatic Cone Machines

with which you can make a better cone, at a less cost, than with any other known device.

CLEVELAND, OHIO

Only a clear definition of the terms and a strict adherence to an adopted policy can prevent endless confusion and misleading results.

In reaching a decision as to the rate of depreciation to be applied to the different classes of assets, it cannot be considered from the attitude of a closed plant or what these depreciable assets would bring at a forced sale; but must be considered from the attitude of the business being in continuous operation.

Neither should the fact that taxes are high or low, or that profits are large or small, influence the motive, but should be determined purely and exclusively on the basis of principle.

If thus considered, a result will naturally and inevitably be obtained which is just and equitable, not only for taxation purposes, but also for a correct determination of the cost of the product (which is very essential) and likewise for any financial purpose.

For your information and guidance I shall state here a number of assets, together with the general rates of depreciation pertaining to the ice cream industry.

The rates of depreciaiton, however, are only to be used insofar as they may reasonably apply to your need.

Building:	Per Cent per Year
Steel and stone structure	1½ to 2
Brick and stone	2 to 2½
Brick buildings	2 to 3
Brick and frame	3 to 3½
Frame buildings	4 to 5

Equipment:	
Automobiles, heavy type	12½ to 20
Automobiles, light type	20 to 25
Harness	16⅔ to 20
Horses	12½ to 15
Machinery	7 to 10
Milk Cans	20 to 25
Office Furniture and Fixtures	10 to 15
Refrigerators (cabinets)	16⅔ to 20
Tins	25 to 33⅓
Tubs	20 to 25
Wagons	12½ to 20

Each rate that I have just given is based on an estimated life of each asset, wherein all expenditures for repairs are assumed to be charged as an expense.

Depreciation rates on machinery are affected by so many factors, that the ideal method would be, to apply a particular rate to each machine, or part of equipment, which go to make up the machinery and equipment account.

With respect to milk cans, tins and tubs, I understand that a number of companies are charging the expenditures for these, direct to the expense account.

If at a subsequent time it develops that the rate of depreciation is too low or too high, a modified rate should be established, so that the extinguishment of the book value will occur with the elimination of the utility of the asset or assets.

It would be well to bear in mind, however, that the effort should be made to determine a rate in the beginning if possible so that no modification will be necessary.

Because changes of this character tend to influence the cost of the product, a haphazard method may prove costly.

The best that can be done is to make a fairly liberal estimate, based on past experience, and trust that it will be sufficient to keep the book value of fixed assets always well within the limits of actual value.

If the false impression and seeming confusion created when the subject of depreciation is discussed, were elimi-

FLAVOR YOUR ICE CREAM WITH

Cremilla

"CREMILLA" is better, smoother, creamier and of richer flavor than the finest grade of pure vanilla; and it's more economical.

"CREMILLA" is so concentrated as to make it the best flavor to use with homogenized cream; one-third to one-half oz. flavors perfectly 10 gallons of cream (one to one and a half pints for 500 gallons.)

Trial gallon by express on request. After fair trial, if you don't like it, send back what's left and pay us nothing.

National Fruit Flavor Co.
NEW ORLEANS, U. S. A.

nated, and the facts of the situation or conditions viewed impartially, and at no time be influenced by the size of the profits or losses, the terror of depreciation would be largely eliminated.

We all know that depreciation will depreciate with improvements in material things, as invention and research are bringing to light many ideas every day, which tend to serve the human race more efficiently.

DAVIS-WATKINS MACHINERY AT THE NATIONAL DAIRY SHOW.

One 12,000 pounds per hour Davis pasteurization outfit finished in white enamel with nickel trimmings.

One 600 cans per hour can washer, the same as recently installed and now working satisfactorily in the plant of the Crescent Creamery Co., Los Angeles, Calif.

One large pressure bottle washer, with automatic feed and special hot water sterilizing attachment.

One group of Model 5 rotary bottle fillers and cappers, with automatic feed and discharge unit.

One small Davis bottle washer.

One small Progress can washer.

One 8,000 pounds per hour flow type pasteurization outfit including: Economy holding tanks, economy heaters and coolers, Progress milk pumps and small Davis rotary bottle filler and capper.

One 800 gallons per hour Progress homogenizer, fully equipped with automatic oiling device and water drip for cooling the pistons.

Complete ice cream equipment, including: Progress batch mixers, Progress pasteurization vats, four sizes and styles of Progress ice cream freezers and Progress tubular cooler, etc.

Complete creamery outfit, including: The largest combined Disbrow churn and worker ever manufactured, having a capacity of 1,600 pounds of butter at a churning; Progress starter cans, Progress cream ripeners, Davis tubular cooler, Babcock testers, etc.

Two large Glascote milk holding tanks.

Complete display of dairymen's milk cans, ice cream cans, cheese cans, city delivery cans, etc.

The Davis-Watkins space was not as large as last year, and yet it contained more machinery. You will appreciate from this that the booth was quite crowded, still it was an exceptional exhibit because all of this machinery was white in color with nickel trimmings. It was very impressive, extremely attractive, and the booth was crowded most of the time.

The two Davis rotaries connected with automatic feed and discharge, and large Davis pressure bottle washer were operated for several hours during the day and evening by men from the plant of the Franklin Cooperative Creamery Association in Minneapolis. Hundreds of visitors made it a point to go over to Minneapolis and watch all this Davis equipment in actual operation in the Franklin plant. It may interest our readers to know that this large Franklin plant, which is, by the way, the largest milk plant in Minneapolis, was built up from nothing to sixty-nine wagons in five months' time. This is especially interesting, in view of the fact that they pay the same price for milk to producers, pay the same wage to their drivers, and sell milk for the same price as the other milk dealers in their city. This company is also working closely with the other dealers, and under the same bottle exchange arrangement.

WISCONSIN ASSOCIATION OF ICE CREAM MANUFACTURERS.

To Our Members and Associate Members:

Dear Sir:—Arrangements have been completed for our annual convention to be held at the Hotel Plankinton, Milwaukee, Wisconsin, January 17th and 18th, 1922, and I want every member to make arrangements to be in attendance, as it is for your benefit and the success of our association that you do attend. We do not want you to only pay your dues but want you to be present and lend your assistance at the convention.

I want at this time to ask every member to write to President D. D. Smith, Fond du Lac, Wis., making any suggestions they have for subjects or for people they would like to have on the program. These suggestions will all be given consideration and as many of them as possible used. Have all your suggestions in **not later than November 20th.**

Make your reservations now with the Hotel Plankinton and avoid any chance of its being overlooked.

The management advises us they are reserving the entire mezzanine floor, and for the information of associate members I would say that rooms on this floor for display purposes will be $10 per day.

Respectfully yours,

F. E. CAUGHEY,
Secretary-Treasurer.

Philosophy of the Street

It is a mistake to suppose that coloring the hair produces softening of the brain. The thing works the other way; it is softening of the brain that inspires the use of the dye.

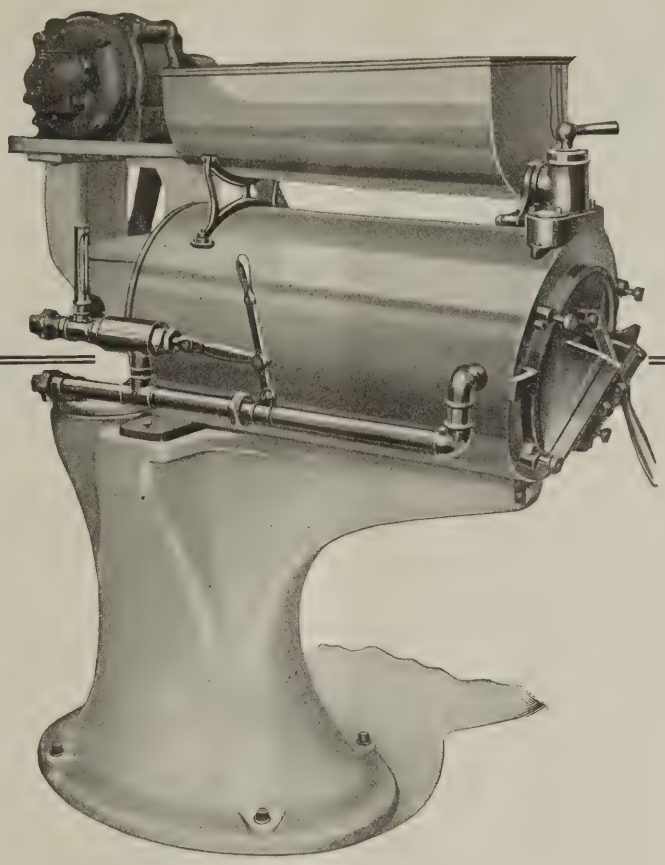
The Fifteenth Annual Show of the National Dairy Association Is History and What Wonderful History it Will Be!

By W. R. McEWEN

SO FAR as the J. G. Cherry Co. is concerned it was, by far the most successful exposition in which we have ever participated. We take this opportunity of publicly expressing our appreciation of the excellent manner in which the show was conducted by the management and to congratulate the various dairy organizations of the Northwest for the whole-hearted support they gave to the show which played so important a part in making the exposition such an emphatic success from every angle. We are frankly enthusiastic over the reception accorded our exhibit which was visited by hundreds of interested friends and customers. The keen interest shown throughout the entire week in the Cherry equipment on display amply repaid us for the considerable expense we incurred.



This view shows the installation of the Cherry Gravity System of Pasteurization which was operated continuously throughout Dairy Show week. (2) This part of the exhibit was just across the aisle from the main display and was fitted up with comfortable chairs and settees as well as a row of private offices in the rear. (3) A view taken under the balcony which formed a part of the Cherry Gravity System of Pasteurization.

The Cherry Gravity System of Pasteurization.

Without doubt the feature about the Cherry exhibit which attracted the greatest share of attention was the Cherry Gravity System of Pasteurization which was operated continuously throughout the show. A special elevation or platform had been erected on which was installed three 300-gallon Class B-2 Cherry pasteurizers. Here also was located the Cherry 3-in. tubs preheater, which is such an important part of this system. The milk was seen flowing over the preheater, through a clarifier, thence to the pasteurizers and from there directly over a Cherry 2-in. tubular cooler (fitted with dust shields.) This cooler was set up on the main floor level. From the cooler the milk passed through a Milwaukee bottle filler and then back and elevated again by a motor driven Viking pump to the preheater where the same course of flow was repeated. The system and its operation was graphically shown by this continuous flow of the milk and, as previously stated, attracted probably more attention than any other feature in the huge machinery hall. A substantial stairway was provided for visitors to ascend to the upper or pasteurizing level and this platform was always filled with an interested group watching the gentle, positive agitation of the Cherry twin coil on the vat content as it passed through on the way to the Cherry tubular cooler.

The Dreadnaught Churn.

The massive beauty of the Cherry Dreadnaught churn always attracts many interested spectators and the two Dreadnaughts shown at the show this year proved no exception. One of them was the standard

Higher Efficiency adds to Greater Economies

RIGHT at the beginning of the time to be preparing for putting in Brine Ice Cream Freezers, the EMERY THOMPSON comes forward with the 1922 improvement on greater brine circulating space and drawn nickel silver cylinders, giving the scraper true and accurate surface for freezing the smoothest and finest quality Ice Cream.

These are the kind of ideas in brine Ice Cream Freezer development which has maintained in the Emery Thompson freezer its long and noteworthy reputation.

Our machines will be shown at the Atlanta and Buffalo Fall Conventions, and we cordially invite you to call on us and see our big fine, heavy production freezers.

"Write for catalog and prompt delivery"

Emery Thompson Machine & Supply Company

271-275 Rider Avenue 6-8 Canal Place (Bronx) NEW YORK CITY

churn equipped with direct motor drive. It was a beautifully white enameled machine with dark blue trimmings. It was operated continuously throughout the week and many comments were made upon the noiselessness of the churn when in motion. How such a heavy piece of machinery can run so quietly is always a mystery to the uninitiated.

The other Dreadnaught churn was a special one, shorter than the regular machine with the end opposite the gearing partly cut away to show the position of the shelves and the famous Cherry single roll feature with which this churn and the Cherry Perfection are equipped.

The space occupied by the Cherry Co. included not only a large area in the open space of the machinery hall but just across the aisle and under the mezzanine or balcony was a reception enclosure along the back of which were a series of small offices, each completely equipped with desk and comfortable chairs where many important conferences were held during the week and where customers could meet salesmen of the company in the utmost privacy. It was an arrangement that was appreciated by the many who made use of this convenience.

Other Machines in the Cherry Exhibit.

Included in the complete line shown by the Cherry Co., in addition to those machines already mentioned, were three Model 60 Dreadnaught freezers, two of them direct motor drive and the other belt drive. One of these freezers was also equippd with the Thomas batch measure which is so rapidly becoming popular with the ice cream manufacturers. The other freezers were the Cherry Model 50, both motor and belt driven, and the Model 40 in both the belt and motor drive.

There were five different types and sizes of Cherry ice cream batch mixers shown. The largest was a 500 gallon Class B-1 steel body mixer equipped with self-circulating tank and finished in white enamel. There was also a 200-gallon machine of the same classification and fitted for belt drive. Then there was a 100 gallon Model A upright batch mixer equipped with direct connected ¼ H. P. motor drive. The other upright batch mixers shown included a 75 gallon Model B and a 50 gallon Model C mixer. All were finished in a beautiful white enamel.

Included in the other ice cream machinery shown was the Cherry ice cream can washer and sterilizer. This was also fitted up for direct motor drive and attracted much favorable attention.

New Types of Coil Machines.

Of course, there was a complete showing of the Cherry line of coil machines. Besides the three pasteurizing machines already mentioned there was on display a 1,000 gallon steel ripener and pasteurizer (Class B-2); a 600 gallon Class C ripener and pasteurizer. This was a glass lined machine, steel body, fitted with a 2-inch Cherry twin coil and finished in white enamel. Then there was a 500 gallon Class D pasteurizer with direct motor drive. This was a vitrified enamel body, copper lining and the Cherry twin coil. The 300 gallon Class E pasteurizer shown was a glass lined machine with a vitrified enamel body and was direct connected with motor.

One of the newer types of Cherry coil machines was the Class F pasteurizer. The size exhibited was a 500 gallon capacity. It was a belt driven machine finished in white enamel. The Class F pasteurizer is a skeleton frame machine which supports a glass lining. The gearing is mounted on strong steel supporting iron which is fastened securely to the heavy "bridge iron" which forms the skeleton framework. This new addition to the Cherry line of coil machines has been designed to provide a less expensive glass lined coil vat for the cream, ice cream plant and city milk plant. It can be furnished as a ripener, pasteurizer or batch mixer just the same as any other class or model.

The Cherry Condensed Milk Cooler.

Unquestionably the feature directly responsible for the keen interest displayed in the Cherry two coil condensed milk cooler displayed is the very evident saving of time in cooling which can be effected with this machine.

The two coils with which this cooler is equipped have much to do, no doubt, with its cooling efficiency. Another feature which has a great bearing on this matter of cooling is the special circulating tank which is a part of this outfit. This tank is fitted with a set of three brine or ammonia coils, assuring a temperature of circulating water as low as the operator wishes to take it. In an actual test made where 10 degree brine was used it was found possible to repeatedly cool a product containing 8 per cent fat and 33 per cent solids from 130 degrees to 44 degrees in the remarkably short time of two hours flat. This test was made with 600 gallons of product.

The cooler displayed was a 700 gallon capacity machine and was complete with the special circulating tank as shown.

Other Equipment in the Cherry Exhibit.

Other equipment shown by the Cherry Co. included a 500 gallon Cherry buttermilk machine of 500 gallons capacity. This was a steel body machine equipped with special blades on the coil and was fitted with the Cherry two-speed clutch pulley drive.

In addition to the cooler included in the Cherry

gravity system of pasteurization was a 2-inch Cherry tubular cooler and a 1½ inch tubular cooler.

Of course, the Friday printer was shown as well as the Capper paraffiner, Haugdahl starter can, the new style end dumping Cherry forewarmer, and No. 6 Cherry continuous cream pasteurizers.

A Small Pasteurizing Outfit.

Without question that part of the Cherry exhibit of greatest interest to the smaller milk dealer was the Cherry Junior pasteurizing outfit. This is a complete pasteurizing and cooling unit. It includes an upright pasteurizer similar to the Haugdahl starter can in appearance, a tubular cooler of the right size, and a bottle filler. The pump for elevating the milk from the pasteurizer over the cooler is mounted direct on the pasteurizer. Included in the outfit are all the necessary sanitary fittings and the jack shaft for belting from the motor to the pasteurizer. It is a complete unit in every detail and a mighty attractive as well as inexpensive outfit for the smaller dealer.

The Booth on Our Right at the National Dairy Show.

The Cherry Banquet.

As in past years, the Cherry exhibit at the show this year was under the direct supervision of S. J. Van Kuren, the head of the factory sales department. He had assisting him throughout the week fifty men from the sales and production forces and even then there were many visitors who were not given the attention the company would like to have given them. Mr. Van Kuren asked us particularly to apologize for any inattentions which may have arisen. It was simply impossible because of the immense attendance to give each individual who visited the exhibit the attention he deserved.

On Wednesday evening, October 12th, the executives of the twenty-five companies who have the exclusive sale of Cherry equipment in all parts of the United States and Canada were the guests of the company at an excellent dinner provided for them by a famous St. Paul chef at the Northland Country Club, about ten miles north of the city. Automobiles were in readiness at five o'clock and whisked the party off through the beautiful parks and over the fine country roads to a destination none of them knew a thing about. In issuing invitations to the dinner Mr. Van Kuren had only made the statement that they were to be ready at the appointed hour and that the affair was to be different than previous banquets. He certainly was right. It was different. It was a keen pleasure to take that drive into the country and to arrive just in time for a wonderful dinner. There were no after dinner speeches. When the meal had been consumed (and it was, with a relish), the rest of the evening was devoted to any amusement the members of the party saw fit to indulge in, and it was not until midnight that anyone thought of the hour and started back to the city. It was indeed different and thoroughly enjoyed by every member of the party.

Transporting Milk 140 Miles in Elyria Glass Enameled Tanks

THE efficiency and economy of Elyria Glass Enameled Tanks in transporting milk is well illustrated by the results accomplished by the United Milk Company of San Fransisco. Five tanks [two mounted on trucks and three on trailers] are used to haul milk from the receiving station at Soledad to the main plant at San Fransisco—*a distance of* 140 *miles.* Observations made under working conditions prove *beyond shadow of doubt* —that transportation in Elyria Tanks is the only practical, efficient and economical method for the modern milk plant to use.

Results Effected

Thirty-three hundred gallons of milk carried in one trip as against three thousand under old method; thirteen hours time required to make trip; time saved loading and emptying tanks; increase of only two degrees in temperature compared with 15 degrees when milk was hauled in cans; no loss of milk due to spillage or careless handling; rehandling of cans eliminated; help maintain higher quality of product; increase efficiency and simplify operations; prevent contamination.

We shall be glad to send you complete details of the United Milk Company plan of operation and show you how Elyria Tanks will serve you profitably and well. Write for proof of Elyria superiority in Milk and Ice Cream plants—large and small.

WHAT BANKERS THINK OF ICE CREAM MANUFACTURERS.

Perhaps you've never quite thought of it this way, but, it does matter a whole lot to the industry as a class, and to you, as an individual; what Mr. Banker thinks both of the industry and of you as an individual.

In this connection we believe the following extracts from a statement made by a certain banker may interest readers of this publication.

Briefly summed up, you'll gather that this particular banker (and there are many like him) expects the ice cream manufacturer to be a good merchandiser of ice cream as well as a good maker of it.

His statement is, in part, as follows:

"Whenever we are dealing with other people, we are placed in the position of servants. If we make goods which we intend to sell, we must put the best quality in these goods that conditions will permit.

"Unless we are honest in the work we do, unless we are honest in our desire to serve, we have not laid a single stone in the foundation of our achievement. Some ice cream manufacturers are perhaps building a structure that they mistake for a success, but it is only a superstructure—they have neglected the foundation.

"During a season when the trade is forced to come to them they may show remarkable money-making results, but in another season, when they have real competition their houses of cards will have fallen.

"Some ice cream manufacturers believe that when they give their dealers excellent delivery service they have completed the service end of their requirements, when as a matter of fact they have just begun. They have just touched upon the important service end of their business, or the main foundation stones.

"When your ice cream is delivered to a store it must be dispensed properly by the dealer or two things may happen; first, the public will not like your goods; second, the dealer will not consider the ice cream business profitable. The majority of ice cream manufacturers neglect their dealers. They assume that their dealers know all about ice cream, how it is made, how to take care of it after it arrives and how to sell it; whereas, facts show that a great many dealers do not know how to take care of it and the great majority of them certainly do not know how to sell it.

"Ice cream today is largely sold by the weather. As a matter of fact, it should be sold by good merchandising in all kinds of weather, bad, indifferent or good. This fact is proven clearly and is demonstrated daily by those small number of dealers who understand how to sell ice cream and who sell it continually, winter and summer, rainy days or beautiful sunshiny days.

"A dealer of ice cream should be considered as your salesman, not as some dealer. He should be coached in selling. He should be taught the importance of selling more ice cream. He should be given hints and suggestions on how to make his soda fountain and soda parlor inviting. He should be told the cost of advertising material furnished him so that he will not waste it. He should be shown the value of displaying this advertising material properly.

"But so many ice cream manufacturers say, "Yes, this is true. He should be shown, but can he be shown?" Please remember that every dealer is as anxious to make money as you are and that if your salesmen who go from your plant to his store know how to sell not only ice cream, but your merchandising and advertising service, that dealer will appreciate your ideas because your ideas make him money.

"How many ice cream plants have thoroughly instructed their own salesmen how to sell the dealer? From my investigation as a banker I find there are very few manufacturers of ice cream devoting anywhere near enough attention to this great work.

"I know of a case where an ice cream manufacturer paid from $2.50 to $3.50 for a handsome cut-out and sent it out to one of his dealers to display. Twenty-four hours afterwards he went up to see the display and it could not be found, after a search this display card was found at the bottom of a paper bailer, destroyed. I blame the ice cream manufacturer more than I do the dealer. If that ice cream manufacturer had sent a salesman or gone himself to the dealer and told him something as follows this would not have happened. He might have told the dealer: 'Mr. Jones, here is one of the most beautiful cards that we have ever purchased. The cost is approximately $3.50. It should be good for a place in your store for the next thirty days. If we are willing to pay $3.50 for this placard to display your store to sell more of your ice cream for you, we know you will be willing to give us a space and keep the placard in that space."

"If this dealer had been sold the advertising on the idea that it would produce results for him and on the idea that this advertising costs money he would have either taken the placard and kept it in its place, or advised them that he had too many placards and could not use it at present. He would not have put it in the paper bailer. What is the use of purchasing large supplies of advertising material unless your own sales organization tells dealers how to get it displayed."

It is a matter for congratulation that the ice cream industry is served by a number of concerns of a very high type, and, ranking high amongst these is the Frederick C. Mathews Company of Detroit, Michigan. This

An Everlasting Asset

A NEW plant or the modernization of an old one—is a broad stroke of business progress. It is the fulfillment of an ambition and an investment expected to serve present needs and future expansion requirements. To make certain this ambition and investment will be an everlasting asset —not a continuous expense—justifies extreme care in the selection of plans as well as in the construction specifications and erection details.

McCormick ARCHITECTURAL and ENGINEERING Service

first of all, is an assurance that your plant will operate at a minimum cost for labor; it protects you from expensive blunders and miscalculations; it relieves you of the mass of intricate details incident to construction; it removes all uncertainties and speculative factors, and delivers the completed plant exactly as you want it and according to the plans and specifications worked out and approved before starting the work.

A remarkable feature of McCORMICK SERVICE is its low relative cost. It invariably pays for itself the first year. No matter how large or small the job, you will find the McCormick organization of experienced ice cream and dairy engineers can be of valuable and economical service to you.

You may find out what McCORMICK SERVICE can do for you without any obligation whatever. A letter of inquiry is sufficient.

Construction Executed by Your Own Local Contractor Under the Direction of Our Visiting Superintendents

concern has had a most phenomenal growth, rising, in a few years, from small beginnings, to a business of very great annual volume. The founder of the business is himself recognized as a foremost exponent of ice cream merchandising methods and he is sufficiently broad-gauged that he has gathered around him a number of very able lieutenants who are constantly going up and down the breadth and length of the land and making themselves helpful to the trade by merchandising advice and suggestions of immense practical value.

To those of our readers who would benefit (and they are numerous) by coming in contact with this live organization we suggest a call at the booth which this company will have at the forthcoming exposition of Ice Cream Supply Men, where a notable displayer of material will be shown and where several of the "Mathews" exponents will be in attendance.

This booth will be a center where ideas may be exchanged and where the ice cream manufacturer with almost any kind of merchandising problem may meet with the most intelligent kind of receptiveness and receive suggestions for plans for merchandising which will impress him as sound, practical and productive.

CHAPMAN & MORRIS SELL OUT.

Geo. A. Chapman and A. D. Morris have disposed of their interests in, and severed their connections with the Peerless Ice Cream Co., of Kansas City, Mo. Mr. Lewis H. Aines is the new proprietor and general manager.

Ice Cream, Present and Future

Makers of ice cream who assembled here from all parts of the country visualized in a very impressive way the scope of this industry in the United States.

As George Ade might put it, ours is "the ice cream eatingest country in the world". Consumption of this food delicacy has grown amazingly. The process has been facilitated, say the manufacturers thereof, by the prohibition laws. A still more important stimulus, in all probability, is to be traced back to the man who first thought of and put forth the ice cream cone, whoever he may have been. That device far antedates the coming of prohibition as a countrywide policy.

The ice cream cone has come to be looked upon in the realm of American childhood as veritably "the horn of plenty". It has its immense following now among the grown-ups. Any summer-time gathering in the land where ice cream figures as a commercialized article would be an anomaly if it were lacking in cones filled with ice cream. For a goodly part of the year these cornucopias of sweetness enter largely into the business of the corner grocer, the druggist, the candy maker and others.

Ice cream lies at the base—figuratively speaking—of the soda water fountain, and it is at the soda fountain better than elsewhere that the reflex effect of prohibition on the ice cream traffic is observed.

We speak of this product as a food delicacy. The words are most fitly chosen. Ice cream, if properly made, is an admirable food, and there is no question of its ability to please the palate of baby, youth or adult. More often than any other so-called dessert it plays a role at banquets, in hotels and cafes, and for home dinners.

It is good to be told that one of the aims of the convention of manufacturers in Minneapolis was to create a countrywide sentiment for the making of ice cream which shall be purer in content and richer in food values.

Ice Cream Containers, Milk Bottle Caps, Big Dishes of Ice Cream and Hearty Welcomes Were Their Specialties. 1921 National Dairy Show.

Whether there shall be still further enlargement of ice cream consumption both as a gustatory delight and as a nurturing thing for the human body depends largely on the manufacturers—on the quality of the product and the means used to make the virtues of the output known to the public. The limit of the possibilities of the business has not yet been reached. The field spreads out far and invitingly. Science and hygiene are frankly on the side of good ice cream—Minneapolis, Minn., Tribune.

Gentlemen:

Having used one of your Condensers for sometime, we are so well pleased with its merits and the product that it produces that we gladly recommend same to all that might be desirous of turning their skim and surplus milk into money.

At this time of the year we are using our whole milk and butter, and by condensing it slightly we get the finest mix, and the best ice cream ever produced.

We find that by using your Condenser that we are saving the money, you claimed we would.

Yours very truly,

Stroudsburg Creamery Co.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—We are having some complaints on our ice cream. The dealers say it has a slight starchy taste when it begins to soften up. We use the following mix:

Thirty-five gal. 3.5 per cent milk, 50 lbs. butter, 34 lbs. sugar, 55 lbs. sweetened condensed (or 5 gal), 3 lbs. gelatine, 9 oz. Meloine, 32 oz. creamex, 25 lbs. water. This makes about 49 gals. mix which freezes out from 90 to 93 gals. ice cream after aging about 20 hours.

Please figure this mix and state whether or not we come up to the state standard. Any criticism or suggestion you have to offer on this mix will be greatly appreciated.

If it is convenient for you I would be glad to ship you a sample of our cream and have you score it.

Yours very truly, A. C. R.

Reply: I have analyzed your ice cream mix and you will find the calculations given below in Table No. 1:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
301 lbs. 3.5% milk	10.5	25.99	36.49
50 lbs. 84% butter	42.0	.....	42.00
34 lbs. sugar	...	.....	22.30
55 lbs. sweet cond. milk	...	14.85	36.85
3 lbs. gelatine	...	.....	2.85
2.5 lbs. Meloine and Creamex	...	.....	2.37
25 lbs. water	...	.....	.....
470.5 lbs.	52.5	40.84	152.86
Per cents	11.17	8.7	32.52

The slight starchy taste which you state your dealers object to is caused by the large amount of ripener which is used in your mix. I think if you will cut out about three-fourths of the Meloine and Creamex and use a little more gelatine you will find that your trade will not have this objection.

We are hardly in a position to score a sample of your ice cream at this time. You probably remember, however, that we have a one weeks' short course for ice cream makers, which will be given this year beginning the week of December 26th. We shall be very glad to have you come to this course this winter, and also to have you bring a sample of your ice cream to be scored. Last year we had a very interesting score contest and we hope to have it much better and more interesting this year.

* * *

Dear Sir:—We submit herewith formula for ice cream mix which is causing us trouble with sandiness:

637 pounds 15 per cent cream, 20 gals. condensed skim, 30 lbs. skim milk powder, 70 lbs. sugar, 35 lbs. glucose, 6 lbs. gelatine.

The above is the contents of the mix, which we are at present using, and causing us much trouble with sandy ice cream after it has been kept for some time. This mix is pasteurized to 165 degrees, viscolized at 120 degrees F. We obtained 100 per cent overrun and keep it at that all the time.

Would appreciate very much if you could show us wherein the fault lies. Is it in the mix itself, or the temperature at which the finished ice cream is held after freezing, which caused the sandiness?

Very truly, C. C. CO.

Reply: I have analyzed your formula and you will find the calculations given below in Table No. 1:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
637 lbs. 15% cream	95.55	47.35	152.90
180 lbs. cond. skim 30%		54.00	54.00
30 lbs. skim milk powder		28.50	28.50
70 lbs. sugar			66.50
35 lbs. glucose			24.50
6 lbs gelatine			5.70
958 lbs. mix	95.55	129.85	332.10
Per cent	9.55	13.5	34.5

Per cent sugar, 9.36.

I can easily see where you have had trouble with sandy ice cream. You are using too high a percentage of milk serum solids. I have never recommended the use of more than 11 per cent milk serum for ice cream containing about 10 per cent butterfat. You will also notice the percent of sugar you are using is very low. I am presuming that the 20 gallons of condensed skim milk which you are using does not contain any sugar because if this was the regular sweet condensed milk you would again have too large amount of sugar and over 40 per cent total solids. You can easily remedy your trouble by changing your formula. I suggest that you reduce the amount of skim milk powder from 30 lbs. to 10 lbs. and also you increase your sugar to 12 per cent, which means you would have to have 30.4 lbs. more sugar. I am suggesting a completely revised formula for you in Table No. 2:

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
637 lbs. 15% cream	95.55	47.35	152.90
180 lbs. skim condensed		54.00	54.00
10 lbs. skim powder		9.50	9.50
100.4 lbs. sugar			95.38
35 lbs. glucose			24.50
6 lbs. gelatine			5.70
31.6 lbs. water			
1000	95.55	110.85	341.98
Per cents	9.55	11.08	34.19

Per cent sugar, 12.0.

In case you have any further trouble, or if there is anything which you do not understand, I shall be glad to have you write me again.

* * *

Dear Sir:—Please send formula, worked out in gallons, for a 150 gallon mix, using 4 per cent milk, 20 per cent cream, and 8 per cent condensed, carrying 8 per cent butterfat and 34 to 36 total solids or whatever is required to make a good smooth cream. Also send rules so I can figure per cent of butterfat and total solids in ice cream mix. A. A. R.

I am suggesting below in Table No. 1 a mix containing the ingredients which you stated in your letter. You will notice that this mix calls for a large amount of condensed milk. I hardly know whether you would want to use such a large amount. You will notice, however, that the total solids, even with 14 per cent sugar, amounts to **31.6 per cent**, and not 34 to 36 per cent, as you wanted it to. You have to use too large an amount of skim milk to make an 8 per cent butterfat ice cream testing 36 per cent total solids.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
185 lbs. sugar			175.75
6.6 lbs. gelatine			6.20
396 lbs. condensed	31.68	71.28	102.96
208 lbs. 20% cream	56.00	19.94	75.94
452.4 lbs. 4% milk	18.09	38.65	56.74
1320 lbs. mix (150 gallons 8.8 lbs. to gal.)	105.77	129.87	417.59
Per cents	8	9.9	31.63

Machine

Westerlin & Campbell Company
CHICAGO, ILL.
J. G. HAMMERSCHLAG, *Wisconsin Manager*
1011 Majestic Bldg., Milwaukee, Wis.

I suggest that you try out this formula and let me know what you think of the product. You could possibly use skim milk solids in the form of skim milk powder instead of the 8 per cent butterfat condensed milk.

I should be glad to hear from you again, and suggest another formula to you using skim milk powder.

* * *

Dear Sir:—We wish to produce ice cream that will give a butterfat of between 8 and 9 per cent. We wish to use skim milk, condensed, 3.5 per cent milk, and cream. What per cent cream would be required and what proportions of each should be used in mixing 5 gallons of the raw product? We use a brine freezer, but have no homogenizer nor viscolizer.

Yours truly, D. I. C. CO.

Reply: I am glad to suggest to you below in Table No. 1 a 100 -pound ice cream mix made from the ingredients which you suggested in your letter. This mix will make 20 gallons of ice cream testing 9 per cent butterfat. I am sure you will have no trouble in securing a satisfactory product from this mix:

Table No. 1.

100 lbs. mix, 20 gallons ice cream, 9 per cent fat.

Ingredients	Fat	Serum Solids	Total Solids
14 lbs. sugar	....	.....	13.30
1 lb. gel. and flavor, 10 oz. gel.		.....	.60
16 lbs. cond. skim milk	....	5.44	5.44
25 lbs. 30% cream	7.50	1.52	9.02
44 lbs. 3.5% milk	1.54	3.64	5.18
100 lbs.	9.04	10.60	33.54

* * *

Dear Sir:—Would like to have your opinion on using whole milk sweetened condensed testing 8 per cent butterfat, sugar 43 per cent, total solids 73 per cent. In place of evaporated whole milk cond. fat 8 per cent, total solids 30 per cent. We seem to have trouble in getting the whip. We use 620 pounds to a 800 gallon batch of finished cream. Using milk, cream, butter and condensed. We are aiming to have a 12 per cent cream with 35 per cent solids. When we use the plain condensed we have no trouble in getting 100 per cent overrun, but just as soon as we use the sweetened condensed we seem to have trouble. We can get the 100 per cent all right but it takes too long to whip, using the same formula in both cases. So I can only lay it to the sweetened condensed.

Yours respectfully, C. S. P.

Reply: I am not able to suggest just what is causing your trouble, as we do not seem to have this trouble here in Oklahoma where we use sweetened condensed milk to a large extent. I suggest that you give me an outline showing all the ingredients of your mix and I shall be glad to look into the matter further and try to locate your trouble.

It is possible that if you aged your mix a little longer that you would secure the overrun more easily. You are probably using the mix with a higher solids contents when you use the sweetened condensed milk than when you use the plain condensed milk and this may be the reason for the difficulty in securing the overrun. I know that it is possible to handle the sweetened condensed milk so that you should experience no difficulty.

* * *

Dear Sir:—Allow us one question to begin with: Using powdered skim milk, instead of condensed milk what formula do you recommend for a 100-pound mix to make a 12 per cent ice cream, using a 25 per cent cream? Yours very truly, W. E. & SON.

Reply: I am glad to suggest to you below, in Table No. 1, a formula for a 100 pound ice cream mix testing 12 per cent butterfat, using powdered skim milk instead of condensed milk. I suggest that you try out this mix, and if you do not find it satisfactory just tell me what the trouble is and I shall be glad to offer further suggestions:

Table No. 1.

100 lbs. mix, 12 per cent butterfat.

Ingredients	Fat	Serum Solids	Total Solids
12 lbs. sugar	....	.....	11.40
1 lb. gelatine and flavor	....	.....	.75
4 lbs. skim milk powder	....	3.80	3.80
42 lbs. 25% cream	10.50	2.85	13.35
41 lbs. 4% milk	1.64	4.38	6.02
100 lbs.	12.14	11.93	35.32

* * *

We are making our mix as follows: 1300 lbs. milk testing 3.3, 335 lbs. sweetened skim milk condensed 40 per cent sugar, 105 lbs. sugar, 300 lbs. sweet butter 84 per cent, 3 lbs. Meloine, 67 lbs. gelatine, water and flavor (gelatine 12 lbs.).

We are homogenizing, temperature 160, pressure 2500 lbs. with a Mantin-Gaulin Homogenizer, aging about 36 hours before freezing. We get an overrun of 90 per cent. We always keep our freeze room below zero.

We are troubled with our ice cream falling down in the can. This is not noticeable at the time we are making shipment but when it arrives at destination. The cream does not get soft or watery but is hard in the can when it falls. What would you suggest to remedy this? How much total solids have we in the above? Would you recommend any change in the ingredients? Very truly yours, K. P. CO.

Reply: I have analyzed your ice cream mix below in Table No. 1. You will notice that you seem to have plenty of total solids and I hardly know what should be the cause of your ice cream falling down in the cans when shipped. I am wondering whether you have this condition in all of your cream, or just an occasional can. It is possible that the cans are not filled properly when the ice cream is drawn from the freezer. If drawn too rapidly into a can you are liable to have air pockets of considerable size which will cause it to fall. It is also probable that you are securing more overrun than 90 per cent as you state. You should not get over 470 gallons of ice cream from the 2110 lb. mix if your overrun is as much as 90 per cent or less. Your ice cream should not weigh less than 4.5 lbs. to a gallon. If it does your overrun is higher than 90 per cent.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
1300 lbs. 3.3% milk	42.9	111.88	154.75
335 lbs. condensed	....	90.45	224.45
105 lbs. sugar	....	.....	99.75
300 lbs. sweet butter 84%	252.0	.....	252.00
3 lbs. meloine	....	.....	2.70
12 lbs. gelatine	....	.....	11.40
55 lbs. water & flavor	....	.....	.....
2110 lbs.	294.9	202.33	745.08
Per cent	13.9%	9.5 %	35.3 %

Per cent Gelatine .56%
Per cent Sugar 11.3%
Gallons ice cream 460—90% overrun weighs 4.5 lbs. to gal.

I suggest that you go over this matter very carefully and see if you can locate the trouble. If not, I would be glad to have further details as to just how much trouble you have. You might try using a little more gelatine and a little less of the meloine if you continue to have the trouble.

Increases Winter Business

Think what it would mean to you to ask thousands of customers their first choice of fruit, and flavors, and then offer those same customers a combination of a dozen or more of those first choice fruits and flavors, made into a **Supremely Delicious Ice Cream.**

Blanke-Baer Honey Fruit Salad

DALY BROS.

SCHENECTADY N. Y.

Dear Sir:—A friend of mine told me he made his cream that you admired so much with 4 oz. of pure gum tragacanth to the 10 gal. mix, and through a secret process get it all in the mix. I would like your opinion as to whether or not it is possible to put that much gum into a mix. Yours truly, D. W. P.

Reply: Many ice cream factories prefer to use gum to gelatine, and it is easily possible to incorporate 4 ozs. of gum to a 100-lb. mix. The usual method of handling this gum is to mix the finely powdered material thoroughly with the sugar and then stir it into the mix with sufficient agitation to thoroughly incorporate.

* * *

Dear Sir:—When you were here you said you were experimenting with a 12 per cent B. F. 35 per cent T. S. mix. I would like very much to know what your results were.

I have been experimenting with a 14 per cent B. F. 36 per cent T. S. mix made from sweet butter and find that I have some trouble in keeping it from churning in the freezer after it has been through a viscolizer.

I would appreciate any information as to whether you can get a true emulsion of butter in a 14 per cent mix, as I have not gotten good results.

Yours truly, C. E. K.

Reply: We are getting very excellent results from our ice cream mix, which has a composition of 12 per cent butterfat and 34.5 per cent total solids. We are securing an overrun of about 100 per cent continually and our product is more satisfactory than the 10 to 32.5 per cent was last season.

I can see no reason why you should not secure good results with your 14 per cent mix. If your mix is properly emulsified or viscolized and at a low enough temperature when entering the freezer, you should have no more trouble with the possible churning back of the mix than you would with a 14 per cent mix.

* * *

Dear Sir:—We are having considerable trouble with our ice cream becoming soft in the bottom of the can, and we are sending you our formula, and if you can give us any information to eliminate this trouble we will greatly appreciate it:

Ingredients	Fat	Serum Solids	Total Solids
744 lbs. 4½% milk	33.4	63.95	97.35
84 lbs. butter	70.5	.....	70.5
120 lbs. sugar	....	.....	114.0
4 lbs. gum	....	.....	.....
4 lbs. extract	....	.....	6.0
72 lbs. milk powder	....	68.40	68.40
	103.9	.....	356.25

Gallons manufactured, 228; brine temperature, 12 degrees; time taken to freeze mix, 14 minutes; temperature of brine in storage tanks, 20 degrees above zero.

We run the entire mix, with the exception of extract through the emulser after it has been pasteurized to 150 degrees and held 30 minutes. We are using a Simplex Emulser, which operates about like a De Laval. The disc runs around 12,000 to 14,000 revolutions per minute, anything that will go through the milk pump will go through this machine. We also find that in cooling down the batch after it is emulsified, it will not freeze to the coils on the mixer, when the temperature of the mix is as low as 30 degrees, or 2 degrees below freezing. By using a mix that has not been run through the emulser we freeze the mix on the coils at a temperature of 32 degrees. We are wondering if the emulsification of this cream has any effect on the freezing in the storage tank, we have no

trouble in freezing the mix in the freezers. The mix is drawn from the freezer at a temperature of 28 degrees. We freeze our mix up 2 hours after it has been emulsified as it takes about that long to cool it down to 40 degrees. We find by holding it 12 hours we are unable to control our overrun. We get too much. Last year we did not pasteurize or emulsify our mix, but we find we are using considerable more ice and salt this year to keep our cream in good shape, than we did last year. However, we did not use as much milk solids last year as we are using this year. Our mix last year run 10 per cent fat, 30 per cent solids, and 75 to 85 per cent overrun.

Should ice cream with 100 per cent overrun have a lower storage temperature than cream with 75 per cent overrun, to keep it in good condition? Does emulsified cream take a lower temperature than cream made from pure milk and cream, in order to keep it in good condition? What proportion of salt and ice should be used in packing ice cream? Does the heating of gum have any effect on it, as to decreasing its strength?

Yours respectfully, K. C.

Reply: You have calculated your mix correctly and you should have no trouble in securing a satisfactory ice cream form this mix.

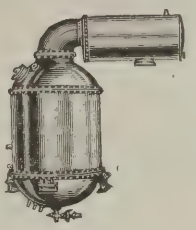
The soft ice cream in the bottom of your cans is due to too high a temperature of the brine in your packing box. Twenty degrees above zero is too high a temperature to hold ice cream. You should have a temperature of at least 10 degrees in your brine box. Your trouble is undoubtedly caused by the brine which you think is 20 degrees getting considerable warmer, perhaps 30 degrees or more, which will melt the cream in the bottom of your container. It will remain hard farther up in your container because your can is not setting in the brine like it is in the bottom. If you will reduce the amount of brine in your packing box you will have no more trouble in that respect.

Ice cream with 100 per cent overrun requires a lower hardening temperature than does one with 75 per cent overrun. It will, however, remain hard easier than one with lower overrun and emulsified ice cream does not require a lower temperature of storage than a cream made from pure milk and cream.

It is hardly possible for me to give you the correct proportion of salt and ice to use to keep the cream in good condition in your packing box. You will have to experiment yourself just how this must be done. However, I believe if you will keep the brine out of the bottom of your box or at least reduce the amount you will have no further trouble.

The heating of the gum will have no effect on decreasing it's strength, and you can easily mix your gum with the rest of the mix before pasteurizing and emulsifying.

* * *



Dear Sir:—We are desirous of obtaining information which will help us to solve a problem which we very often have to contend with in ice cream mixes. In the preparation of commercial ice cream it is desirable to use a high proportion of serum solids. This, however, is apt to approach a critical point at which "sandiness" develops.

We have made investigation, both practical and chemical, and we are anxious to secure all possible additional data which will enable us to meet the situation. Will you, therefore, kindly furnish us with such information as you may have available along the lines embodied in the attached questionnaire:

1. In you opinion, what is the cause of "sandiness" in ice cream?

Condensary and Dairy Equipment Manufacturers Since 1878

MANNING MANUFACTURING COMPANY
Rutland, Vermont

MANNING EQUIPMENT

2. What investigation have you made to determine the cause?

3. Have you determined that lactose in super-concentration in ice cream is responsible?

4. In determining lactose in mix what method did you follow?

5. Has acidity, the presence of other sugars, improvers or thickeners, any value in checking "sandiness"?

6. At what concentration at freezer temperature does lactose crystallize out?

7. Have you data showing variation in the proportion of lactose to solids-not-fat in cow's milk?

8. Is this variation affected by the feeding, season, or lactation period?

9. In your opinion how may "sandiness" be avoided?

10. Can you refer to any other authority for additional information?

Very truly yours, S. T. N.

Reply: I have made some investigation upon this matter and we also have this matter under further study at this time.

My conclusions at this time are that the "sandiness" was caused by a super-concentration of lactose or milk sugar in the ice cream mix. This is, of course, due to a high per cent of milk serum solids in the mix. We have found that when 11 per cent or more of the milk serum solids are used in a formula containing 12 per cent sugar and 10 per cent butterfat with one-half of one per cent gelatine the "sandiness" does not appear. When, however, the serum solids are increased above that point there is danger of securing "sandiness" in the ice cream.

In my opinion gelatine, on account of its perfect collodial properties, assists greatly in preventing the re-crystallization of the lactose. Larger amounts of gelatine added to the ice cream mix would prevent "sandiness", even if more than 13 or 14 per cent milk serum solids was used but you understand it is impossible to increase the gelatine above a certain per cent, as it would not make a satisfactory ice cream.

* * *

Dear Sir:—Would you please send me a sample of the liquid used to determine whether or not the mix is sweet enough to be pasteurized without curdling? Also tell me where I can get some, and what to order.

J. F. C.

Reply: We are making up a one-half or one gallon of this alkali solution for you, and will ship it by express to-day. In using this solution you take a measure full of the alkali solution and mix it with an equal measure full of milk or cream to be tested. If the color of the mixture remains a light pink it will pass pasteurizing all right. If the color of the mixture turns white it is too sour to pasteurize. I suggest that you secure the alkaline tablets and all the necessary apparatus to make up the solution. The tablets may be ordered as Farington's Rapid Acidity test. I suggest that you get a box of 1,000 tablets, which will easily last you for several seasons. In making up the solution use two tablets to one ounce of water. This would mean 32 tablets to a pound of water. The water should be nice clean rain water or distilled water.

* * *

Dear Sir:—We increased our jeline 2 ounces on the 100-lb. mix and this helped us on our overrun, so we are having no trouble now. Also just received a scale so know what our machines are doing.

Is there any way to get away from using glucose?

When we did try to do without it cream appeared watery after freezing.

I am working entirely in mixing room, but soon hope to get in on the freezing end of the work, as I am anxious to become a first-class ice cream maker.

In taking a solids test of ice cream what condition is the cream to be in, a dark brownish color or nearly black? Also in making test for fat in ice cream at what temperature do you need your hot water bath, or is it best to shake bottle over alcohol lamp blaze? Will the fat separate entirely if heated over lamp before placing test in a Babcock tester? Also, in making a record of pasteurizing milk after temperature is recorded on a recording thermometer in heating, is it best to show a record of your cooling, with water down to 60 to 70 degrees before sending milk over cooling coils? It is required by the health department of Chicago to record cooling temperature as low as possible.

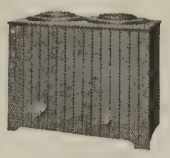
How many pounds of salt is required to hold 5 gallons of cream in good condition in shipping, provided it is in first-class shape when coming from storage room. Yours very truly, I. S. O.

Reply: There is absolutely nothing wrong with your mix, as it is up to the standard in all respects and you should have no trouble in making a satisfactory ice cream.

Regarding the use of glucose for part of your sweetener, there is absolutely no reason why you should continue its use. You are only supplying the equivalent of 18 lbs. of sugar which, in my opinion, will have no effect on the smoothness of your cream. You could easily substitute 18 lbs. of sugar for the 22 lbs. glucose in making the solids test for ice cream. The sample should be dried until it has a very light brown color and **not** until the sample is dark brown or nearly black.

I do not quite understand what you mean in your letter where you state you heat the test bottle over an alcohol lamp before placing in a Babcock tester. I should like to have you tell me just how you make this Babcock test and the kind of acid you use before giving you any advice.

Regarding the use of a record thermometer for indicating the temperature of pasteurizing and cooling of milk there is no law in this state which compels you to show the rapidity of cooling the milk on a chart. If you run your milk over the cooling coil after pasteurizing it is best to do this immediately after your milk is held instead of trying to cool it part way first and then running it over the coil. You not only save time this way but you also will get a better cream line on the milk and not as much of a cooked flavor.



Answering your inquiry regarding the amount of salt to mix with ice to hold a five gallon packer of ice cream in good condition, I may state that I can hardly give you correct information on this point because that will depend upon the hardness of the temperature of the cream when first shipped, and the distance to be shipped. Some ice cream factories do not use over two pounds of salt while others would use three or four. I suggest that you try this out yourself and see which will be most satisfactory.

* * *

Dear Sir: I want to use sweet butter, 4 per cent milk, 8 per cent Carnation cream in my mix. How much gelatine do you suggest to use? I have Purity powder on hand, do you think that I should use it or not?

I have no hardening room. I use an Emery Thompson 40 quart brine freezer, a 30 gallon Riley Hauk mixer. Can you tell me why a small manufacturer can't make

as good ice cream as the large manufacturer. I would like to have your formula for a strawberry ice cream.

L. E. P.

Reply: I am suggesting below in Table No. 1 and Table No. 2 two 100 pound ice cream mixes either of which wil make a satisfactory ice cream if handled correctly.

Table No. 1.

100 lbs. mix; 8 per cent fat, 31 per cent solids.

Ingredients	Fat	Serum Solids	Total Solids
14 lbs. sugar			13.30
1 lb. gelatine and flavor, 12 oz. Gel., 4 oz. flavor			.75
20 lbs. 8% evap. milk	1.6	3.60	5.20
5 lbs. 84% sweet butter	4.2		4.20
60 lbs. 4% milk	2.4	5.12	7.52
100 lbs.	8.2	8.72	30.97

Table No. 2.

100 lbs. mix; 10 per cent fat, 33 per cent solids.

Ingredients	Fat	Serum Solids	Total Solids
14 lbs. sugar			13.30
1 lb. gel. and flavor, 12 oz. Gel. and 4 oz. vanilla.			.75
20 lbs. 8% evap. milk	1.60	3.60	5.20
8 lbs. 84% sweet butter	6.72		6.72
57 lbs. 4% milk	2.28	4.90	7.18

You will notice that the mix in Table 1 contains only 31 per cent total solids while that in Table 2 contains 33 per cent. The mix as shown in Table No. 2 will make a better ice cream than that in Table No. 1 and will also make a higher overrun possible. In case you desire to do so you can substitute some of your Purity Powder for a part or all of the gelatine given in the formula. You must, however, use this powder according to directions and it takes a great deal more powder to have the same effect as a certain amount of gelatine.

To make strawberry ice cream or any other fruit ice cream you just use the same vanilla mix, except you would color the mix pink and add the fruit flavor and crushed fruit just before you draw the cream from the freezer or mix it using a wooden paddle or stirring rod, after you have drawn it from the freezer.

There is no reason why a small ice cream factory should not be able to produce as good ice cream as that made by the larger manufacturers.

* * *

Dear Sir:—We are having a little trouble with holding our chocolate ice cream smooth. It seems to get grainy or flakey so much quicker than the other cream.

Now, in preparing our chocolate, we are using three-fourths to one pound of cocoa and one pound of sugar to three and four pints of water. We put this in a double cooker and cook for about three-fourths to one hour until it forms a thick syrup. We then put this into the other mix when it is about one-half frozen.

Could you give us anything that would improve this any? We add enough heavy cream and milk powder to bring up the fat and solid contents according to what water and cocoa we are using.

Yours very respectfully, B. T. P.

Reply: I have your letter of recent date stating some trouble you are having in getting a smooth chocolate ice cream. I do not quite understand why you should get this, but suggest that you could eliminate this trouble by using a little more gelatine in your mix or a little improver of some kind. There is no technical reason why the chocolate syrup when added to the cream should cause it to become grainy or flakey, providing it is introduced into the ice cream at the right time.

Dear Sir:—I find in using 14 lbs. of milk powder in my 300 lb. mix that the cream is too pasty and they have trouble in keeping it hard at the fountain. It has a rubbery effect. Would you please analyze the following formula as I cannot have any success with the milk powder: 100 lbs. mix, 12 lbs. sugar, 1 lb. gelatine and flavor and color, 16 lbs. condensed skim milk (unsweetened), 30 lbs. 30 per cent cream, 42 lbs. 3½ per cent milk, 1 lb. milk powder.

I have tried this out and it makes a fine cream. I get the condensed milk from DeCoursey at Wichita, Kansas. They claim that it is 33 per cent solids (milk). I have no way of finding out, but the standard for the condensed milk is 25.5 is it not?

I want to make the formula 10½ per cent butterfat so I can add my fruit and nuts.

Respectfully yours, A. M. & CO.

Reply: I have analyzed your mix below in Table No. 1:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
12 lbs. sugar	...	.....	11.40
1 lb. gelatine and flavor	...	.....	.75
16 lbs. condensed	...	5.28	5.28
30 lbs. 30% cream	9.0	1.87	10.87
42 lbs. 3.5% milk	1.47	3.60	5.07
1 lb. milk powder	...	.95	.95
102 lbs. mix.	10.47	11.70	34.12
Per cents,	10.2	11.4	33.5

You state this was to be for 100-lb. mix but you will notice that it figures out 102 lbs. This will, of course, reduce the percent of butterfat to 10.2 per cent. If you desire to have your cream test 10.5 per cent it will be necessary to use about two pounds more cream which would mean, of course, that you would use the corresponding amount less of milk. You have plenty of serum solids so that you could even omit the one pound of milk powder and still have 20 per cent milk solids.

I might say regarding the composition of condensed milk that the solids will vary from 25 to 35 per cent, depending on the concentration. If De Coursey gave you 33 per cent as the solids in the skim condensed it is undoubtedly correct. The ordinary 8 per cent evaporated milk which you buy in gallon tin cans contains about 26 per cent total solids and 18 per cent serum solids.

* * *

Dear Sir:—I have made ice cream for 15 years and never have had the trouble that I have had for the last three months. My cream is good when it comes from the machine, but after it is a week old it gets sandy. I keep it well frozen so it don't get icy. For my small mix I put in 10 gallons of 23% cream, 10 gallons milk, 10 gallons bulk condensed, 40 lbs. sugar, 1 lb. gelatine, ½ lb. Velvet powder. This runs out 60 gallons, weighing 5 lbs. per gallon. A. W.

Reply: I have analyzed your mix as best I could from the data which you gave in your letter and you will find it given below in Table No. 1.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
10 gal. or 83 lbs. 23% crm.	19.09	5.69	24.78
10 gal. or 86 lbs. 4% milk	3.44	7.39	10.83
10 gal. or 90 lbs. bulk cond. skimmilk	...	24.30	24.30
40 lbs. sugar	...	.....	38.00
2 lbs. gelatine, filler & vanilla	.....	.....	1.50
301 lbs. mix.	22.53	37.38	99.41
Per cent	7.4	12.4	33.0

Per cent sugar, 13.3.

You stated that your ice cream became sandy after about a week's storage in your hardening room. This

An Unusual Service

Quality: Every one to whom we have shipped re-tinned and re-built cans, etc., come back with more business, stating we do exactly the kind of work they have always wanted.

Promptness: Customers tell us we make prompter shipments than any other concern—quick delivery is a special feature with us,

Dependability: You will experience, when having "MANITOWOC" on the job, a dependable re-tinning and re-building service that covers every detail, assuring you absolute satisfaction.

Satisfaction Guaranteed

Our guarantee to you is backed by the most modern re-tinning and re-building plant in the country—by the most expert workmen—careful selection of material and rigid inspection and by an organization of high standing with the Dairy Industry.

Redwood Qualities in Ice Cream Cabinets

Insulation—Rot Resistance—
Tight Joints—Good Looks
—Easy Woodworking—
Minimum Wood Waste.

NATURE gave Redwood its wonderful insulating properties—grown in layer on layer of tiny sap cells uniform in shape and size. In properly cured Redwood these sap cells become dead air pockets which resist the passage of heat and cold to a remarkable degree—making Redwood ideal material for ice cream cabinets and cold storage compartments.

Protected From Rot

Nature impregnates every fibre of Redwood with a preservative which protects against rot and decay from moisture, acids and salts. None of these natural enemies to most woods can quickly affect Redwood.

Redwood "Stays Put"

Equally important to the manufacturer and user of ice cream cabinets is the fact that properly cured Redwood is subject to a minimum of contraction and expansion—little shrinking, swelling or warping. It stays put—joints tight—no bulging or leaking.

Unusually free of knots, light in weight, with a close, even texture and true grain, Redwood is easy to work. It holds paint, varnish and stain well and can be given practically any finish desired. Most important—it keeps **cold in** and holds **heat out**—saves on ice and guards against ice cream becoming soft and unsalable.

sandy condition is caused by too large a quantity of bulk condensed skim milk. You will note that your formula analyzes 12.4% serum solids. I believe that if your serum solids are reduced by using less condensed milk you will not have the trouble with the sandy cream. I would suggest that you could very materially improve your formula by using more cream to increase the butterfat content to about 9 per cent and reduce the condensed so as to lower the serum solids to 11 per cent. This would still give you a total solids content of 33 per cent and I am sure would produce a much better ice cream.

* * *

Dear Sir:—We are starting up a new plant and have a viscolizer, batch mixer and cooler together with a cooler room and hardening room for ice cream. We have an ample supply of sweet skimmilk available. We wish to make as fine a grade of ice cream possible and want a formula giving us the necessary solids if possible without the use of milk powders. Expect to put out about a ten per cent butterfat cream, using gelatine and flavors.

I find many using "Impruv-Mix" and we have been using Meloine. If by using sweek skimmilk without milk powders, our cream is short of solids, we could add our per cent of butterfat. J. J. F.

Reply: I am suggesting for your information two 100-lb. mixes below in Tables No. 1 and No. 2.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
12 lbs. sugar	...	.....	11.40
1 lb. gelatine and flavor	...	.....	.75
87 lbs. cream and skimmilk	10.0	6.85	16.85
100 lbs. mix.	10.0	6.85	29.00

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
14 lbs. sugar	...	.....	13.30
1 lb. gelatine and flavor	...	.....	.75
85 lbs. cream and milk	12.0	6.50	18.50
100 lbs. mix.	12.0	6.50	32.55

You will notice that the first mix containing 12 per cent sugar and 10 per cent butterfat has a total solids content of only 29 per cent, and this mix would not, in my opinion, make a satisfactory ice cream unless additional milk solids in the form of skimmilk powder or condensed milk is used to bring the total solids to about 32.5 per cent. I am suggesting in Table No. 2 a formula increasing the percentage of sugar and butterfat. This formula will make a satisfactory ice cream without the additional milk solids, but I do not believe will be as good as a mix containing the extra solids.

* * *

Dear Sir:—I make cream in 50 lb. batches at a time, when made weigh 5 lbs. to the gallon. After it is made sometime it don't come up in the swell the way it should, or else it becomes mealy or sandy and I find butter sticking to my paddle. I get all my milk and cream from a creamery and they are very anxious to try and suit me so I thought perhaps you could suggest something for me to do to alter this. My formula is as follows: 3 gallons milk 4 or 4½ per cent, 1 gallon cream 40 per cent, 1 can of Van Camp's evaporated milk (8 lbs.), 6 lbs. of sugar, 4 ozs. gelatine, 90c to $1 pound, 4 ozs. of flavoring.

Audel's "Answers on Refrigeration"

A practical treatise for engineers. This book is the most complete work on the subject of refrigeration and ice making on the market today. 690 pages. Half leather binding.

Sent Prepaid on Receipt of $2.00.
OLSEN PUBLISHING CO.
210 Sycamore St. Milwaukee, Wis.

Reply: I have analyzed your mix and you will find the results given in Table No. 1:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
3 gal. or 25.8 lbs. 4% milk	1.03	2.21	3.24
1 gal. or 8.2 lbs. 40% cream	3.28	.45	3.73
8.0 lbs. evaporated milk	.64	1.44	2.08
6.0 lbs. sugar	...	.....	5.70
.25 lb. gelatine	...	.....	.24
.25 lb. flavor	...	.....	.03
Per cent	10.2	8.5	30.9
48.50	4.95	4.10	15.02

You will notice that the total solids of your mix are a little low, due to a low per cent of milk serum solids. In my opinion a good ice cream should have at least 20 per cent milk solids. You could very easily improve on your mix by adding a little skim milk powder. About 1½ lbs. of powder will bring the total weight of your mix up to 50 lbs. and would add the necessary milk solids.

The trouble you have had with the swell is undoubtedly due to the viscosity of your mix before freezing. I suggest that you could use a quarter of a pound more of gelatine and also that you hold your mix for at least twenty-four hours at a temperature of 40 to 45 degrees.

You also mention the fact that you have had trouble with the mix churning in the freezer. Whenever this occurs you cannot possibly get an overrun as the mix does not whip. You are probably introducing the mix into the freezer at too high a temperature, or are freezing too soon after pasteurizing.

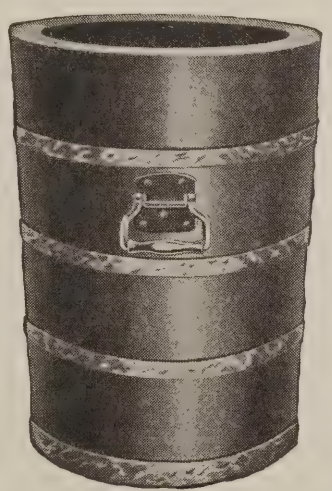
DOLLY MADISON'S NEW DESSERT.

By Fairfax Davis Downey in Milwaukee Journal.

Flanked by the silver's glistening array.
All on a field of snowy napery,
China with eagle crest and "U. S. A."
Bedecked the white house board in finery.
A dozen sat at table. Every guest
Was of a station notable in life.
A few the President with talk address'd;
The others, Dolly Madison, his wife.

Old negro butlers steaming viands bore:
Pick of Virginia's toothsome, tender hams,
Maryland's turkey from her goodly store,
Sweet Indian corn and luscious golden yams,
"Dishes American!" the hostess said,
A merry twinkle in her eyes.
Those who the pretty look a-right had read
Knew then the feast would hold a surprise.

Time for dessert arrived. Then came that pause
Which feel bon vivants when they're nigh replete.
A period when hunger no more gnaws,
But palates crave for something light and sweet.
What could it be, a pudding? Something hot?
Some crispy pastry by a French name styled?
'Twas in a frosted bowl—a heaping lot.
At looks of wonderment the hostess smiled.



Most curious, all plied their spoons in haste
The dish's coolness gave some headaches slight;
But then the lingering sweetness of its taste
Resolved each guest in praise of its delight.
Each gave fair Dolly an approving beam.
And pressed her with, "What do you call it, pray?"
So Dolly dubbed the novel dish "Ice Cream."
And that is what they call it to this day.

PRESSURE CONTROLS.

The nature of ice users business has forced the demand for refrigerating machinery. No up-to-date ice cream manufacturer can afford to be dependent upon natural ice as his cooling medium. The uncertainties of the crop, the difficulty of getting the proper temperatures when and where needed, and the uncleanliness of melting ice soon convinces far-seeing producers that they must rely on refrigerating plants installed under their own control.

This sound conviction led to the rapid demand for mechanical refrigeration. With this growth came new troubles for the ice cream man. The operating of ice making machinery at first presented some problems. Trained men were hard to find. Old time steam engineers did not take to the new gas readily—said it was too slippery, dangerous, and a pesky nuisance. Which objections in general recall the early complaints against automobiles, with their gas tank full of highly explosive juice. "What if she should burst?" asked the early automobile buyer. And you will remember that the daily press found much material for cartooning exploding "Fords". Now days the streets are black with automobiles and several million drivers sit right on top of the gas tanks and never worry about an explosion.

And so it is with ammonia and mechanical refrigeration. Old time engineers had to learn about the new line or get off the band wagon. When the installer first tried to pump him full of operating dope there was one point which stuck out clear and reasonable. The pressure gauges. They were old friends, and as the installer kept harping on watching these gauges it dawned on Mr. Engineer that here was the heart and pulse of his plant. In the open faces of his gauges he could always tell practically everything that was going on inside his maze of piping. So it came to pass that watching the pressure gauges became the ABC of ice machine operating.

But here a new problem popped up. Same old conscientious engineer had business all over the plant. Perhaps half a block away near the coal pile or three flights up on the roof under the condensers. It would have taken a spy-glass to keep his gauges in sight. There was nothing to do but trust in the Lord and do a dance back to the engine room every few minutes.

So things went on until a smart bird figured out a rig to do the watching for him. He was an experienced ice machine man. Knew the ins and outs of his plant like a book. He figured that a pressure control that would cut out his compressor motor or close a steam line when condensing pressure got too high would relieve him of most of his troubles. So the old timer designed and made the first ammonia pressure control. He installed it and from then on took life easy. Nothing could happen in his plant to annoy him. If the condensing water failed, bang! his compressor was shut down. If some fool meddler tried to start up with the discharge valve closed the same thing happened. If a slug of liquor got over into the cylinder at the first shot the compressor shut down.

So the old man sat pretty until his friends and neighbors came prowling around to find out why he never had any "stinks", or never blew any gaskets, and why he had to spend so little time tightening up and overhauling. When they learned the secret they set up a howl and wanted to be let in on the good thing.

That was twelve years ago. From the few pressure controls made up in a little shop as an accommodation for suffering friends a big business has grown. Today thousands of ice machine owners and operators trace their relief from troubles to the Monogram Excessive Ammonia Pressure control, hanging dusty and out of sight somewhere on their engine room walls. These controls are made by the Refrigerating Specialties Co., 625-No. 9 South Clinton St., Chicago, Ill., whose positive guarantee goes with every instrument. They will be glad to send their catalog No. 18-3 to anyone asking for it.

NEW ICE CREAM FACTORY BRANCH.

Completed plans for a modern ice cream factory branch at Long Beach, Calif., an undertaking which will involve an investment in excess of $20,000, were announced recently by the L. J. Christopher Company of Los Angeles. The property is improved with a brick building, just completed, having a total floor area of 4,000 square feet. The new owners will start immediately to complete and equip the building with a a thoroughly modern refrigerator system, having capacity in excess of 3,000 gallons of ice cream.

The plan of the Los Angeles firm is to make this a complete unit of their large plant in the city. Every necessity for handling ice cream, as well as a large storage capacity and efficient delivery system will be provided.

The acquisition of the property and installing of a modern plant reflects the steady growth of the L. J. Christopher Company, now in its thirty-third year. The officers of the company have expressed faith in the wonderful future and development of Long Beach.

Getting drunk to drown trouble is like stepping in the fire to cure chillblains.

NEWTON, IOWA

Refrigerating Specialties Co. July 19, 1921
Chicago, Ill.

Gentlemen:-

Your ice machine Pressure Circuit Breaker is alright.

It has kicked off three times already and at least once saved us from a bad accident.

The regular ice machine man was away last Sunday so the writer went down to run it. I have not been operating the machine for some time and somehow started it wrong. In just a second, before I had even left the machine room, the pressure had popped up to 250 and the Circuit Breaker slammed the current off and stopped the machine. It had gone up so fast, due to starting compressor wrong, that I had not glanced up at the gauges.

So I figure that if this Circuit Breaker was the only one obtainable it could not be bought for ten times what we paid for it.

Yours truly,

NEWTON PRODUCE CO.

THOMAS W. DUNN COMPANY

248 Front Street, New York

WORLD'S DAIRY CONGRESS ORGANIZATION.

In response to the call sent out by the chairman, H. E. Van Norman, of the organization committee for the World's Dairy Congress, some sixty subscribers met Wednesday, October 12th, and adopted a constitution for the organization which will have charge of the plans for the World's Dairy Congress. The name of the organization is to be the World's Dairy Congress Association, the governing body is a board of vice presidents made up of the president or other representatives of nineteen national dairy organizations and nineteen or more vice presidents at large. Nine vacancies on the board were left to be filled on nomination of the president after a more full canvass of the industry for members than has yet been possible. Details are referred to an executive committee to be nominated by the president and approved by the board of vice presidents and which will report to the board of vice presidents from time to time. Honorable Henry C. Wallace, secretary of agriculture, was elected honorary president of the World's Dairy Congress Association; H. E. Van Norman, University of California, was elected president; Robert Scoville, president of the American Guernsey Cattle Club, was elected senior vice president; C. W. Larson, chief of the U. S. Dairy Division, and B. H. Rawl, former chief of the U. S. Dairy Division, were elected honorary vice presidents.

Honorary president—Henry C. Wallace, secretary, Department of Agriculture, Washington, D. C.

President—H. E. Van Norman, president, National Dairy Association, University of California.

Honorary vice president—C. W. Larson, Chief, Dairy Division, U. S. Department of Agriculture, Washington, D. C.

Honorary vice president—B. H. Rawl, San Francisco, former chief, Dairy Division, U. S. Dept. Agriculture, Washington, D. C.

Senior vice president—Robert Scoville, president, American Guernsey Cattle Club.

In addition to the officers, a board of vice presidents, to have charge of the plans for the Congress, was elected, consisting of the following members at large:

Dr. D. V. McCollum, Johns Hopkins University; D. E. Austin, New York; Loton Horton, New York; John Le Feber, Milwaukee; Ed. Lewis, New York; H. J. Chisholme, New York; W. L. Cherry, Cedar Rapids, Ia.; J. A. Walker, Chicago; John A. Bell, Jr., Pittsburgh; C. E. Gray, San Francisco; nine additional to be named later.

The following presidents of national organizations, connected with dairying, were elected members of the board of vice presidents: Chas. Harding, American Butter Manufacturers; Robert Scoville, American Guernsey Cattle Club; Paul O. Reymann, Ayrshire Breeders' Association; Frank O. Lowden, Holstein-Friesian Association of America; M. D. Munn, American Jersey Cattle Club, National; Milo D. Campbell, National Milk Producers' Federation; E. M. Bailey, International Milk Dealers' Association; C. E. Morris, National Association of Ice Cream Manufacturers; W. C. Davis, National Creamery Machinery Manufacturers' Association; F. H. Harwood, National Creamery Supply Jobbers' Association; C. H. Eckles, American Dairy Science Association; N. P. Hull, National Dairy Union; C. L. Roadhouse, International Association D. & M. Inspectors; Wm. Hale, Brown Swiss Cattle Breeders' Association; H. E. Van Norman, National Dairy Association; M. Mortenson, National Creamery Buttermakers Association; W. M. Marple, Allied States Creameries Association; W. H. Lee, Certified Milk Producers' Association.

Permanent headquarters will be opened in Washington and plans immediately developed for the Congress, which will bring to this country eminent authorities in the problems of sciences relating to the industry, the production, manufacture, distribution of dairy products, the economics and influences affecting the world's markets for dairy products. Particular attention will be given to the growing interest manifested in many countries concerning the influence of dairy products in the diet and on the health of growing generations. The recent world war has directed the attention of nationally minded men and women to the problem of growing better men and women. Recent discoveries emphasize the importance of milk products as factors in the solution of the health problem.

THE BEST ICE CREAM PAPER.

We are in receipt of a letter from a Dixie Flyer, Mr. D. H. Gundrum of Philadelphia, Pa., in which he remarks about The Ice Cream Review in a manner which makes us feel proud to pass an excerpt of the contents on to our readers.

Philadelphia, Pa.

The Olsen Publishing Co.: Business is coming along nicely and things in general are looking better and we all look forward to a big year in the ice cream business.

You certainly have the best ice cream paper and you deserve a great deal of credit and have helped the game a great deal and I wish you further success.

(Signed) D. H. GUNDRUM.

The constant desire for a change which is implanted in every human breast is one of the most convincing arguments that there is an immortal part within, knocking at the doors of its prison house.

KAW VALLEY FRUIT PRODUCTS COMPANY
509-11 W. 5th STREET KANSAS CITY, MO.

Your favor of the 28th inst. just came to hand and note you are asking me to write you something about the coming conventions. With only thirty minutes left to catch my train for Buffalo to attend the Supply Men's Exhibition you must know that I have not time to go into this matter as I would like.

Will say briefly that I believe the stage is all set for a wonderful exhibition at Buffalo and Atlanta. The latter place in conjunction with the convention of the Southern Association of Ice Cream Manufacturers, and at which the Dixie Flyers will be on the firing line. Red Stewart and Peter Miller are working hard to put this over big and we know that spells success.

The other conventions following the Southern have been nicely arranged as to dates so as to have no conflict. This we have accomplished by co-operating with the various state officers.

I have been in recent touch with the Texas and Oklahoma officers and the usual big meeting is expected at both of these conventions.

Now as to Kansas, this will be pulled off in Kansas City, Baltimore Hotel, December 15th and 16th. I have recently held a meeting with the program committee of the ice cream manufacturers and also with the entertainment committee of the Jack Rabbits and everything is mapped out for a record breaking Kansas convention.

I am just in receipt of a letter from President Manley advising that the members so much approve the co-operation of the Jack Rabbits that they have set aside the first afternoon of their meeting for the Jack Rabbits. I would advise the Rabbits to be primed for a talk because many of them will be put through the third degree and expected to tell why is who.

I want every Jack Rabbit to be present at this meeting and those not present will be subject to a fine, unless a valid excuse is forthcoming.

J. L. NELSON, President.

HERE'S MORE "HUSH" COPY.

Is Glitch Passing Out I. O. U.'s?

The Ice Cream Review:

Your recent letter stated that a certain kind of "copy" was desired for your next issue in order to boost the coming state conventions. We do not know just what kind of "copy" you refer to, but if it should be that your readers want assurance of the value these meetings will be to them, I believe it would be demonstrated by the preparation most of the leading ice cream men are making in order to attend.

The writer just returned from a short trip in Oklahoma. Of course, down there the ice cream men do not have an opportunity to forget their state convention for the very simple reason that Clarence Hauk will not let them forget it. As soon as the 1920 meeting was over, he began talking for 1921. He does things besides talk, though—he works—and I do not hesitate to say that every detail of the next convention will be properly attended to. Further press agent work will no doubt be done by friend Clarence.

Now, as to the Texas convention: This needs absolutely no boosting. Every ice cream man in Texas will be there as usual. Every supply man who can possibly make an excuse to his sales manager for going will be there. This attitude seems to be sort of "permanent" with all of them. No sooner is one year's meeting over than they start arranging their route so as to come back a year later.

While I stated above that this convention needed no boosting, I'll let you in on a little "inside stuff" if you will not give me away. Ted Robinson, on a recent visit to Chicago, someway or other acquired the title to the city hall of that place. Now, everyone knows that Ted is busy enough with Mistletoe without running politics in Chicago, so it is reliably reported that he intends to dispose of his foreign interests and take over, for three days, the entire city of Ft. Worth, which, in my opinion, means that the ice cream and supply men can consider the place the same as their own during this period.

This is quite a sacrifice on the part of Mr. Robinson for it is a well known fact that the plot of ground occupied by the Chicago city hall is very valuable, and

DES MOINES PEOPLE EAT HUGE AMOUNT OF ICE CREAM.

Des Moines ate its way through an ice cream mountain, and then loosened its belt the first cool day in October for another gastronomic excavation.

The public appetite lapped up enough of the cloying sweet but succulent combination of sugar and milk to float a small battle ship.

Wholesale houses will not take time these post rush days to count gallons or add figures.

THIS ANSWERS — "DOES IT PAY?"

It is now open season for ice cream conventions, and we thank you for the nice little notice you have given our West Virginia meeting, on the 21st and 22nd of this month.

These metings do a great deal of good. First, for the benefit derived from meeting and talking with more experienced men in the business. Getting new ideas and absorbing enthusiasm.

Second, the meeting on congenial ground with competitors. It makes an opening for better understanding with one another.

Third, the displays of machinery and equipment, new inventions and methods are well worth the price of admission.

Fourth, the meeting with supply men on an equal basis brings about a spirit of co-operation that does a great deal of good besides making warm and influential friends.

To show you what our company thinks about conventions, we sent nine plant managers to Minneapolis, and propose to send several to Atlanta. Of course everybody in the state interested in the ice cream business will attend our own little state convention at Wheeling, to which we individually and jointly invite the trade from neighboring states.

I consider the wonderful growth of the ice cream business and the present high plane on which the busi-

"About 20,000 gallons within five months," one ventures.

"Much more than that," the wholesaler replies indifferently.

Even the federal tax collector cannot give figures.

"Figure on 50 cents for tax on each gallon and one can get the amount Uncle Sam received as his share," he advises.

Even Uncle Sam can not estimate without a handy adder just what the total amount of ice cream eaten in Des Moines this summer is.—Des Moines (Ia.) News.

⚜

DIXON HAS NO SMALL HOPES.

The Ice Cream Review:

Fayetteville, N. C., Oct. 31, 1921.

The officers of the North Carolina Ice Cream Manufacturers' Association will attend the convention in Atlanta November 28th to December 1st, and the writer has the promise of almost 100 per cent attendance of the rest of the members.

Owing to the limited number of southern representatives at the National Convention in Minneapolis, I feel safe in saying it will be the largest and the best attended convention ever held in the South.

YOU TELL 'EM, TEXAS, YOU'VE GOT THE BULL.

The Ice Cream Review, Milwaukee.

Gentlemen:—As the cool, bracing winds begin to reach us from up about your 'neck o the woods' it starts our thoughts to running in the general direction of SOME GOOD CONVENTION, and about this is just what I beg leave to tell you.

The fourteenth annual convention of Texas Ice Cream Manufacturers will positively SHOW at the TEXAS HOTEL at our Panther (not Badger) city Ft. Worth, December 7th, 8th and 9th.

Now if you know of anybody that has a good case of the DUMPS just advise said party to be on hand for this occasion and this bunch will absolutely have the cure to take care of the very worst cases.

The Texas is the very newest and possibly the best hotel in the state, and we are assured of ample and first-class quarters for all that may come.

We assure you of a very instructive and interesting program, and as to the entertainment features, it is needless to say that the Texas boys always DO that their own way, which is usually pronounced unanimously as THE VERY BEST.

The very best plants in the South can be found in Dallas and Ft. Worth. Come to see them. There will be plenty of time to inspect them all.

As president of the Texas Association I extend to all those interested in the ice cream game in any way to be with us at the above mentioned time and place. You will never regret the time and money spent, and we guarantee you will have memories (possibly marks too) that will stay with you for some time to come.

Trusting your good and instructive paper shall have its usual representative with us, I am,

Very truly yours,

FRANK B. WESTER, President.

* * *

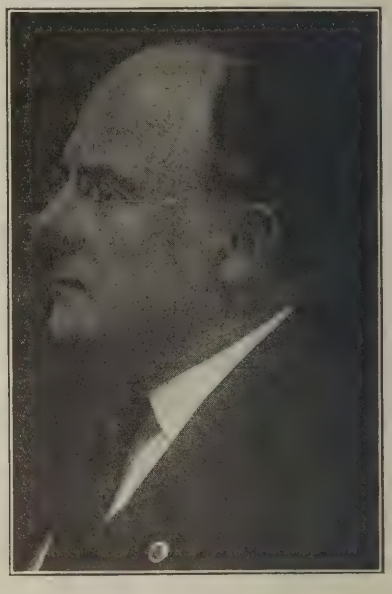
The Ice Cream Review:

As requested in your letter of Oct. 3, I mailed you my photograph. Just what you wanted it for was not explained in your letter. However, when it has served its purpose please return, so it may again continue in its function as an exterminator of all manner of little pests that usually inhabit the home.

Business has been "rotten" thank you, but the clouds are clearing away and we are looking forward to a bright future, as inquiries are coming in almost daily.

The whole plains country looks much better than it did a few months ago. The increase in the prices of cotton and oil have had a very stimulating effect and as soon as some of the great problems that are now confronting the country are definitely disposed of, we will get back into our old groove and everything will run along as before.

Fort Worth is particularly fortunate, as we now have a hotel, The Texas, that is second to none in the country, which will bring many conventions here that have passed us up in the past for lack of proper accommodations. The large packing houses, nine oil refineries, a $5,000,000 government Helium gas plant, grain elevators and the largest artificial reservoir in the country, covering 9000 acres, which insures an ample supply of water for years to come, for domestic and manufacturing purposes. Of course you have heard of our baseball team, pennant winners of last year, and both of this year's split season, also the Dixie championship of 1920 and 1921, surely we have many things to be thankful for.



We are looking forward to a large attendance of ice cream manufacturers, not forgetting the indispensible supply man, without him all conventions would be a dismal failure. The local contingent will

Mojonnier Ice Cream Packaging Machine
Patented December 17, 1918. Process and other patents pending.

Mojonnier

Ice Cream Packaging Machine

THE Mojonnier Ice Cream Packaging Machine is a LABOR SAVER. It has reduced the labor of packaging from twelve to seven operations; has reduced number of helpers from seven to three; has reduced hardenings from three to one. It eliminates pouring into molds, dipping, cutting, wrapping and exposure to heat and air after hardening, thereby improving quality and texture of the brick ice cream. It prevents loss of ice cream and does not reduce overrun. The hopper is jacketed containing brine coils and outside insulation. Cream has been held in hopper for four hours without change.
Now in successful operation in plants of Goodman-American Ice Cream Co., Hydrox Co. and Lawrence Ice Cream Co., Chicago. These three big firms pack their entire output of three layer bricks on the Mojonnier Ice Cream Packaging Machine.

Sold on either a liberal rental basis or outright sale.

Write for descriptive circular and prices.

Automatic Force feed Positive in action. Fills exact measured quantity in either quart or pint cartons; carry home pails or round cartons.

MILK BY THE YARD.

Terrell, Texas, Nov. 4, 1921.

The Ice Cream Review:

As per your second request, I am enclosing herewith my photo, and if you think it will not wreck your printing press go to it.

I have been at home for several weeks training a Junior Mack that arrived just in time to give his consent for me to go to the dairy show.

I have just made a hurried trip over a good portion of the state recently and, of course, made inquiries about who expected to attend the convention at Ft. Worth on Dec. 7, 8, 9, and am very much pleased to say to you that from what I can learn it will have a full attendance of the manufacturers and I hope the supply men will attend equally as well, and as a word of inducement for all the supply men to come I am giving them this "tip" in advance, "Some people down here are estimating the corn crop by the gallon instead of by the bushel.

I hope I may see you at the convention.

W. A. (Mack) MC FARLING.

* * *

Hats off, boys, to the youngest member of the McFarling family and Texas Supply Men. Dame Rumor says a baby boy was left at the home of Senator and Mrs. W. A. McFarling in Terrill, Texas, September 27th. Mother and son are doing well, and Mac is swelled up like a poisoned pup. They will have to make him president at the next meeting.

* * *

One of the Texas rangers to whom we sent our S. O. S. of October 1st took a fall out of the Texas manufacturers. He forgot to sign it.

It reminds us of Levinsky at the Jewish wedding. An Irishman was there and in some mysterious way a fight started. Levinsky, telling about it says, "I got hit with a tomato. It was a cowardly tomato. Do you know what a cowardly tomato is? No? One that hits you in the back of the neck and runs."

But here's his story:

I have lost my "Eversharp", in fact it is poor policy to call on the ice cream manufacturers of Texas with an expensive pencil. I have contributed to their office supplies all this season. Business is good but its over. Will see you at the convention in Fort Worth.

* * *

The local members of the Texas Supply Men's Association held a meeting this morning at the Texas Hotel, and arranged a program for entertaining all attending—members, and members of their families. We realize that our last meeting at Waco, set us a pace that will be hard to beat, but we still have a few aces up our sleeves, and you may rest assured we will not be found wanting.

W. A. McFARLING,
Meyer Dairy Equipment Co.,
Ex-President, Texas Supply Men.

W. L. CASTLE,
Blanke-Baer Extract & Preserving Co.—A Texas Supply Man.

FRED HOLLWEG,
Thos W. Dunn Co.,
A Texas Supply Man.

We want to impress on all supply men, as well as regular members of the Texas Association, that we expect them to bring their wives and daughters, for without them the convention would be a dismal failure. We will have ample housing facilities in our new $4,000,000 Texas Hotel, the best of its kind in the southwest.

We have many attractions in and around Ft. Worth and the key to the city will be yours on that occasion. The dinner dance in the Crystal Ball Room is one of the attractions and will be under the supervision of the Ladies' Auxiliary, who will bend every effort to conduct it on a high plane.

We might mention many other attractions which we have planned for your entertainment, but are keeping for a surprise. Rest assured, however, that "Southern hospitality" will not be found wanting, therefore please do not overlook the dates, Dec. 7 to 9, inclusive, and help us make this meeting as good or even better than our last. Sincerely yours,

G. F. BEIN,
President Texas Supply Men's Association.

Condensed Milk and Milk Powder

(BY OTTO F. HUNZIKER)

THE THIRD EDITION of This Book Has Just Come from the Press.

This work represents a new book from cover to cover. It contains the description of the latest equipment and of the most improved methods and practices in the manufacture of every marketable line of condensed and dried milk products.

The More Outstanding New Features Are:

New methods for cooling sweetened condensed milk to prevent grittiness and sugar sediment.

New methods for sterilizing evaporated milk to prevent formation of a permanent curd.

Viscosity tests.

Condensing and drying of buttermilk by commercially practical methods.

The use of the Ruff Condenser.

Description of 20 different processes of desiccating milk by the dough-drying principle, the film-drying principle, and the spray-drying principle.

Detailed discussion of the commercial manufacture of powdered milk.

Cost of manufacture, composition solubility, properties, defects and keeping quality of milk powders.

All other chapters have been revised so as to make available such information as will be of the greatest service in the successful manufacture and marketing of condensed and dried milk products under the new and changed conditions of the industry.

The price of this new and enlarged volume is $5.75 per copy.

TEXAS ICE CREAM MANUFACTURERS' ASSOCIATION.

Dallas, Texas, Nov. 5th, 1921.

The Ice Cream Review:

I have your favor of recent date regarding the Texas ice cream convention, which will be held in Ft. Worth, December 7th, 8th, 9th. Headquarters, Texas Hotel.

Last year the Waco boys pulled a wonderful show, and it is going to require some work of the Ft. Worth bunch to equal the Waco stunts. However, the boys in Cow Town are pretty foxy and are planning to hand out a different brand, but promise the kick will be just as pronounced.

The business sessions will be snappy and full of good things; things that every ice cream manufacturer should know. The entertainment commitee is going strong, and, while not putting out any information, I learn that they will not have "chickens," as at Waco, but probably "ducks;" however, they promise the "quack" will prove as pleasing as the "peep." Some of us have pleasing recollections of the Waco "peep" and don't know anything about ducks. But you know Ft. Worth.

The officers and directors are working hard to get every ice cream manufacturer in Texas to attend this convention, and we hope to make their visit both pleasant and profitable.

Very truly yours,

H. F. OWSLEY, Secretary.

NATIONAL ORDER OF WHITE CAPS

Address all communications to
W. W. WREN
Secretary
Fort Worth, Texas

The Ice Cream Review:

The writer is in receipt of your favor of October 28th, asking for information with reference to the meeting of the National Order of White Caps during the convention of the Texas Ice Cream Manufacturers' Association, which is to be held in Fort Worth on Dec. 7, 8 and 9, 1921.

The writer is extremely sorry that a great deal of information can not be given you on this subject. As you perhaps know, the activities of the National Order of White Caps are guarded with the greatest secrecy. In fact, there is nothing recorded that would enable one to get any information about this Order, as everything is communicated from mouth to ear.

I will say, however, that the voyage will be made on the evening of December 8th. The good ship UNFERMENTI will weigh her anchor at the auditorium of the Chamber of Commerce promptly at eight bells, p. m. Chief BUTTERFAT, the skipper, and his mates SKIMILKUS, O'SALTUS and AQUA DE CANINE will be on board, together with the chief steward, MINCE PIE A LA MODECUS, to receive all the members of the Order and make them welcome and also to take charge of all the land lubbers that dare to set their foot on the gang plank. It is advisable for all who have not taken this perilous voyage to see that a respectable insurance policy is taken out prior to the voyage, as the deck is entirely frozen over with ice and the sea is extremely rough.

The destiny of this good ship is a secret, but we hope to land all safe and sound in port not later than 3 a. m., on the morning of the 9th.

ICE CREAM AND CREAMERY COMPANIES TO CONSOLIDATE.

Frank D. Chase, Inc., engineers of Chicago, have been employed by the Bloomer Cold Storage Company, of Council Bluffs, Iowa, to analyze thoroughly their manufacturing processes and to make a new and improved layout of their equipment. This work will include the consolidation of the former Superior Ice Cream Company with the creamery of the Bloomer Company.

IMPORTANT WOLF HOUND REUNION.

A call issues forth from the lair of the Wolf Hounds den, for all brother Wolf Hounds to meet at convention with the ice cream men in Oklahoma City, Okla., Dec. 12, 13 and 14, 1921, at the Huckins Hotel, to discuss the many big problems that confront us; and prove to the world our claim that the Wolf Hounds are the spirit of good cheer, and the happy medium to greater things in royal true fellowship. Oh! what a great pleasure it is to be hailed by your fellow man with a smile and hand shake, that rings true as the greeting of the now famous Wolf Hounds extend to all; keep it up boys, it is great, oil your joints in your mighty right arms because you are going to be called upon in the coming convention, to greet the largest gathering of ice cream men that ever attended a state ice cream convention in the history of this great industry.

Reservations are pouring in for rooms and space to display. Fellows, this year's convention is going to be a Hum-Dinger. Hounds be on your mettle. It sure looks good; depression in this part of the country is over and forgotten. Watch Oklahoma step on the gas and lead the field in 1922; sharpen your pencils, boys (meaning lead pencils, of course,) and be here in Oklahoma City December 12th. As to the entertainment, well you know the caliber of this end of it, on the quiet boys (for men only) the girl in the glass dress will appear in private, at our dutch lunch. Ladies not admitted until after this act; of course, if Brother Porter, Ward, Solliday and Parker promise to behave they will be admitted, under guard of the strong arms of the Wolf Hounds' Kennel Keepers.

Awaiting your august presence and with greetings of good cheer to all, this Thanksgiving Day, we thank the Great Heavenly Father for the many, many blessings of this year. C. R. HAUK,

J. B. PORTER,
President, Oklahoma Ice Cream Manufacturers' Association.

J. M. MORRISSEY,
De Coursey Creamery Co.,
A Wolf Hound.

C. R. HAUK,
President of the Wolf Hounds.

OKLAHOMA ASSOCIATION OF ICE CREAM MANUFACTURERS.

Tulsa, Okla., Oct. 31, 1921.

The Ice Cream Review:

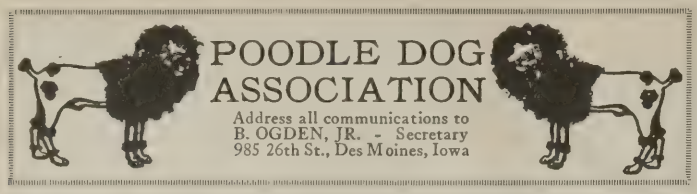
A thoroughly up-to-date program is being worked out for the Oklahoma Ice Cream Manufacturers Convention in December . The entertainment features, under direction of C. R. Hauk, president of the Wolf Hounds, and associate members, are well under way while Secretary Cochran is busy providing the best possible talent from an instructive standpoint and a full half day session has been set aside for discussion of practical questions.

Indications point to a full attendance of members and a number of manufacturers from neighboring states as well.

J. B. PORTER,
President.

MAIER DOESN'T BELIEVE IN SUBSTITUTES.

We asked J. J. Maier, a worthy Dixie Flyer, and member of the Knox & Maier Co. family of Atlanta, for his photo. Nothing doing. Boys, we are sorry J. J.'s picture isn't in this issue, but you will see the real article at the Atlanta Show. Knox & Maier will have a booth in the auditorium, in charge of their C. W. Bryan. Register at their booth and get a useful souvenir.



WHEN you find yourself muzzled for cash and caught with a lot of equipment no longer needed in your plant, try a little classified ad in our "Want Department." They seldom fail to bring results.

IT'S BIRDMAN OSTRUM NOW.

The Ice Cream Review:

Have your letter of October 29th and thank you for invitation to use your column for publication of association news. The dates for the Iowa convention have not been definitely fixed and all Poodle Dogs are anxiously awaiting notice of those dates so that they can plan to evade work at that time. If wives ever

keep boosters away from a convention, the Poodles are all stray dogs, because their attendance is unanimous at each Iowa state meeting. As soon as the convention dates are definitely fixed, we will all go to work with the idea of making the next Iowa state convention the most successful to date, which will be going some.

It occurred to me that many of your readers would be interested in reading of the trip made by the Morton Salt Company's flying boat which left Chicago on October 12th, and is expected to arrive in New Orleans some day this week. This boat visited all of the larger towns en route. We are quite sure that a number of readers saw this boat, and that a number of them made short trips as passengers. The following story is being used by newspapers in a number of larger towns between Chicago and New Orleans.

A. O. MC CUNE,
Secretary Poodle Dog Association.

* * *

Racing over the very waters which the south hopes to see as the course for great ships of tomorrow, the great blue flying boat of the Morton Salt Co., illustrated below, is on its way from Chicago to New Orleans at the present writing (Nov. 1st), in a flight that is to stimulate interest in the Lakes-to-the-Gulf waterway project, and demonstrate the possibilities of aircraft as aids to business.

On board are Lieut. Commander Ray P. Applegate, U. S. N. R. F., one of the few men in the United States holding a Mississippi river pilot's aerial license, and Poodle Dog C. L. Ostrom, of the Morton Salt Co.

It is their purpose to stop at more than 50 cities and villages lying on or near the Mississippi river between St. Louis and New Orleans, conferring with local business men and officials in an effort to strengthen trade relations between the south and north.

The vessel will land at several cities where the company has business connections and local wholesale dealers will be taken for a short spin, after which the craft will be thrown open for the public to inspect.

The flight of the plane down the Mississippi and Illinois river valleys marks the beginning of a new era of trade getting methods, this being the first time a flying boat has been utilized by a business concern for reinforcing the efforts of its varied salesmen.

The craft followed the course of the sanitary canal to Joliet, the Illinois and Michigan canal to La Salle, Ill., then down the Illinois river to the Mississippi and St. Louis.

It is not mere coincidence that the flying boat is taking the course it is. More than a decade ago, Joy Morton, believing that waterways were the solution of most merchants' and producers' shipping troubles, resurrected from the bottom of the Illinois and Mississippi rivers, a fleet of old boats, rebuilt them so they were entirely seaworthy, and began the shipment of salt from Chicago

G. B. TAYLOR,

to Mississippi river points. It was the first time through freight has ever been carried from Chicago to Davenport, Iowa, via the Hennepin canal. For three years this fleet was kept in operation purely as an experiment —long enough to prove that if the waterways were improved and deepened slightly, merchandise could be carried quickly and with both profit for the shipper and economy for the people.

Now the flying boat is traversing to the same waters, to remind people again, that if the railroads are to be prevented from charging excessive rates they must have competition in the form of natural waterways and canals.

WORTH $5.00 AN ISSUE.

We are in receipt of a letter from Henry Hoesly of Sheboygan, Wis., in which he so highly lauds THE ICE CREAM REVIEW that we feel we ought to let all our readers in on it. In fact, we feel mighty proud of the tribute paid the service which this Review gives to its readers.

The letter reads:

"Sheboygan, Wis.

Dear Sir:

Please find enclosed check for which I wish to renew my subscription to The Ice Cream Review for two years. I could not get pleasure out of the trade as an ice cream maker without this Review. Some editions at various times were singly worth $5.00, say nothing of the balance of editions which totally number 12 per year. If everyone took the Ice Cream Review, they would not be guessing at their work so much; it would mean better ice cream everywhere at all times.

Trusting I will continue to get The Ice Cream Review each month, I am

(Signed) HENRY HOESLY."

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

LARGE CONSUMERS MAKING CONTRACTS WITH REFINERS.

Arrangements for Season's Sugar Supply Made by Big Buyers who Abandon Open Market.

Reports from Facts About Sugar are that some of the refiners had started a campaign to make contracts with large consumers of refined sugar for the coming season were confirmed from various sources. The first reports of the kind were to the effect that the American was making such contracts, but since then it appears that other refiners have followed the same course.

Direct Arrangements Made.

Brokers having Chicago connections have found, it is said, that several of the largest buyers in that territory have been tied up with contracts and are virtually eliminated from the open market. In some instances it would appear that the contracts have been made directly between the refiner and the buyer, while in others the arrangement has been made through the agency of brokers.

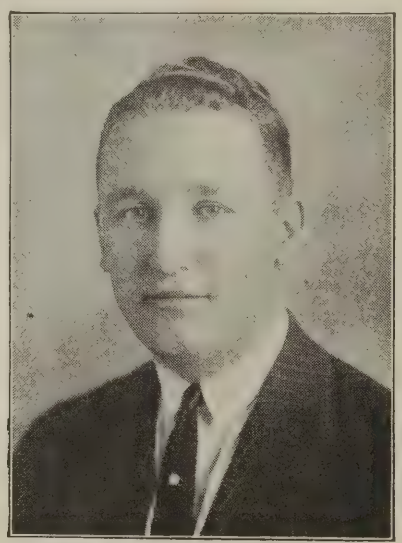
Most of the contracts are understood to provide for the jobber storing shipments from the refiner, for which he is allowed a fee of five points to cover warehousing and insurance. This, it is pointed out, is tantamount to the refiner allowing the jobber a rebate of five points, inasmuch as most of the jobbers who have entered into the arrangements have plenty of available storage space for the sugars and carry blanket insurance policies.

Terms of Contracts Vary.

The terms of the contracts vary in different instances, it is said, some making provision for cancellation with a specified time of notice and a minimum consumption on the part of the buyer, while others, believed to be the most numerous, are on the basis of a "gentleman's agreement" between the seller and the buyer. The buyer will be billed according to prices ruling the day of withdrawal from his warehouse, as is usual on consignment sugars.

Some of the eastern refiners are understood to look unfavorably on the system of selling sugar under these contracts and have refused to make any concession from their regular selling terms.

* * *



BRITISH MARKET FEATURED BY VIGOROUS COMPETITION.

Sugar Consumption Increasing but Declining Prices Restrict Orders from Distributing Trade.

London, Oct. 25.—Facts About Sugar says that the sugar distributors in the United Kingdom are pursuing a very cautious course. The general tendency of the market has naturally led them to restrict their operations and trade stocks are at a very low level. Competition is active in this market and British refiners have continued to cut their prices to meet quotations on American refined.

REFINED SUGAR MOVEMENT STALLED BY LACK OF RAWS.

Eastern Territory Mainly Affected—Resumption of Prompt Shipment Probable Soon.

The refined sugar market, according to Facts About Sugar was inactive recently for the reason that Atlantic seaboard refiners were unable to fill orders, owing to the exhaustion of their supplies of raws. As a consequence the trade has been marking time, awaiting the arrival of further shipments from Cuba which will enable the refineries to resume meltings on a normal scale.

Result of October Buying.

This situation is the direct result of a considerable expansion in the volume of orders placed by the distributing trade during the latter half of October, when refiners had allowed their stocks of raws to sink to an abnormally low level. Most of the refiners state that

they expect to be in a position to resume shipments on a normal scale immediately, but it is anticipated that not until the middle of the month will they catch up with orders in hand sufficiently to make possible the resumption of prompt shipments.

While substantial purchases of Cuban centrifugals were made by the refiners during the last week in October and at the end of the preceding week, and while the sugar finance committee has been endeavoring to expedite the movement of these sugars, heavy storms and delays incidental to the loading and moving of cargoes have prevented the arrival of a sufficient tonnage to relieve the situation.

Situation Considered Abnormal.

During the period of wartime control shortages were chronic in eastern territory at this season of the year due to lack of available raw supplies. The present situation is regarded as abnormal in view of the large stocks of sugar in Cuba, and is due directly to the fact

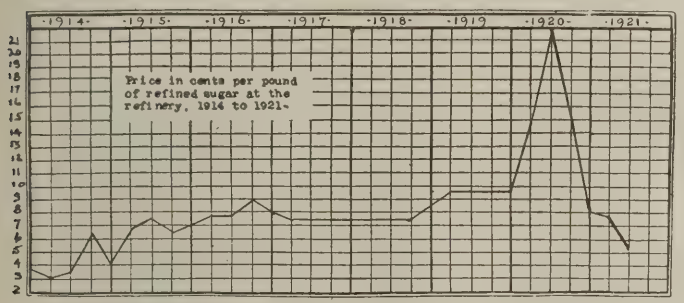

Plate. Courtesy of The Soda Fountain — Figures Furnished by Facts About Sugar

Sugar Price Fluctuations

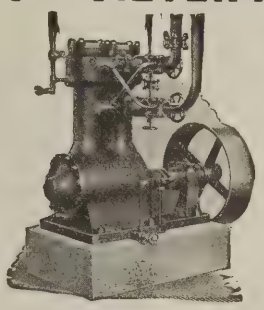
that trade stocks all along the line were allowed to decline to a point where they were inadequate to meet any acceleration in demand.

While refiners have been compelled to refuse orders, it is stated in trade circles that no particular hardship has been imposed on consumers by this fact, most distributors being able to take care of their trade thus far. The increased volume of business offered is attributed to a general disposition to take on slightly larger stocks, which was encouraged during the latter part of October by uneasiness over a possible interruption of transportation on November 1st. It is reported, however, that scarcely any of the orders have been withdrawn. They are being left in the hands of brokers to be filled as soon as possible, a condition which is regarded as assuring a fairly active business in refined throughout the month.

The interruption to the movement of refined has been limited largely to eastern territory. In the west and southwest sugar has been moving freely, as the Louisiana houses, the best sugar companies and the Pacific coast refiners have been shipping steadily. There has been very little transfer of orders, however, as the latter companies have been supplying central and western territory for some time, the distribution by Atlantic coast refiners having been confined to territory east of Chicago.

* * *

MR. SPRECKELS VIEWS THE SUGAR SITUATION.



C. A. Spreckels, president of the Federal Sugar Refining Company, has left for the Riviera on the Olympic and expects to remain away over the winter.

His views and opinions as the immediate outlook were voiced as follows:

"I am going to take a bird's eye view of the situation through the telescope. I want to see how it looks from outside and how they are going to get out of the scrape.

"There's no doubt they're in a scrape and the banks

are holding the bag. I don't know whether they're going to try to unload on the producer or the consumer, but they won't succeed either way.

"Any attempt to control the crop by artificial means is going to bring about worse smash than otherwise. The plan to defer grinding till February cannot succeed. The cane is there to make an even larger crop than last year, and as its content is higher in February and March than at any other time, delaying the grinding may even result in a heavier production than otherwise.

"We are in a very strong cash position, and if we see that artificial means are being used to control sugar we can afford to sit back and wait for the smash which is sure to come."

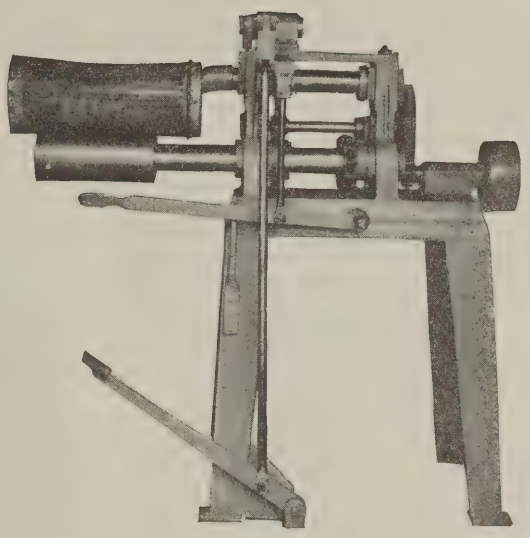
CUBA AND THE U. S. TARIFF.

In a communication to Facts About Sugar, arguing for a reduction in the duty on Cuban sugar, the editor remarks that "one very important and significant point is brought out. This is that the tariff it not added to the price paid by the United States buyer, but is deducted from the price received by the Cuban producer.

"This fact was clearly illustrated when the emergency tariff law went into effect at the end of last May, as we noted at the time. The last sale of duty-paying 96 degree test sugar made in the New York market before the new law went into effect and the first sale after it went into effect were made at exactly the same price, despite the advance of sixty cents a hundred that had taken place meanwhile in the cost of bringing Cuban sugar into the country. Within a few days the price went still lower than it had been before the change in duty, not, of course, because of the advance in the tariff rate but because of other factors that created a declining market.

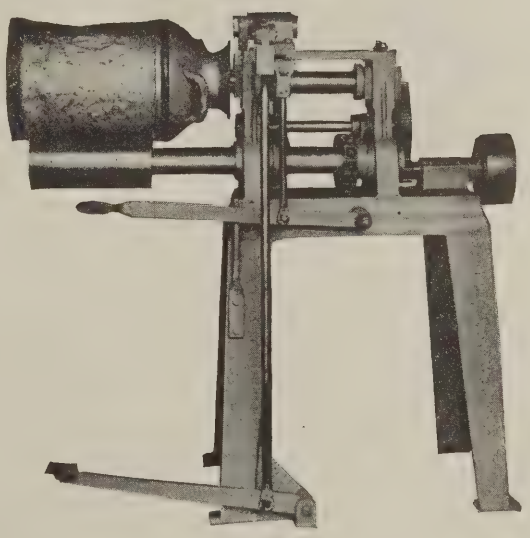


"As has been pointed out in studies of this subject which have been published from time to time, the incidence of the tariff depends entirely upon market conditions prevailing at any given time. The reason why Cuban producers were unable to increase the selling price of their sugar by the amount of the advance in the tariff rate last May, when the emergency law went into effect, was that the amount of sugar available to the United States market was more than it could take. In order to hold his position in the market, therefore, it was necessary for the Cuban to absorb the increase. Had the amount of Cuban sugar available been less than was needed to supply the requirements of this market and had there been no other foreign grown sugar competing for the market, the Cuban's price would have risen by the amount of the increase in duty, or by a substantial part thereof.

"The fact that Cuban producing interests are compelled to pay out of their own pockets the additional duty imposed by the emergency tariff law, which is estimated by the Cuban Commercial Mission to amount to $32,000,000 in the course of a year, raises the interesting question whether, under the conditions that are likely to prevail in the near future, Cuba will be able at any time to pass along the duty to the purchasers of her sugar. Now that Cuba's crop has increased to nearly 4,000,000 tons and is unlikely, except under official restrictions, to fall as low as 2,500,000 tons, it appears improbable that the Cuban producer will be able to add the duty to his selling price. With domestic production in the United States amounting to 2,000,000 tons and Cuban production at any figure in excess of 2,500,000 tons, it is obvious that with all this sugar seeking the United States market, which is capable of consuming a little over 4,000,000 tons, Cuba will not be able to shift the duty to the purchaser. Only an increase in the consuming power of the United States or a decrease in the available supply of sugar can change this condition.

"At the present moment the price commanded in the New York market by sugar grown within the United States is approximately 1.55 cents a pound higher than the price received by the Cuban producer, although the tariff paid by the Cuban sugar is 1.60 cents. To sell his product the domestic producer is compelled to yield a small part of his nominal protection. At times during the past few months the difference between the domestic price and Cuban parity has been much greater than this. Similarly, full-duty paying sugar has sold recently

"Wacho" Can Straightener



Convinces Many of its Practicability and Efficiency

SO CONVINCING was the demonstration of the WACHO Can Straightener at the National Dairy Show—so positively did it satisfy every one who saw it in operation, removing dents from bodies of cans and making necks and covers fit like new—so sure were no few old experienced men whose business depends on the handling of milk cans, that the working principle of the Wacho Can Straightener is right and actually completely straightens a can noiselessly in less than one minute, that these same big men in the industry who have tried the crude means of straightening cans heretofore available, have placed orders with us for these machines as quickly as we can get them to their factories.

Their names will be furnished on request.

If you were unable to see for yourself what a quick job the Wacho Can Straightener makes of removing dents in cans, how simple and safe it is to operate and how noiselessly it does its work, we want to tell you more about it or prove to you in your own plant its usefulness and practicability.

Write for circular and whether interested in a demonstration.

Just one trial order will convince and convert you.

SATISFACTION GUARANTEED

at a cost and freight price of 2.75 cents, against a cost and freight price for Cubas of 2.625 cents, the Cuban producer finding it necessary to yield all but twelve points of his forty-point preferential in order to find purchasers for his output.

"Not only is it impossible under conditions such as now exist for the seller of duty paying sugar to add the duty to his price, but it is equally impossible for the protected producer to obtain the full amount of his nominal protection. The United States producer finds it impossible to maintain his price at the full margin above the Cuban quotation nominally provided by the tariff law and the Cuban producer is compelled to yield the greater part of his nominal preference over full-duty paying sugars.

"Nevertheless the existence of these preferences is unquestionably helpful both to the native producer and to the Cuban producer in meeting outside competition. If the difference in the amount of duty paid measures accurately the difference in cost of production, all will compete on equal terms. If it is greater or less than the difference in cost of production, the favored interest will gradually increase its share in the total volume of sales. As a practical business problem, therefore, the fixing of a tariff becomes a question of adjusting the terms on which the various sugars available to a given market are allowed to compete. The exact determination of the rate which will make competition possible on unreasonably even terms can be reached only by definite information as to relative costs of production.

Believing that intelligent treatment of the tariff depends upon the full presentation of the facts and a right understanding of their application, we are glad to give space to views and arguments on all sides of the question."

* * *

FUTURES DELINE AGAIN.

Trading on the New York sugar exchange showed a further decline in raw sugar prices during the first week in November; there was no trading in refined sugar futures. The range of raw prices was as follows:

	High	Low	Latest
October	2.54	2.54	2.54
November	2.59	2.38	2.42
January	2.46	2.35	2.35
March	2.42	2.25	2.29
May	2.51	2.32	2.35
July	2.60	2.40	2.45
September	2.65	2.50	2.50

* * *

AGREE TO REDUCE RATES.

Eastern trunk line railroads are preparing to reduce freight rates on sugar from Atlantic seaboard points to Chicago and other competitive points in central territory. It is understood that the reductions were agreed upon at a conference held in New York between trunk line officials and representatives of a number of the eastern refiners.

The proposed changes, it is understood, will bring rates from seaboard points into central territory down to the level of rates from New Orleans, with exceptions as to certain points.

MORE LAWSUITS OVER PAYMENTS FOR HIGH PRICED SUGARS.

Suits to collect on 1920 contracts for the sale of sugar at 22.50 cents continue to be filed by the American Sugar Refining Company. The latest actions announced are against Cate & Woodward, of Providence, R. I., for the sum of $50,000, and against A. E. Brauns of Iron Mountain, Mich., formerly doing business under the name of Brauns & Van, for $21,000. The quantity of sugar involved in the last mentioned case is 340 barrels, it is stated.

* * *

A DISCUSSION ON INVISIBLE SUGAR SUPPLIES.

Editorilizing on the factor of invisible supplies, we find the following in Facts About Sugar:

"In discussions of the sugar situation a factor that looms large and comes in for much comment is the existence in Cuba of stocks at ports and interior points approximately a million tons above the average for this season of the year. A consideration of equal importance that is seldom mentioned is the entire absence of invisible supplies, not only in the United States but throughout the world. Such invisible supplies in the hands of distributors, speculators and consumers norm-

ally amount to 500,000 to 750,000 tons in the United States alone. For the world they probably average 1,500,000 to 2,000,000 tons.

"In the middle of 1920, when the long continued decline in the price of sugar set in, invisible stocks in the United States were probably at the highest point they ever had reached. Developments since that time have demonstrated that a great amount of hoarding by consumers had gone on during the period of war-time control and this was followed during the early months of last year by heavy accumulations of stocks on the part of distributors, operators seeking speculative profits, and manufacturers using sugar as a raw material for their products. The consequence, when the decline in prices set in, was that the ordinary channels of outlet were blocked and sugar backed up in the hands of producers.

"With the progress of time these invisible supplies have been gradually absorbed until they have entirely disappeared. They have not been replaced because neither dealer nor consumer has seen in prevailing conditions any compelling reason for carrying even his normal volume of supplies. Having experienced severe losses on his sugar purchases during the past year and a half and being thrown into more or less uncertainty regarding the probable future course of the market by conflicting statements as to controlling influences, the distributor has felt that his only safe course was to limit his stock to the requirements of day-to-day orders. The extent to which this practice has been carried is illustrated by a recent experience of the writer in visiting one of the principal distributing points of the country. He was informed that jobbers in that city were making it a practice to purchase only against orders actually received and were not carrying a single barrel of sugar over from one day to the next. Similarly, wholesalers and retailers were ordering only to meet actual requirements for a few days at a time. They preferred to take the risk of running entirely out of supplies rather than to take a possible loss through a further decline in prices.

"The significance of the depletion of invisible supplies under conditions such as now exist is that it paves the way for a rapid readjustment in the outward and visible state of the industry concerned. The assumption frequently made in connection with the sugar market that two to three years will be required to bring supply and demand back to a normal balance overlooks the bearing of this important factor. Considering the low state of supplies actually in trade channels throughout the world, it would be easily possible for the situation to be completely changed and accumulated stocks in producers' hands to be dispersed within a few months. In this particular instance it is probable that the change from present conditions will be retarded somewhat by Europe's difficulties in finding satisfactory means of payment and the consequent necessity that European countries will be under of continuing to limit their purchases to a volume much below their normal requirements.

On the other hand, it is possible that the situation may be cleared up much more quickly than even the most optimistic members of the industry now hope for. It is significant that the only part of the world in which a considerable oversupply exists is Cuba. In the analogous case of cotton, where the oversupply was confined to the United States, the developments of the past two months have shown an almost complete reversal of conditions. Should it become evident within the next three or four months that Cuba's coming crop is to be only two-thirds as large as that of the past season, this fact alone is likely to give the signal for an active buying

movement, directed to the reestablishment of normal stocks in distributors' hands, which would lift from the shoulders of producers in Cuba and the United States the burden of carrying the great bulk of supplies and would rapidly absorb these into customary trade channels.

"The exhaustion of trade stocks makes it reasonably certain that the movement of sugar during the remainder of the year will be heavier than is usually the case at this season. At what time a more comprehensive buying movement, leading to the replenishment of trade stocks will begin and what circumstances will set it in motion, however, it is impossible to predict with certainty. It is logically to be anticipated whenever buyers reach the conclusion that a change in the present apparent relation of demand and supply is impending, and the chances are that developments from now on will point in increasing number toward the realization of a marked change in this respect during the coming year."

viously used which were brought out during the trial of the cases.

Contracts Variously Interpreted.

The suggestion of a uniform refined contract appears first to have been advanced by E. L. Wemple, of the Warner refinery, but until recently did not seem to meet with much response on the part of other refiners.

In the meanwhile, however, the refiners have learned at their expense that the jurisdiction of various states differ and that while their former contracts were upheld in some sections, in others the courts took an entirely different view of the situation and permitted the buyers to break their agreements on one ground or another.

Mr. Wemple's suggestion has recently been receiving more earnest consideration, it is understood, and it is known that in some quarters the revision of the contract, at least, if not the adoption of a uniform document, is being seriously considered.

Creamery Package Exhibit at the National Dairy Show.

STANDARD SUGAR CONTRACT FORM CONSIDERED BY REFINERS.

Facts About Sugar Explain Adoption of Uniform Document may Result from Court Rulings in Actions Involving Validity of Sales.

As a result of the legal fights that were made by buyers in various sections of the country against the fulfilment of their alleged contracts for sugar at the high prices which prevailed during the middle of last year it is quite possible that a standard form of refinery contract may be adopted by all refiners in the near future, this contract being devised with the idea of eliminating weaknesses in the forms of contract pre-

The Buyer's Signature.

Some refiners in the past have been in the habit of accepting orders on the signature of the brokers, without troubling to obtain the signatures of the buyers, and while in some states the courts have held that the signature of the broker was binding, in others they have held the opposite.

While, of course, it would not be practicable for refiners to obtain signatures before shipment was made in cases where immediate shipment was requested, it does not appear that there is so much danger of violation of contract under these circumstances. On orders for delayed shipment, however, it appears possible that refiners will hereafter insist on the buyer's signature.

Another point that seems to have been open to more than one construction was that relative to the usual definition of shipping terms.

"Immediate delivery," the trade usually understands to mean shipment within three days, whereas "Prompt delivery" would call for shipment within ten days, and so forth. These shipping terms, however, met with varying constructions in different courts, with the result that in some instances refiners found the law would not accept the usual trade construction of the terms and held that the seller had defaulted in his contract.

The proposed contract would include a paragraph which would make more specific the shipping conditions. It is possible also that some clause might be inserted to cover possible market fluctuations between the time of order and the time of shipment. In the past buyers have often called on refiners to allow for market fluctuations while their sugar may have been in transit and these have repeatedly been allowed, although the buyer was not strictly entitled to call upon the refiner to take the loss entailed by a market decline.

⚜

BETTER LATE THAN NEVER.

Not so with Jim Mulligan. He's always there on time. In fact he sometimes sends in his "bit" so early that we get it into print a month ahead of time. Here's Jim's December contribution:

Am now on my way to meet all the Dixie Flyers at Atlanta, Ga., Nov. 28th, where we will have a grand and glorious time. Flapping our wings, which occurs once a year. And there old father eagle will be delighted to meet all the old Flyers and then to welcome the new ones, to the eagle nest for their protection in future and our hearty co-operation as in the past. It's very gratifying to see the good that has been done in the past year and the hearty co-operation with the ice cream manufacturers over the southwest and elsewhere in the United States. Still we must not lose sight of the fact of the valuable assistance and hearty co-operation of our National Secretary, Robert Everett, and the National Salesman Supply Association and all the manufacturers whose travelling men should join the National Association of Ice Cream Supply Men—as well as Dixie Flyers. Its to be hoped that all the Flyers will bring their wives (or sweethearts) with them to Atlanta, as we need all the ladies we can get, for it takes away that stag feeling and brightens up things quite a bit.

I find trade conditions steady, and outlook for next year is good, and all the ice cream manufacturers are pretty optimistic.

While in New Orleans I had the unexpected pleasure of meeting our old friend, Harry A. Benners, who is back in the salt game and is southern salesmanager for Jefferson Salt Co., Jefferson Island, La. Harry took me over to his office in the United Fruit Company building, on St. Charles St., near the St. Charles Hotel, and he asked about a number of the old boys that now belong to the Dixie Flyers. He will soon be one of the new eagles, as he will be with us at Atlanta. Mr. Benners has associated with him in the operation of the mines two of Louisiana, Ky., most staunch and wealthy business men, Mr. Lawrence Jones, of Jones Brothers, and Mr. Lysle Bayless, of Bayless Bros. Co., both firms of Louisville, Ky., and while operating but a short time, they report a nice satisfactory business. They also have associated with them M. S. Fiske, who will take charge of the Atlanta office in a short time.

The Significance of the "B"

The Bee has long been known for its energy and constant industry. So has B. Riley Hauk, our president, who has had forty years' experience in the Creamery, Dairy and Ice Cream Makers' machinery and supply line. Mr. Hauk still has the same old pep, and is anxious to serve you by giving you the benefit of his experience in our line.
The "Bee" in our trade mark is also significant of the letter "B" in Mr. Hauk's name to distinguish it from any other company, as he is solely connected with and interested in the
Dairymen's Mfg. and Supply Co.
403 NORTH MAIN ST.
Saint Louis, Mo.
B. RILEY HAUK, President

I had the pleasure of meeting him and judged him to be a nice clean hustling business man, and was well liked by the ice cream manufacturers of the South. So let's wish them success.

While this may not be printed until after Thanksgiving Day, I hope it will be happy for all, but am inclined to think that our turkey will be a chicken. However, let's all be thankful that we are to be together once more.

J. W. MULLIGAN.

SALESMEN'S CLUB MEETING.

At its annual business meeting in Buffalo, preceding the Eastern Exhibition, the Salesmen's Club elected the following directors for the ensuing year: R. J. Decy, J. E. Graham, W. E. Gray, Jr., G. R. Kleinau, S. W. Mendelsen, P. N. Miller, J. B. Morse, A. A. Senor and Thos. J. Stewart. Meeting later in the week this new Board of Directors elected the following officers: Thos. J. Stewart, president; W. E. Gray, vice-president; A. A. Senor, treasurer.

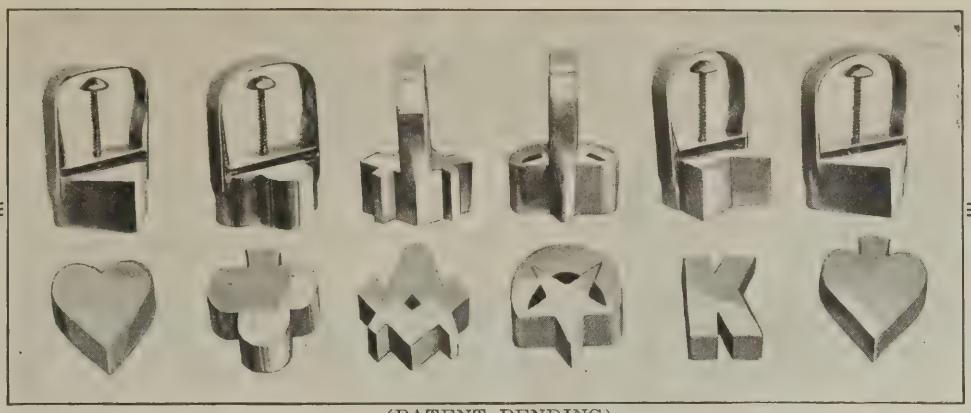
It is impossible to transfer to paper any expression of the enthusiasm shown at these meetings. They developed into real get-together, do-things-for-each-other-and-the-other-fellow affairs.

Club members swapped ideas on how to get more business. They discussed to just what lengths salesmen can and should help their customers develop bigger businesses. They told each other their experiences in helping the Club and the Association expand the ice cream industry.

You will receive a report of these meetings in detail soon. Meantime, if you were not at Buffalo and happen to meet up with any member who was, get him to tell you about the standing that the Club has gained.

STATE ASSOCIATION TO WIN PRIZE.

The state having the largest attendance of ice cream manufacturers during the first three days of the Atlanta exhibition is to be honored in a unique way. The state association will receive a loving cup presented by Mr. Geo. White, president of the White Dairy Products Company, Raleigh, N. C. Mr. White is also president of the North Carolina Association of Ice Cream Manufacturers.



NATIONAL DAIRY COUNCIL MEETING.

Notice is hereby given that the Annual Meeting of the National Dairy Council will be held at the Auditorium Hotel, in Chicago, Tuesday, the first day of December, 1921, at 10 o'clock in the forenoon. Matters of vital importance to the dairy industry will come before this meeting. All members of the National Dairy Council are earnestly requested to be present at this meeting.

NATIONAL DAIRY COUNCIL,
M. D. MUNN, President.
M. O. MAUGHAN, Secretary.

Don't Delay

THE KANSAS ASSOCIATION OF ICE CREAM MANUFACTURERS' SIXTH ANNUAL CONVENTION.

By B. T. Perkins, Secretary-Treasurer Pittsburg, Kan.

The sixth annual convention of the Kansas Association of Ice Cream Manufacturers will be held at Hotel Baltimore, Kansas City, Missouri, Dec. 15 and 16.

BERT PERKINS

While the program is not yet completed and ready to publish, the committee gives the assurance that every effort is being made to secure speakers with messages of vital interest to all Kansas and Missouri manufacturers, in their problems and difficulties. In arranging the speakers, they are being informed of the minimum and maximum manufacture of the members and are asked to confine their address to this capacity.

Mr. Loewenstein, secretary of the National Association, has promised to be present and tell what the National Association has been doing in the interest of the industry at large and for the several state associations.

The report of the proceedings of the National Association at Minneapolis will be given.

Prof. A. C. Baer, of Stillwater, Okla., is expected to have a part on the program. Those who have heard him once, will want to hear him again.

The Jack Rabbits have been given one-half day and one evening on the program. Those who have experienced the conduct of these animals at past conventions, will realize their ability to entertain. In arranging the program and also in past conventions, they have insisted on having more time. We are sure that they have some secret which they will spring, or rather a jack-in-the-box surprise. They assure us that whatever their entertainment is, it will be worth the time and expense. Let's show these fellows that we can stand all of their fun that they are able to corral and turn loose, as we realize that any person with the ability to put up the sale-talk that those fellows torture us with 12 months of each year, can surely put one-half day and one evening's fun and entertainment as a soothing balm for what we have suffered the past twelve months.

Those who fail to be present and get their share, will loose to that extent.

An invitation is extended to all manufacturers of ice cream, whether or not members of our association. Come and be our guests, and before you go away you will be a member and one of us, also to all manufacturers out of the state, as none are barred, but we welcome you and we will be pleased to have you as our guests.

A complete program will be sent to all members as quickly as printed, and the secretary will be glad to send same to anyone requesting it.

CALIFORNIA AND SOUTHWESTERN STATES ICE CREAM MANUFACTURERS' ASSOCIATION.

Our Annual Convention will be held at the Hotel Stockton, Stockton, California, December 5 and 6.

During the week of December 5 to 10, inclusive, there will be held a Pacific Slope Dairy Products Show in the Armory Building at Stockton; also during this week, the five dairy and creamery organizations of the state will hold separate conventions:

Monday and Tuesday, Dec. 5 and 6, California and Southwestern States Ice Cream Manufacturers Association.

Wednesday, Dec. 7, California Milk Dealers' Association.

Thursday, Dec. 8, California Dairy Council.

Friday and Saturday, Dec. 9-10, California Creamery Operators and Butter, Cheese & Ice Cream Makers.

CALIFORNIA AND SOUTHWESTERN STATES ICE CREAM MANUFACTURERS ASS'N,
Robert J. Dryden, Sec'y-Treasurer.

TEXAS BARREL COMPANY EXHIBIT.

The likeness below is that of Jacob Noodleman, president of the Texas Barrel Company. Eight years ago, at Houston, Tex., in conjunction with Joe Becker, Mr. Noodleman laid the beginning of the present plant. They continued plodding faithfully for five years and then decided to extend their manufactures to a more extensive field. They then began the manufacture of ice cream packing tubs. This addition soon placed his business upon a prominent basis, and he has now a well known and well established firm, manufacturing ice cream packing tubs as a specialty, and barrels and kegs for all purposes, and is running, in conjunction, a repair shop.

JACOB NOODLEMAN

Mention The Ice Cream Review

A. J. MILLER ENTERTAINS.

While on our way back from the Buffalo show, we accepted a very kind invitation from A. J. Miller, of the Sanitary Tinning Company, Cleveland, Ohio, to stop over for a day's visit.

In the morning we visited the plant out at 3753-63 East 93rd street. The different processes of re-tinning were fully explained to us and the trip proved very interesting. In fact, the was those old, rusty milk and ice cream cans looked after going through the re-tinning process put us in mind of the way the fairy made Cinderella look after using the magic wand. There was just one thing at the plant that we did not inspect

Yunker Makes His Famous Play.

fully, and that was "Mike" the watchman, and Mike os evidently afraid of the fair sex, for he skidooed when we made our appearance, but then, he may have been sleeping, for we thought we saw him hurriedly putting the finishing touches to his "toilette" as he risappeared through the doorway.

We did full justice to the wonderful chicken dinner and then boarded A. J.'s private sight-seeing car and took in the sights of Cleveland. We thought it a beautiful city.

In the evening, visitors arrived in the personages of David Gundrum, of the Keiner Williams Stamping Company, Richmond Hill, N. Y., C. J. Yunker, of Toledo, Ohio, who represents the Rex Extract Co., and R. E. MacFarland, Chicago, Ill. the "big boy" who represents Essex Gelatine Company. We adjourned to the billiard room where most of us played and some of us tried to, only to find out that no one need ever expect to surpass Mr. Yunker at that pastime, for he's so good at that game that he lets the bridge accompany the cue in chasing the ball to its pocket home in the corner. Oh! You Michigan Dairy Boosters, if you had seen that play, you would have paid real money for the sight.

We left at midnight, with the memory of a very pleasant day spent through the hospitality of Mr. and Mrs. Miller and daughters, Betty and Louise, and we hope some time to visit their home on the lake where we expect to pass a certain inspection before being admitted and where A. J. has iron rings set in a cement wall for a reason no one could eer guess.

THE EDITOR'S SIDEKICK.

OKLAHOMA ASSOCIATION OF ICE CREAM MANUFACTURERS.

Don't forget that the annual meeting of the Oklahoma Association of Ice Cream Manufacturers will be held at Oklahoma City, Okla., with headquarters at the Lee-Huckins Hotel, Dec. 12, 13 and 14, 1921. We have also heard that the Wolf Hounds are going to try to hold some kind of a meeting on the same date and place. For fear that they would try to take this advantage of us, have mailed notices to all ice cream manufacturers, calling their attention to this fact and urging their presence. From replies received it looks now like we are going to have a record crowd of ice cream men, and the Hounds will have to go some if they capture this bunch.

The program will contain many items of great importance to all ice cream men, and the success of the convention will be just what we make it.

"He profits most who serves the best."

We welcome anyone interested in the ice cream industry to meet with us.

J. B. PORTER, President. M. T. COCHRAN, Secretary.

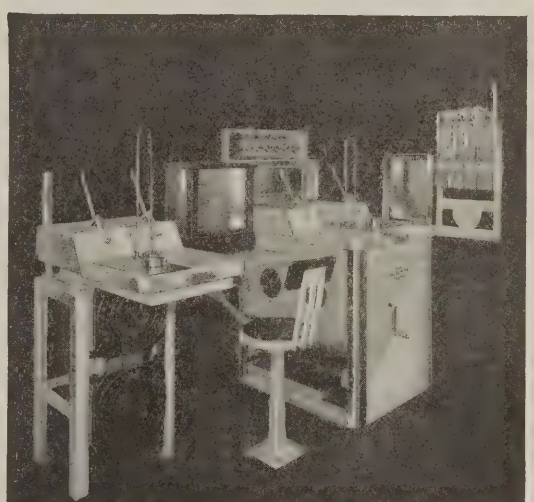
SPECIAL BULLETIN NO. 17.

The North Carolina Ice Cream Manufacturers' Association.

It has been reported that the express companies have inaugurated the increased estimated weights on ice cream shipments. The special instances which have been called to the attention of the writer are Smithfield, N. C., and Raleigh, where the new rates went into effect October 10th.

The express companies have issued these rates without the consent of the North Carolina Corporation Commission, and Mr. Womble, the Rate Clerk of the Commission, states that no increase has been granted, and he has notified the local express agents to cease billing the increased weights, and has so notified the superintendents.



This bulletin is issued to request the members to see that these rates are not put into effect at their stations until the matter has been decided and proper notice of the allowance of the increase has been given by the North Carolina Corporation Commission, of which action, if there should be any, your secretary will be promptly notified and will in turn advise you.

In the meantime data is being collected on this matter, and if any member has any information bearing on this subject, kindly forward same to your secretary at once. This is a very important matter, and is not to be neglected. Thanking you for your usual co-operation, I am,

A. E. DIXON,
Secretary.

N. B.—Do not fail to remember the dates covering the convention in Atlanta, where we hope the N. C. Ice Cream Manufacturers Association will play the stellar role.

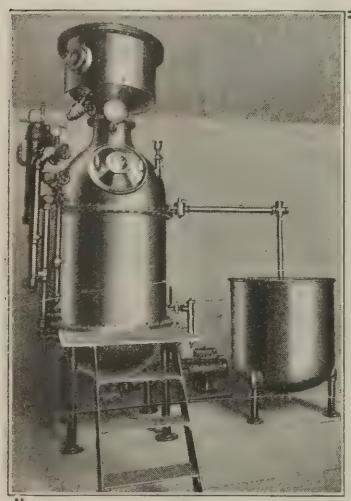
THEY DO THINGS UP RIGHT IN ERIE.

Frankie Biers, of the Erie County Milk Association, and the rest of the entertainment committee at the 15th Annual Convention of the Association of Ice Cream Manufacturers of Pennsylvania, held October 31st and November 1st, at Erie, Pennsylvania, in the Lawrence Hotel, certainly did things up "brown" in the way of royally entertaining the guests and making things generally pleasant for everybody.

The convention was very well attended and was a huge success. The program opened at 9:30 a. m., Monday, October '1st, by registration. At 1:30 p. m. the Address of Welcome was given by Hon. Miles B. Kitts, Mayor of Erie. The Response was made by Hon. S. S. Robertson, counsel for the Association. Then followed the President's Address by Robert Crane, Philadelphia, Pa. The reports of the secretary, treasurer, directors and committees were ably given in turn. "Difficulties in Enforcing the Pennsylvania Ice Cream Law" was well handled by Hon. Jas. Foust, Director of Bureau of Foods for the State of Pennsylvania. W. J. Stern, secretary Wholesale Credti Mens' Association of Erie, delivered an address. Open discussions were held on "Selling Indiscriminately—Is It Profitable?" 'Who Ain't Got Sand?" "Unfair Practices in Securing Business," and "Are We Striving for Gallonage at Expense of Profits?" Then followed an invitation to the Eastern Exhibit which was held in Buffalo, N. Y., October 31st to November 5th, given by O. S. Jordon, president of the Association of Ice Cream Supply Men.

On Monday afternoon a tea was held for visiting ladies. On Monday evening a hallowe'en banquet was given; the large hall was filled to capacity. After the banquet, the hall was cleared and dancing held full sway until the wee small hours of the morning. We'll say this for the ice cream supply men and the manufacturers, they certainly can dance—from the oldest down to the youngest—but the funny part of it is that the older they are the better they seem to dance, which goes to prove that the fellows are all live wires. "Pop" Crane was there and was being muchly entertained by the ladies in attendance, in fact, well, we don't like to tell on anyone, but we saw three ladies in one corner and upon closer observance we also saw "Pop" buried there in a big easy chair. Frankie Biers could easily be found, for his genial laugh, which is so well known to many, rang out in all corners of the room. And Davie Gundrum, of the Keiner Williams Stamping Company, Richmond Hill, N. Y., was presented to the crowd and entertained them so enchantingly with his famous "Grasshopper" dance that we were afraid that we would have to take Messrs. Walker, Slater, Jordan and the rest of the avoirdupois to the doctor for side-stitches. And we are still wondering if that party ever found his hat, which he misplaced. Taken all in all, the banquet and dance was a rousing success, and the following deserve a lot of credit:



"Dance of David."

Entertainment Committee—R. H. Arbuckle, D. E. Wiseman, F. G. Biers, of Erie County Milk Association; L. W. Mathias, W. W. Dart, of Lake Shore Ice Cream Company; S. Gordon, of Erie Pure Milk Company, and P. Pulakos, of Geo. Pulakos & Sons.

Tuesday's program began at 9:30 a. m. by a discussion by Wm. White, of Grove City, Pa., on "Possibilities of Building Milk Supply in Small Dairying Community," followed by topics given by Thos. Hall, of Harrisburg, Pa., Wm. D. McCormick, of Pittsburgh, Pa., and an address by J. L. Shoemacher, of Philadelphia, Pa. Some open discussions were held and the convention ended with all attending voting it a great success. Practically the whole crowd left for Buffalo, N. Y., for the Eastern Convention of Ice Cream Supply Men. A vote of thanks is also extended to to W. A. Cochran, manager of the Lawrence Hotel, for the many courtesies extended the visitors, and when another convention is held in Erie at the Lawrence Hotel, they will all be there.

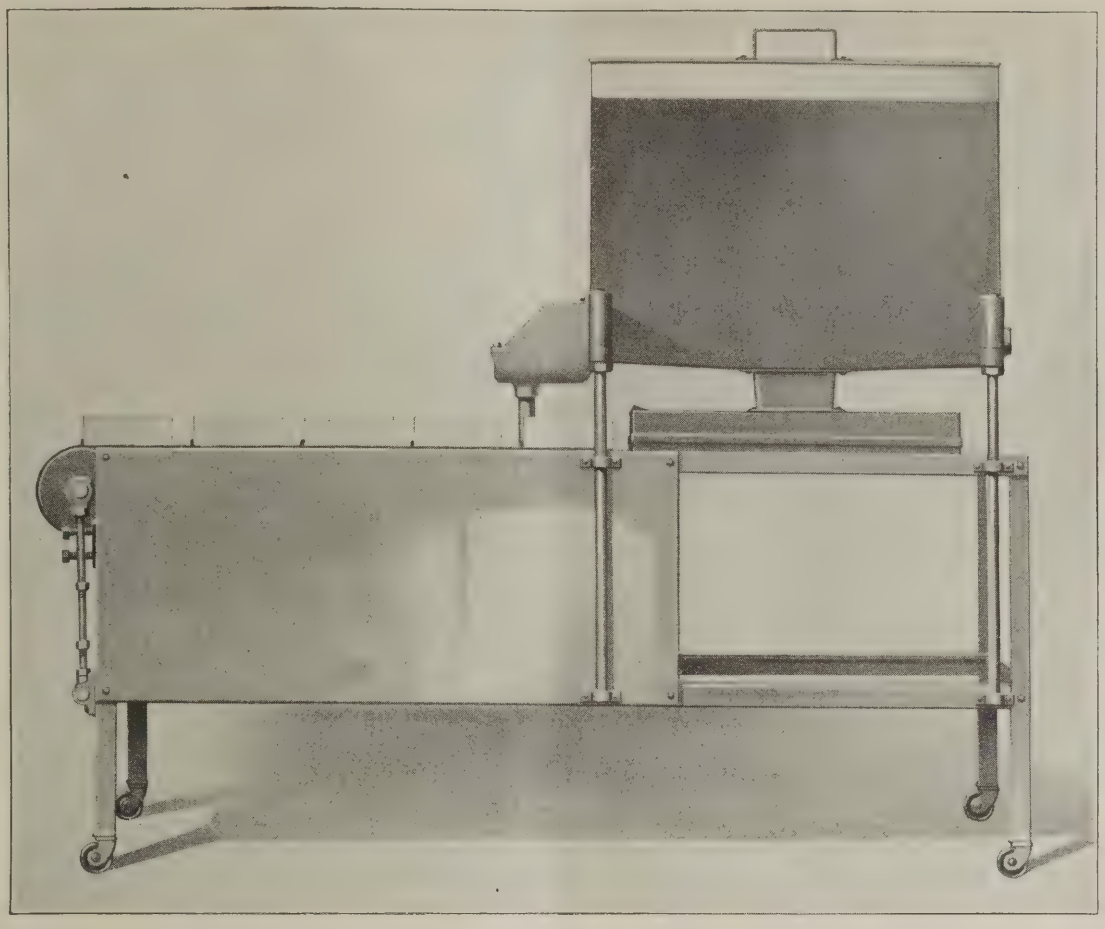
THE ASSOCIATION OF ICE CREAM MANUFACTURERS OF NEW YORK STATE.



Syracuse, N. Y., Nov. 5, 1921.

The Ice Cream Review:

The 14th annual convention of the Association of Ice Cream Manufacturers of the State of New York will be held at the Arlington Hotel, Binghamton, N. Y., November 30th and December 1st.

A very interesting program is being arranged covering subjects which have been suggested by our members in various parts of the state. The ice cream manufacturers of Binghamton are making arrangements for the convenience and pleasure of our members and their wives, and our officers have every reason to believe that this will be one of the best conventions ever held by our state association. A cordial invitation to attend is hereby extended to members of the ice cream associations of other states.

A. M. LE MESSURIER,
Secretary.

Valerius Ice Cream Brick Carton Filler

No Hands Touch the Ice Cream—Saves Time, Labor and Money

Fills quarts, pints or one gallon ice cream slabs; directly from ice cream freezer into the desired packages. No adjustment required for filling either pint or quart cartons; in fact, both pints and quarts may be run on the machine at the same time.

Does away entirely with the old method, and the unsanitary hand work. The machine completes the entire operation automatically, untouched by hand. The maximum capacity is 24 quarts, or 48 pints per minute. It may be operated as low as 12 pints or quarts per minute.

Little floor space is required. The machine is 2 feet 2 inches wide, by 8 feet long, by 50 inches high to top of hopper. Mounted on large easy rolling castors—can be rolled to one side when not in use. Operated by ½ H. P. Motor, easily connected with any ordinary lamp socket.

A wonderful labor saver. Three girls will operate it to full capacity on quarts, pints or slabs; along with a man to place the filled packages in the freezer room. Where freezers are conveniently located, they may be conveyed without extra handling. Where only small amount of cream is packed only two operators are required to do all the work, from making up the cartons to placing in the freezer room.

It makes no difference whether the operator is filling quarts, pints or slabbing one gallon packages—the capacity is always the same in gallons per hour. If so desired, the operator can reduce this capacity 100% when filling pint cartons, by feeding only one-half as many to the conveying mechanism.

The cartons best used with this machine are of telescopic type, either locked or stapled ends, with preference for stapled ends as these are more easily assembled and present a more pleasing appearance when the package is filled. The approximate inside dimensions of the quart carton are 3½ inches wide, 3⅜ inches long, and 2 5-16 inches deep. Made of manilla stock; Paraffined on all sides making them perfectly sanitary.

Machine filled cartons are full quarts and full pints—are not loose in the package, and easy for the consumer to strip and serve. The size of cartons as above mentioned are standard, as adopted by the large manufacturers. Special machines can be built to order, so as to accommodate any desired size provided same are of same pattern.

For further information and prices, just fill in the coupon and send it to our nearest sales office. Be the first to take advantage of this labor saving sanitary machine in your locality.

DECEMBER 1921

IF there is one resolution the ice cream manufacturer should emphasize above all the others, in determining upon his list for the New Year, it is the one relative to the quality of his product. What the ice cream business of this country needs above everything else is to raise the standard of quality. We need more good ice cream.

Advertising campaigns are all right, and they are indispensable to the business, but they can not bring a successful gallonage to any manufacturer unless he backs them up with good ice cream. By good ice cream we do not mean ice cream that merely complies with some pure food law. Such laws are merely for the protection of the trade and the consumer. They were never intended to build up gallonage. By good ice cream we mean ice cream that is so good that when the consumer eats it he wants more of it and he wants it right away. That is what we call good ice cream.

Too many ice cream manufacturers worry about what their competitors are doing when they ought to be worrying about what the consumer is doing. They try to make ice cream of a quality that will permit them to meet some other fellow's price instead of making ice cream that will tickle the consumer's palate.

Such men make the mistake of their lives. They are letting their competitors run their business for them instead of running their own business. They ought to wake up. The consumer is not looking for "price" ice cream, at least not the second time and the repeat orders are what count. Remember, poor ice cream is not responsible for the increased sales of the ice cream of the country. Good ice cream is responsible. Why fly in the face of the experience of all other food industries and try to build up the ice cream business with a "price" product? It can't be done!

REPORTS from the Atlanta Exposition are to the effect that business was poor, but the exhibits were very fine. Business interests are suffering throughout the South on account of the poor cotton crop and the ice cream industry feels it keenly. But there are better times ahead and the wise business man will hold his business together the very best he can. The pendulum will swing the other way and then he will have the facilities and the organization to take care of the business that will come his way.

The ice cream business is still in its infancy the country over, but particularly in the Southern states. We look for a wonderful growth in that section during the next few years. When ice cream factories depended upon a local supply of sweet cream most Southern cities could not be supplied with ice cream. It has been but a very few years since the introduction of machinery and methods made it possible to manufacture good ice cream without depending upon a local supply of raw material. During these very few years there has been a splendid development of the business in that section. With the coming of better business conditions in general we look for the biggest boom in the ice cream business in the South that has ever come to any section.

SOME ice cream manufacturers follow the practice of "calling in" loaned ice cream cabinets during the winter months, while others either supply the retailer with a smaller cabinet or let him keep the larger one the year round. We don't wish to suggest to the individual manufacturer how he shall handle this problem, but we do feel that there is good argument for both methods.

If the campaign for a larger consumption of ice cream during the winter months is going to win everybody must employ the same methods of doing business the year round. To "call in" any part of the equipment during certain months of the year is merely serving notice that you give up on sales for that period. Possibly this is another reason why many ice cream manufacturers do not furnish cabinets to the retailers. We would like to see a discussion of this subject. What do you do?

THERE is a bit of advice in a recent issue of a chocolate company's trade bulletin which we want to pass on to our readers. This advice is given to the retailer, but we feel that it is particularly valuable to the manufacturer who is in the habit of laying in big stocks of supplies. This bit of advice is divided into three items, as follows:

1st. Buy in quantity according to your needs only.

2nd. Buy more often and keep your stocks new and fresh.

3rd. Don't let any goods hang around on your shelves, they only get stale and eat up your profits.

Some ice cream manufacturers have the habit of buying a season's supply of materials at one time. They try to anticipate their needs and buy heavily during the late winter months. Sometimes they guess right and sometimes they guess wrong.

We believe this is a bad practice. There is an abundance of supplies which the ice cream manufacturer needs at all times during the year. We feel sure that it is better business policy to purchase these supplies as they are needed instead of laying in large quantities in anticipation of requirements that may never materialize.

Of course the purchaser may sometimes make money by "playing the market" and laying in supplies in excess of his needs. He is just as liable to lose money, however. We believe that the purchasing of supplies as they are needed will tend to stabilize conditions and make them more satisfactory for everybody. In other words, make the ice cream an all year round business just as much as possible. Many ice cream manufacturers the country over are making an effort to educate dealers and consumers to look upon ice cream as an all year round food. The tendency is in that direction and we believe it will be a good thing for the business for the manufacturer to run his business as an all year round business just as much as he can.

IN last month's issue we published the photographs of several of the Dixie Flyers, the Texas Association of Supply Men, the Wolf Hounds and the Jack Rabbits. So far as we can learn only one was disappointed with the results. He kicked because his picture didn't compare favorably with the good looking ones. We have reminded him that he should have sent us a better looking photograph. The engraver's art is not sufficiently developed to make a sage brush look like an American beauty, neither can it make a bricklayer look like a lounge lizard. We are glad that all the rest are so good looking that they could not fail to be satisfied with results.

HOLIDAY time is again near at hand and friends will soon be exchanging expressions of good will and friendship. We take this opportunity to express to our readers our appreciation of their support and confidence. We believe there is no trade paper on earth that enjoys the good will of its readers to a higher degree than does The Ice Cream Review. An army of friends out on the firing line is the reason for it.

We would certainly be ungrateful if we did not appreciate these friends. We not only appreciate them but we feel they are the biggest asset we have in business. To retain them will be our constant effort, and we take this opportunity to wish them, one and all, a Merry Christmas and a Happy New Year.

KANSAS MEETING JAN. 26-27.

The annual meeting of the Kansas Association of Ice Cream Manufacturers will be held January 26-27, 1922, instead of December 15-16, as previously announced.

THIS is the time of year when the progressive ice cream manufacturer begins laying plans for next year's business. If his business is expanding one of his big problems is that of equipment. The old must be repaired or replaced and new added to take care of the increasing business.

The question of proper plant refrigeration is always an important one. If his refrigeration is inadequate he will start in early planning on a new installation. It is usually a long drawn out affair and he may have to make some extensive changes in his plant arrangement in order to take care of the new system. It is none too early to plan on next year's refrigeration plant.

IN this issue we begin the publication of the reports of the conventions of several state associations of ice cream manufacturers in addition to the Southern Association. There will be more to follow in subsequent issues. We urge the reader, who may not be in the habit of carefully reading these reports, to do so. He will gain a wealth of information that he can get in no other way. This is the reason we publish them.

ON another page we publish an excellent paper on "Inspection—Is It Worth While?" Be sure to read it.

BULLETIN OF EVENTS

Arkansas Ice Cream Manufacturers Association, Fourth Annual Convention, Jan. 10 and 11, 1922, Hotel Marion, Little Rock. G. A. Meyer, Stuttgart, Ark., Secy.

Mississippi Association of Ice Cream Manufacturers—Annual Convention, Jackson, Miss., January 16, 17, 1922. N. D. Brookshire, Meridian, Miss., Secretary.

Wisconsin Association of Ice Cream Manufacturers, Annual Convention, Hotel Plankinton, Milwaukee, Wis., January 17-18, 1922. F. E. Caughey, Secretary, Madison, Wis.

Louisiana Association of Ice Cream Manufacturers—Annual Convention, New Orleans, La., Jan. 19, 1922. Headquarters hotel to be announced later. N. F. Manning, Monroe, La., Secretary.

Minnesota State Association of Ice Cream Manufacturers—Annual Convention, Hotel St. Paul, St. Paul, Minn., Jan. 20, 1922. W. M. Paulson, Minneapolis, Minn., Secretary.

Association of Ice Cream Manufacturers of Iowa—Annual Convention, Cedar Rapids, Jan. 24-25, 1922. P. W. Crowley, 709 Citizens National Bank Bldg., Des Moines, Secretary.

Kansas Association of Ice Cream Manufacturers—Annual Convention dates changed to January 26-27, 1922. B. T. Perkins, Secy., Pittsburg, Kans.

Ohio Association of Ice Cream Manufacturers—Annual Convention, Deshler Hotel, Columbus, Ohio, Jan. 31-Feb. 1, 1922. Arthur S. Burket, 509 Outlook Bldg., Columbus, O., Secretary.

Michigan Allied Dairy Association—Annual Convention, in Municipal Auditorium at Saginaw, February 14, 15, 16, 17, 1922. H. D. Wendt, General Secretary, Lansing.

Nebraska Association of Ice Cream Manufacturers—Annual Convention, about April 1, 1922. Room 4, Chamber of Commerce Building, Lincoln, Nebraska. R. W. McGinnis, Secretary and Treasurer, 1024 O Street, Lincoln, Nebraska.

Southern Association of Ice Cream Manufacturers

Proceedings of Annual Convention in Atlanta, November 28 to December 2, 1921.

Times may be hard—maybe we are in the midst of a long period of depression—maybe we are not, but judging from the spirit shown at the convention of the Southern Association of Ice Cream Manufacturers during the Supply Mens' Exhibition in Atlanta, the war is over and depressions are about as popular in the South as last summer's Panama is in Minnesota. Ice cream manufacturers poured into the city of Atlanta like a veritable Balveston flood; there seemed to be no end of their coming, and along with them they brought the real old southern pep, the kind that makes southern ice cream conventions so successful.

A number of very interesting and instructive talks were given before the convention. The program was opened by Mayor Key of the city of Atlanta. Mayor Key elaborated on the dairy industry of the South, how the dairy industry had grown in the Southern states and the prosperity which he expects it to enjoy in the future.

NEBRASKA DATES CHANGED.

Our Officers and Directors have concluded that they will change the previous system of holding the Annual Meetings in January. We will hold a business meeting at Lincoln Friday afternoon, January 6, and Saturday morning, January 7, 1922. Business matters of the Association will be taken up and then it will be decided when the Annual Convention will be held. This will be either the latter part of March or the first part of April, and in addition it is the intention to hold district meetings during April at various central points in the State so all members can arrange to attend.

It was previously announced that the Annual Meeting would be held January 23, 1922.

R. W. MC GINNES,
Sec'y-Treas. Nebraska Association of Ice Cream Mnfrs.

Benjamin C. Brown of the New Orleans Ice Cream Company, New Orleans, La., responded with a few well chosen words as follows:

Mr. President, Ladies and Gentlemen: Honorable Mayor, we are here. I bring greetings to you from nine other states. I bring to the heart of the South greetings from the Southern Association of Ice Cream Manufacturers, one of the youngest and second largest of its kind in this country, and that means the whole world.

It is very gratifying indeed for me to see so many here today and when I look back over the few short years when some of the older members of this organization and myself gathered together and thought out this organization, it is indeed a great pleasure for not only myself but I know all the organizers of this body to see so many here at this convention.

We represent today an industry, while it is old nationally, it is a comparatively young one in this part of the country. A business that has grown from a very small beginning until today our sales run up into not less than $300,000,000 annually, and I believe I am safe in saying to you that within the next ten years that amount will be doubled. The ice cream business as I see it in the South is still in its infancy. This can be increased materially by the manufacturers throughout the South in doing just three things. First, quality; making the best possible product that we know how, regardless of the cost. Now that is a big question with some, but with the larger manufacturer I believe that he does not even consider the cost of the product that he is putting out. The next thing that will put this industry to the front and where it belongs will be the service that we render to the public. Now "service" of course is a very big word. It covers a multitude of not only good things but also a multitude of sins. Then one of the outstanding requisites—something that must be done is to educate the public in the subject—to eat ice cream. You all know that the per capita consumption of ice cream in the South is not what it should be. There are two reasons for that. The people here have as much money to buy ice cream with as in the North or East, but, first, we must give them the quality. Second, they must be educated to eat ice cream.

How are you going to educate them? Principally by advertising. That is the quickest and surest way in which to accomplish large sales. So that every man in this room will go home and remember these three cardinal points. First, Service; second, Quality; then third, Advertising—and build his business on those three cardinal principles, and I believe it will only be a few years until we can double the consumption of ice cream south of the Mason and Dixie line.

Gentlemen, I think that the officers of this association are due great credit indeed for what they have done during the past few years. Last year I was unable to be present with you at Macon. At the last minute I was detained and could not come and I felt pretty badly about not being able to join you. I can see here today that we are well represented. The officers should be congratulated for what they have done in the way of getting the ice cream supply men to supply their wares in this building. It is a big undertaking for them and I believe that we should appreciate every effort and give them every support that we possibly can.

"For its easy enough to be pleasant when life rolls on like a song, but the man worth while is the man who can smile when everything goes dead wrong.

"The test of the heart is trouble and it always comes with years, but the man who is worth all the praises on earth, is the man who can smile through tears."

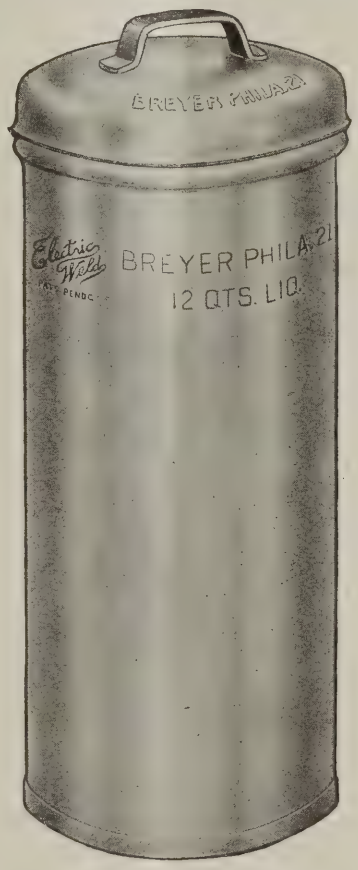
* * *

Hon. J. J. Brown, commissioner of agriculture for the state of Georgia is a firm believer in "quality first, last and all the time". He is a great friend of the dairy industry. His address is in part as follows:

Address of Mr. J. J. Brown, Commissioner of Agriculture of Georgia.

I assure you that it is with a great deal of pleasure that I greet you on this occasion. Just as I went into the office this morning our chief clerk called my attention to the fact that I was on the board at 11:30 to talk to your convention, and he said "I want to call your attention to the further fact that it is a very cold subject you have to speak on." I said, "Yes but I want to call your attention to the fact that it is a very sweet subject," and I hope with the two viewpoints we will be able to say a few words of encouragement to your great enterprise. So, Mr. Chairman, I am glad to be with you and as custodian of the great agriculture of our state I am glad to welcome you into our city. And on behalf of those people referred to by Mayor Keyes I want to say that I concur with the Mayor in his state-

WRITE FOR NEW LOW PRICES



NO SOLDER Electric Weld NO RIVETS

Trade Mark, Registered

"Low Maintenance Cost" Ice Cream Cans
The Weight is in The Plate—All Steel and Tin

The Electric Weld GUARANTEE

1. That no solder, lead or rivets are used in the construction of Electric Weld Ice Cream Cans.
2. That all Electric Weld cans are made of a specially prepared copper-bearing, rust-resisting steel known as "tinning" or "dairy plate" and made of the same gauge material as specified in our advertising.
3. That all welds, being subjected to hammer and pressure tests, are sound and will not crack, break, leak or come apart.
4. That the can is completely assembled in the black before tinning and that it is coated by soaking the entire can in one piece in pure "straits" tin by the old-style hand dip, triple coating process.
5. That Electric Weld cans are of exact capacity and that each can is carefully examined and stamped by our Inspection and Test Department before shipping.

Patent Allowed.

The Electric Weld Ice Cream Can.

The Retinning Feature

Electric Weld Ice Cream Cans may be retinned over and over again at small cost. They are made complete in the black, leak-proof and ready for long service. Every time you retin an Electric Weld you can save approximately 30 cents. Write for prices, list of "Repeat order buyers" and other data pertaining to the **Solderless Can.**

The Non-Deforming Lid

Non-deforming edge keeps the lid round. THE RIM: One-piece expanded bead rim reinforces and protects the can from hard knocks and affords a positive grip for wet, slippery hands. SEAM: Butt welded, solid fusion of the joint that will not crack, break or leak. BOTTOM: A solid flanged leak proof bottom for hard wear and tear. No interstices or rolled edges to collect dirt. Affords a fine grip. Easy to clean. The strongest as well as the most sanitary bottom, three thicknesses soundly welded and solderless.

In 1920 the Horton Ice Cream Co., of New York, bought 2000; in 1921 a repeat order called for 5000 more. In 1920 the Breyer Ice Cream Co. of Philadelphia, Pa., bought 14,000; in 1921, 10,000. In 1920, Colonial Ice Cream Co., Philadelphia, Pa., 1000; in 1921, 30,000. Proof of quality and service in a nut shell.

ment that we are in a period of our history in Georgia, and I feel sure in the South, when we must look to other fields than that of cotton as our main money problem. And to that end we have introduced diversified farming into our state through various branches of our department of agriculture, including the industry of milk and milk products as one of our money crops.

In that connection, we feel a very close association with your people, and with that industry which you represent, and I assure you that you may count on the department of agriculture of Georgia and its pure food department and its dairy department to do everything we possibly can to assist you in the great work that you are doing as consumers of the products by the people that we represent.

It is a fact and I was very favorably impressed with the suggestion of your secretary, that we are all looking to the manufacture of a better product if possible. Now don't understand me to say that anyone is not manufacturing a good product, but I am sure, gentlemen, that the world is willing to consume your product and they are willing to give you a margin of profit above the cost of production that will make your business prosper, and I am sorry that through our food administration, in our pure food department, I must state to you that in some line of industry we have found a tendency, to use the cheapest material possible, to meet the competition of the gentlemen who became excited and cut the price; not being able to meet the price with that high grade product which is so essential for the permanent promotion of any industry. They have met that competition by reducing the cost of the manufacture of the common product and to that end, gentlemen, we have noticed that we have had some little trouble in the enforcement of the pure food laws within the state.

I think it is a mistaken idea at all times to endeavor to meet competition in any way by reducing the grade or the standard of the common product. So I would say that I heartily approve and thank your secretary for the suggestion as that matter comes directly under our supervision in the enforcement of laws charged to our care while commissioner of agriculture; and I believe that the ice cream manufacturers, ice cream dealers, soda fountains and druggists of this country, are composed of as high class gentlemen as can be found in any line of endeavor in our whole country. Therefore, I apprehend that you will have no serious trouble in these times of reconstruction in having enforced these laws of inferior materials put on the market. Now it is true that every line of endeavor has suffered in reconstruction after the war. History tells us that it has ever been so and ever will be so. But I do not fear any evil results, knowing the Southern people as I do, and knowing our resources as I do, I believe that we will be able to hold up the high standard of the products that we manufacture in the South in every line and meet this undesirable competition in these days of reconstruction and put them out of business and allow no one to stay in business in competition with us in any line that does not measure up in the manufacture of their product, whatever it may be.

I take the same position relative to the farmers of our state. I tell the farmers all over our own state and through the cotton belt that the world is willing to take their product, cotton, at cost plus a reasonable profit. Therefore we go before the whole country and ask the whole country to assist the agricultural people of Georgia and of the South in securing for their product cost plus a reasonable profit. And I would be untrue to that great mass of people who produce the wealth of this country if I were not willing as their standard bearer, to concede to the manufacturer the same as to the farmer a fair margin of profit abov ethe cost of production.

I think you will find at all times our department does not taken into consideration so much the price—that is a matter for your judgment; a matter to figure out when it comes to overhead expense and expense of distribution, etc., it is none of our business, but we do feel as we say in the beginning a very deep interest in holding this product to the very highest standard possible. Doing so, it would cost very little trouble in enforcing laws of production and distribution in this state and I feel sure that we will have the hearty cooperation of your association in helping us to see that every product sold in our state measures up to the requirements of the very highest possible efficiency and standard.

I am not going to tax you very long. But gentlemen, there are matters of vital importance that touch every interest in the South in this day of reconstruction. We are suffering now in every line of industry and the reason we are suffering in our state is due to the fact that the farm products of this state are not bringing cost of production. It is impossible for the farmers of Georgia to sell their products today at a price that will pay the cost of production, so that is an absolute loss that has to be sustained. You take the farmer and he owes the country merchant, the merchant owes the country bank, the country bank owes the city bank and so on. All depend upon the price and after that new wealth is forced on the market for less than it cost to produce, there is a loss, as we said a minute ago, that means a great deal to some one. Consequently we are endeavoring today in the great interests of the South to have a system of cooperation, and since the world's great war we have realized the necessity of cooperation between the United States and the allies across the sea. It has become apparent that after the reconstruction period we must learn the lesson of cooperation. I predict that there will be no institution in this country, including the farming interests of this country, that will ever succeed in any other line than that of the very closest cooperation to make people interested in a common industry.

And so I congratulate you upon this friendly organization. Organization does not mean monopoly. It does not mean trust. It does not mean to extort from the people an unjust and unfair profit, but it does mean to so organize that every man who places his money in legitimate enterprise can so conduct his business as to declare a dividend upon money invested. So I am looking forward to a greater day. We are going through the dark hour now, but beyond this dark cloud is the silver lining and as the mayor said this morning, the skies are blue and above all the star of hope is shining.

While some people may be driven into bankruptcy, the spirit of the South is the spirit of America, and, gentlemen, we will come back again. Many a good lesson will have been taught. While some men will fall by the wayside and fail, those men who acted honestly will come back again, and I believe that in the very near future prosperity will prevail throughout the entire nation—the great business interests and the great banking interests will join hands with the industrial interests and will better the economic industries of this country, and we will have peace and prosperity in this country of ours.

America I think is the greatest country on earth. America has taught the world a lesson. It was America that taught Germany the greatest lesson that she has ever been taught possibly in her history. And while we cannot approve of Germany, yet it has been due to Germany's efficiency and the holding up of her high standards of efficiency that made it possible for her to hold the world at bay as long as she did and that in

Bulk Ice Cream In Package Form

EARLY in 1920 experiments commenced with the object of developing a machine for filling Sealright Containers with ice cream. The demand for such a machine came from the manufacturers who had discovered that the cylindrical style of package was the best one for keeping cream in fine condition. . . In January, 1921, the first machine was installed in Howe's Ice Cream Plant in Rutland, Vt. . . The principle of the Sealright process is to displace the air from the package and fill by vacuum—no pressure, spill or push is used, and therefore, no loss of yield. . . These machines are now in use in seventeen states. Many manufacturers advertise this way of packing as their **bulk** cream. That is just what it is—bulk cream in package form, and in one or more flavors. The flavor does not freeze out because Sealright Containers are air-tight. . . We recommend the cylindrical package, but if you prefer a square, we have a fine brick box that may be filled on our machines.

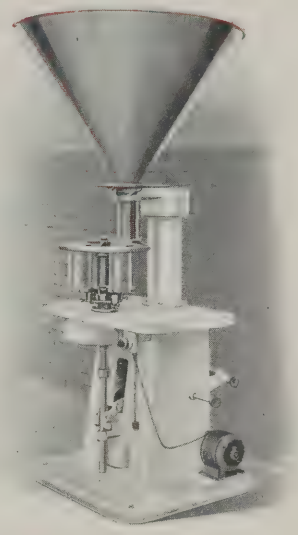
No need to be burdened any longer with the expensive brick method. You can package your good bulk ice cream more efficiently, economically and satisfactorily, using an air-tight package which keeps the flavor in—a package which stimulates sales. See the following pages.

SEALRIGHT ICE CREAM

Fill Sealright Paper Containers with One,

Type "B" Foot Power

SEALRIGHT COMPANY, Inc.



Largest Manufacturers in the World of Cylindrical

FILLING MACHINES

Two or Three Flavors of Bulk Ice Cream

The Machine Which "Had to Be"

A simple, rapid, economical, efficient machine which eliminates the present expensive, cumbersome brick method—one that reduces labor cost, does away entirely with pouring into molds, dripping, slabbing, cutting and wrapping. A machine which will automatically package bulk ice cream without the necessity of the cream being touched by human hands. The Sealright Ice Cream Filling Machine has proved to be such a machine in every plant where it is in operation.

Type "A" Motor Drive

A Type Best Suited for Your Plant

Sealright Ice Cream Filling Machines are furnished in three types—TYPE "A"—motor drive; TYPE "B"—foot power; TYPE "C"—hand power. The first two types come mounted on heavy, strong, vitrified enameled cast iron base. Type "C" with flat base, with provisions for securely bolting on table or work bench. Entire construction throughout is substantial—nothing complicated—no intricate parts to cause trouble, delays or petty annoyances. Type "C" will fill seven to ten packages per minute. Types "A" and "B" are more rapid.

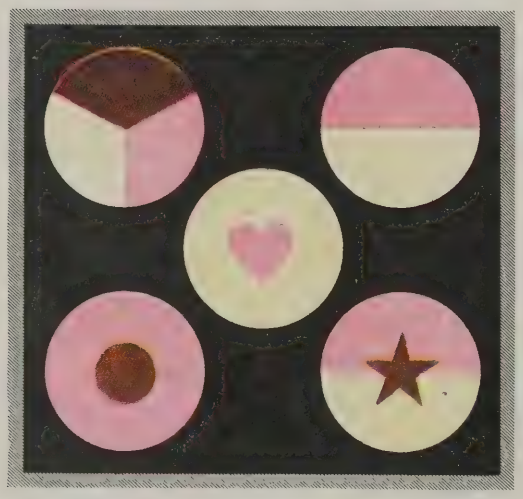
Sealright Filling Machines, and our round and square packages, are fully covered and protected by patents. At the low cost for which these machines are sold, you cannot afford to be without one. Write us for prices.

Type "C" Hand

Here is the Cylindrical Package

Sealright Liquid-Tight Paper Containers are made in our own plant—from the spruce log to the finished product—of our famous Fulton Board. Paraffine is pressed into the pores of the paper—not coated on. They have double bottoms, patented "Inner Seal," and reinforced Crimped Flange. "Sealrights" are neat, attractive, sanitary, air-tight, non-leaking packages. They keep the cream in perfect condition with no loss of flavor. There is no "mushy, melting soft cream." Perfect as a container for ice cream.

See next page for the Sealright SQUARE or BRICK PACKAGE

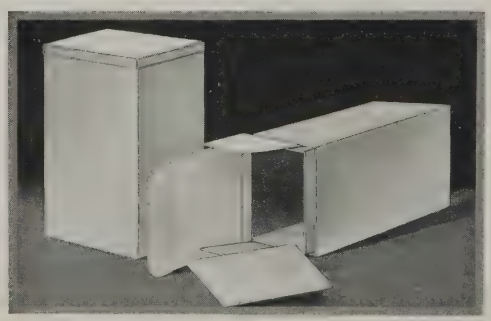


FULTON, N. Y.

Liquid Tight Paper Containers

Note how neatly cream is removed from Sealright Containers. Compare this with the mussy scene attending the unwrapping of the usual brick—and how much easier it is to serve equal portions.

Remember—the Sealright Filling Machine will give you a variety of fancy centers in both the Round and Square Package



This is the Sealright Square or "Brick" Package Patent Pending

A neat attractive inexpensive square package, filled by Sealright Ice Cream Filling Machines, containing exact measure, and solving most efficiently and economically the present brick problem. Thus you have your choice of the square package or round package for packaging bulk ice cream with Sealright Filling Machines.

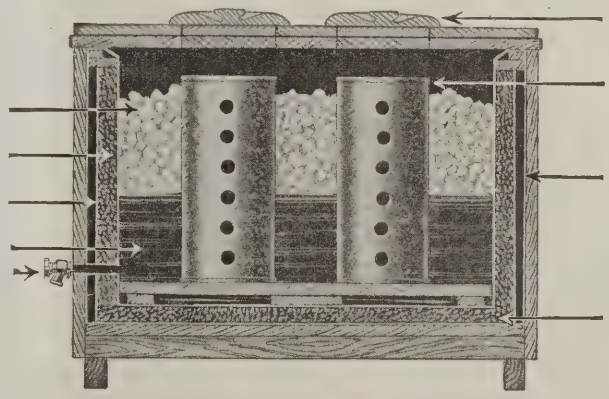
"Quality" Ice Cream Cabinets



have proven 50% more efficient than other cabinets owing to their special construction. They are insulated on all four sides and bottom with a solid wall of two-inch corkboard which is vastly superior to the granulated cork commonly used as there is absolutely no chance of settling down from the top. In addition to this there is a ***dead*** air space between the corkboard and the outer casing. This combination has proven the most efficient non-conductor of heat and cold. They are made in a modern furniture factory where quantity production assures low selling prices.

itself will be a great lesson to the American people in building on a firm basis everything launched in this great country.

In conclusion, let me say that the department of agriculture while it deals with all products, foods, dairy products, drugs and narcotics and every industry, it is the policy and will be the policy of our department so long as I am commissioner, not to retard the progress of the great work that you are doing, but to assist you and to cooperate with you in making your enterprise more prosperous and profitable in the future than in the past, to the end that the more of your product you sell, the more of the raw product will be sold by the farmer and the producer of milk and milk products. It is an honorable institution you represent and a coming institution.

After we have fought a hard day's battle in the great work that we are doing and sunset comes at last, nothing gives us more pleasure or good wholesome enjoyment than to drop into an ice cream parlor, have a plate of ice cream and go to our homes and quietly rest at the end of a well spent day.

Now gentlemen we bid you God speed in making your association the greatest organization in the South. and in making a greater success than ever been achieved before.

My good friend from Macon, J. D. Kinnett, says that I did not go quite far enough, and that instead of having our ice cream before we go home that we should carry some of it into the home. Being a Southern gentleman and to the manner, born, I took it for granted that no Southern gentleman ever partook of that good product that did not carry into his home sufficient amount for his wife and children. If you catch a man doing such a thing, I request that you report it at once to the pure food department, and we will inturn report him.

* * *

Address of Col. M. D. Munn, of National Dairy Council.

Col. M. D. Munn, president of the National Dairy Council was on the program, but being unable to attend, he sent a paper which was read as follows:

I very much regret my inability to be present and personally address the convention of the Southern Association of Ice Cream Manufacturers, but I wish to express my appreciation of the courtesy of your secretary, Mr. Clopton, in permitting me to submit a few suggestion to the members of your association in writing.

It is quite evident that the possibilities of the ice cream industry, as well as its importance to human welfare, are not fully realized by the rank and file of those engaged in the manufacture of this essential food. While the progress and development of the ice cream industry has been repaid during the past five years, and especially so during the past two years, that progress has been the result of circumstance rather than of constructive effort.

So few people even yet realize that when they eat a dish of ice cream they are consuming an essential food. The impression of most is that they are simply gratifying a desire of the palate.

This condition must be changed before the ice cream industry really comes into its own. You men who are engaged in the manufacture and distribution of this essential food must first of all stop advertising it as a luxury, and begin to preach its food value. It is not necessary to praise ice cream as a delicacy or to appeal to anyone to eat it, because of its delicious flavor. Children, as well as adults, realize fully that ice cream is delicious in flavor, and are willing to gratify their taste, so far as the luxury part of it is concerned.

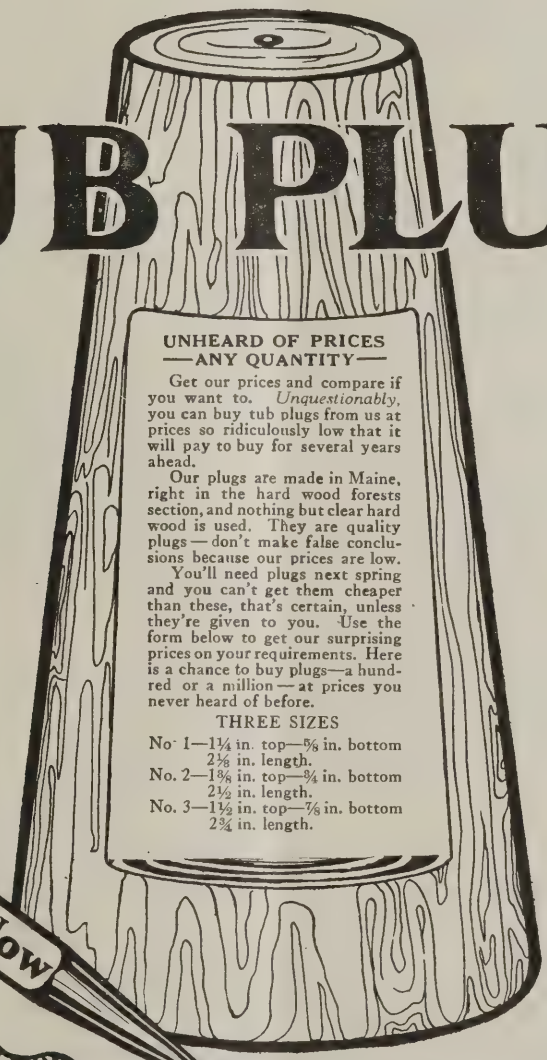
What is necessary beyond this is to educate the consuming public that when they gratify this taste which already exists they are supplying their bodies with a real food; and it is the dissemination of this knowledge that will build the ice cream industry.

One sees so much colorful advertising on ice cream, picturing it as a delicacy and appealing to the palate, rather than to the common sense of the consuming public, in an effort to increase its consumption. I attended a national gathering of ice cream manufacturers quite recently, and noticed a beautifully colored sheet as a sample of ice cream advertising, in which a dish of ice cream was very tastefully displayed, and on this was the statement, "Real Cake".

I say to you ice cream manufacturers, you must change this kind of publicity. What you should say is "Real Food" and not "Real Cake". There is ample evidence of the fact that ice cream is a real food. Hospitals furnish this evidence, research in science furnishes this evidence, and actual every-day experience furnishes it.

What a message the ice cream industry has upon which to build itself, when it has a product that not only appeals so strongly to the palate, but at the same time furnishes the system with the necessary fuel for health and growth! What greater opportunity can any business hope for than the opportunity that lies before the ice cream industry, if those engaged in it will only arouse themselves and take advantage of it.

Let me recite the following facts as disclosing the possibilities that lie before you in your business: According to government figures, there were two hundred and sixty million (260,000,000) gallons of ice cream produced during 1920. Undoubtedly these figures are too low for the total amount of ice cream manufactured during last year. There was considerable made and consumed which doesn't appear in these government figures. Assuming that this amounts to forty million additional gallons, which is undoubtedly conservative, we would have a total of three hundred million gallons for 1920. Using the government figures as to the weight per gallon of ice cream, and assuming that there was a total of three hundred million gallons manufactured, each person in the United States during 1920 consumed a little over fourteen pounds of ice cream, or approximately eleven quarts. One quart of ice cream supplied only six medium sized dishes, so that each person in the United States during 1920 consumed sixty-six medium sized dishes of ice cream. Thus there were nearly three hundred days during which the people of the United States did not taste ice cream..



When you realize that ice cream should be an all year round food, does not this present to your mind a tremendous opportunity for building your business? We must begin to think in terms of a generation and not in terms of a day, and we must begi nto speak in terms of human welfare and not in terms of taste, in connection with your business.

Permit me to urge you to convince yourselves that you are engaged in a business that touches upon human health, child welfare, and national prosperity, rather than a business that is dependent upon the whims of the palate; that when you manufacture and sell your product, you are serving child health and growth, rather than child taste; and that the more extensively you build your business, the more you are serving humanity.

In order to thus build your business and render this service you must standardize your product and insist that all who are engaged in the production and distribution of this essential human food, put out a product of

the very best quality. Then fearlessly tell the consuming public of its value as a food.

When we make food comparisons showing ice cream's real position as a food, we must necessarily base that claim upon a given quality of product. It should be one of the aims of your organization to see that such a quality of product is supplied the consuming public; and then proclaim to the public that such is your purpose. Then educate the public that in supplying such a product you are giving them one of the best human foods known.

You may ask, "How can this be done?" My answer is, "Through truthful, forceful, constructive, educational propaganda." This propaganda should be distributed among womens' clubs, in the schools, and through every health agency and organization that can be reached, and such material should always bear the stamp of sincerity and truthfulness of statement.

Scientific research and investigation, hospital experience, medical observation, all supply ample evidence which can be used in this educational work, and all that you engaged in the industry need do is to see that such information is gathered, and set forth in plain, forecful language and pictorial representation.

The National Dairy Council is supplying material to nearly fifty thousand school teachers, red cross nurses, and home demonstration agents, and other educational and health agencies, through which we are spreading the message of the food value of milk and its products, including ice cream. The ice cream industry should be more materially assisting in this educational work than it is doing at the present time.

We should like to have the members of your organization more intimately coordinated with the educational work that the National Dairy Council is trying to do.

You can rest assured that it will rebound to your benefit in a business way, and at the same time you will have the satisfaction of knowing that such effort is for the best interests of human welfare.

Address of W. M. Sidebottom, President.

The penalty imposed upon the president is that he make an address. I suppose that is because of the high honor conferred upon him. No doubt a large number of the members would like for this to be abolished. I know in the present instance, it would meet with my approval.

In opening this convention, it is with a great deal of pleasure that I extend to you a hearty welcome and hope that you will enjoy every minute of the time. I hope that this meeting will prove both pleasant and profitable to all present.

It might be well for us to pause at this point and look back for a time. Several years ago a mere handful of men, or to be exact not to exceed nine, decided that there must be an organization of Ice Cream Manufacturers in the South; that would take care of questions and problems that confront the Ice Cream Manufacturer of this section. Upon this decision the Southern Association of Ice Cream Manufacturers was organized. In the beginning the Association was composed of Ice Cream Manufacturers and Supply Men traveling in this territory.

The first year was a hard struggle to hold the organization together, but with that determination so well known of our Southern manufacturers, they continued to work hard early and late for its success. Three years ago the association had grown to such an extent that the supply men decided to withdraw and form an organization of their own; so today as we are opening our ninth annual convention, you see before you this great big southern association, and our world renowned Dixie Flyers. We also have with us several state organizations and visitors from Oklahoma, Texas and various other states.

Notwithstanding the wonderful growth of our association, we have not begun to grow in number nor importance, if each of us will decide to do something for the association; so let us all pull together for its success.

At Macon last year the association selected Little Rock, Ark., as the place for this meeting, and quite a number of our members had reason to believe and hoped that the national association would hold their meeting somewhere in the South, but after the poll was taken Minneapolis, Minn., was seclected as the meeting place.

Shortly after this the national association of supply men decided, if agreeable and if it could possibly be arranged, they would hold one of their famous exhibits in the South, in connection with the meeting of the Southern Association. After a great deal of correspondence and a trip, this was arranged, and our meeting changed from Little Rock to Atlanta. After you have attended the meeting and visited this magnificent display, I will leave it to your judgment as to whether this change was wisely made.

It was my pleasure to attend several group meetings in Tennessee and Kentucky, and while everything was not accomplished, I feel sure that a great deal of good resulted from them.

I also had the honor and pleasure of representing the National association, as a representative from the Southern association, to the meeting of the chamber of commerce of the U. S. A. at Atlantic City. Also represented the Southern Association in the directors meeting of the National Association at Minneapolis, and just here I wish to express regrets that there were so few members from the southern territory.

We all know that the ice cream industry depends upon weather conditions, in fact, you hear so many say "Give me good weather in the spring and summer and I will get the business" but we must also have favorable business conditions.

Since the war all lines of business and industries have had their seasons of depression and shrinkage in volume and profit. The ice cream industry held its own until after July 1st, then it seemed that it took a great slump, and has continued up to the present time. I am of the opinion that after January 1st, 1922, business conditions in almost every line will show a decided change, and with the opening of spring we may expect our industry to improve with the rest.

When business is good and profits are large, we may think we do not need organization, but when a slump or depression strikes us we begin to think more of it. Just now our business needs it and we should strive more than ever to keep up a strong organization in state, group, section and national. Every year in some of our states we have a meeting of the legislature; then it is when we need a state organization. Then we have our troubles and problems in group and sections for their consideration. Then comes our big national association, that takes care of the big problems.

We talk about organization, cooperation, code of business ethics, of fair prices and methods. Why all this use of big words unless they have a meaning.

Organization, without giving some of our time to the problems involved, has no meaning. We have a lot of good members who pay their dues promptly and attend the meetings and have a good time, but who never read a paper, discuss questions or problems, or offer any suggestions for the benefit of their fellow members. We all have troubles and problems each year, and if we

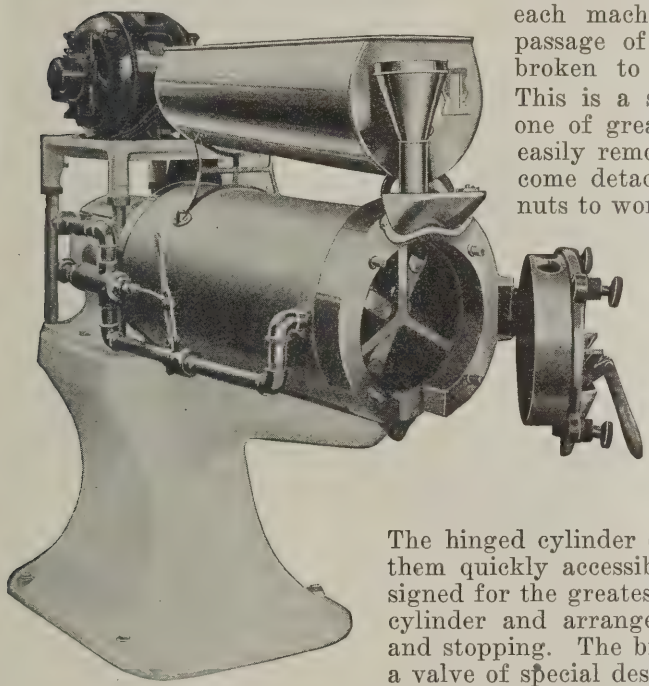
Standard Equipment for Ice Cream Plants



Immediate Shipment from Chicago or St. Paul

Creasey Ice Breaker

Every manufacturer of ice cream, large or small, needs this sturdy machine. Built over-size throughout—stands up under hardest service you can give it.

The size of the broken ice can be regulated by the use of fine or coarse combs—furnished with each machine—which prevent passage of the ice until it is broken to a certain fineness. This is a special feature, and one of great value. Picks are easily removed from drum when necessary, but they cannot become detached when in operation. No rivet heads or bolts or nuts to work loose.

More than 16,000 Creasey Breakers in use; why not put one to work in YOUR plant?

U. S. Brine Freezer

A large capacity freezer, heavily built throughout, with ample bearings and large gears. Furnished for either belt or motor drive, or can be converted from one to the other in your own factory when desired. Electric machine equipped with 3 H. P. motor.

The hinged cylinder cover is standard on all sizes of U. S. Freezers; makes them quickly accessible for cleaning. The brine jacket passages are designed for the greatest efficiency in cooling the cylinder and arranged to avoid all clogging and stopping. The brine flow is controlled by a valve of special design which gives complete control of the rapidity of the freezing process.

U. S. Freezers are made in 40, 60, 80, 100, 120, and 160 quart capacities; there is a size that will exactly meet your needs.

A handsome and practical machine that will pay for itself repeatedly in your plant. Let us give you further details and prices.

Have You This Catalog?

It is one of the most complete catalogs of ice cream machinery and supplies ever published. You will find between its covers the best of the things made by many of America's leading manufacturers —a valuable book for reference. We'll gladly send you copy on request —without obligation.

would share our experience with each other, we might talk about organizations.

Cooperation is our slogan, but what does it mean? We may attend our meetings, pass resolutions, appoint committees, and return to our homes, but if we do not do something for our fellow competitor, then we had just as well take down our slogan.

Code-of-business ethics is a very high sounding word. We adopted a set of ethics at our last meeting. It means that we take upon ourselves a moral obligation to practice fair methods, not only in buying but in selling and coming in contact with our competitors. I am calling your attention to this matter, so that if we ever expect to amount to anything as an association, we must begin to do things. Think it over.

Our future—What may we expect of it? Let us plan something and do it. There are so many problems and questions for us to solve, I would recommend that your coming president appoint some committee to take care of these matters.

I wish to compliment Mr. Clopton, our present secretary and treasurer, and say that he has at all times been ready and willing to do anything that was needed, but he is like the rest of us; when the busy season comes, he must attend to his own affair. Is it not time that we plan for a reserve fund like the national association have, so we may secure the service of a man who can give all his time to the work of the association?

I have said more than I intended, but before closing, wish to thank each and every one of the members for their hearty support and especially the officers and directors.

I trust the members will take an active part in the discussion of papers that will be read at this meeting, for without their discussion we lose the benefit of them.

I hope all will enjoy every meeting and entertainment and return to our various homes with high hopes for a great big business next year.

* * *

Paul C. Mojonnier of Mojonnier Bros. Co., Chicago, spoke on the subject of "A New Era in Packaged Ice Cream." Mr. Mojonnier brought out the same points as in his address before the National Association in Minneapolis, which was published in the October number of The Ice Cream Review.

* * *

Remarks by W. M. Sidebottom.

About three years ago we gave up the service of delivering ice cream to families. Since that time we have endeavored to make up that loss through the dealer and this past year our business increased in the city and we had a shrinkage in the country.

We are trying to make it so easy for the dealer to distribute ice cream that it will be just as easy to sell a pint of ice cream as a box of Uneeda biscuits. We are putting up ice cream in pints, solid blocks, separate flavors, strawberries during the season, etc. Then we put out three flavor blocks. We are making the price to dealers so that they will make more in that way than in the old way. We have found some dealers who would not take time to open a quart of ice cream where he would open a dozen bottles of Cocoa Cola; so we have put out packages in pints. If a man comes in and wants a pint, he can get it in vanilla, strawberry or the three flavors.

This is not going to take the place of bulk, as some at this convention contend. But we try to make it easy for the dealers to handle this ice cream and make him see the profit and benefit, and in our advertisements we try to call the attention of the public to the nearest dealer. We have got different points in the city where we have especially good advertisements and draw the attention to special dealers and we have found that it has increased the business and it will increase the business.

Heretofore manufacturers could not make less than a brick. A family of three or four will eat a quart one day but they get tired of it perhaps, where if they can get a pint they will have it every day, and this has been our plan to increase the business and we have found it very satisfactory. We are looking forward next year to doubling our business in that way.

* * *

THE SQUARE DEAL.

Address of Oliver S. Jordan, president of the Association of Ice Cream Supply Men, before Southern Association of Ice Cream Manufacturers:

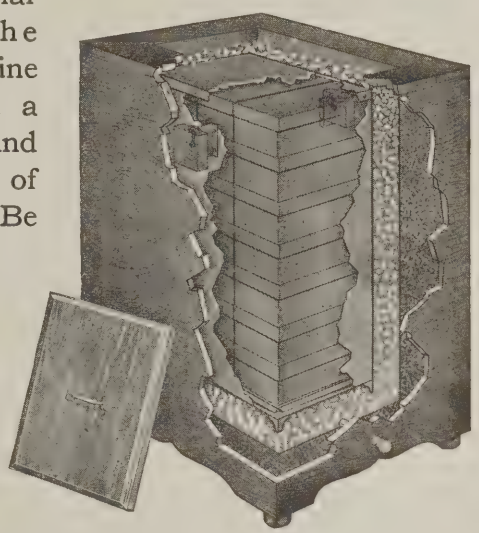
There is not a little justification for our ministers and educators and public men who have been saying that the world is coming into a new day. Of course it is still the same old world of struggle and conflicting interests. But it is a world of broader vision than it used to be—there is more of the square deal in it.

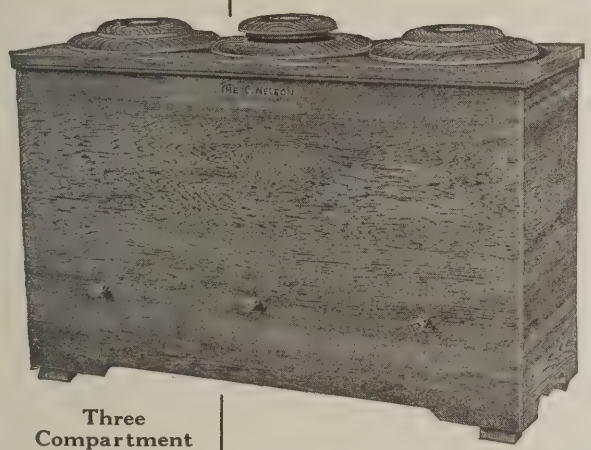
"Everything is fair in love and war" is a proverb almost as old as the race, as I suppose we all know. It embodies in a few short words a conception of philosophy and ethics that has been practiced, instinctively, ever since the cave-man days. It had its most recent demonstration in the last war, when new and atrocious means of combat were developed, and although frowned upon by the world at large, were adopted by both sides. It was war, and anything was fair.

Yet, no one can deny that some sort of a new day is at hand, nevertheless, for our own statesmen and those of half the world besides are now, for the first time in history, really and sincerely trying to look at the other man's problems, the other man's affairs, and the other man's interests to the end that there may be mutual protection and the guaranteeing of general prosperity. If, four or five years ago, some one had stated to the German chemists who were developing poison gas that in the year 1921 representatives of the powers of the world would be conferring on the voluntary scrapping of battle fleets, there would have been a laugh. Yet we are now applying the square deal of mutual prosperity and mutual protection to that very thing.

Although the little proverb about love and war says nothing about business, yet we all know that for centuries business has been considered more or less as just a commercial form of war. The buyer has been the seller's enemy; the seller has been the buyer's opponent. It has been a war not of march and siege, but of bluff and misrepresentation; a war not of army maneuvers and artillery concentrations, but of personal strategems. This is not meant as an indictment of business, which is of course the underlying cornerstone of civilization. I do not mean that busniess men have all been liars or that trade and commerce are essentially and necessarily corrupt. I mean that you all know to be true: that practices have been countenanced by the best of men in business that would not find a place in the dealings of these same men with their friends or social intimates in matters in which business did not enter.

There is another saying, possibly not so well known as the one I have quoted, which the old Romans originated. The Romans, if you recall your ancient history, were noted not alone for military conquest and the laying down of laws which have affected legal practice even until today. They were also very energetic commercial promoters. They planted trading colonies, on distant shores, and they had business dealings with the





Nelson (Patented) Ice Cream Cabinets

"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

peoples of every corner of the then known world. Yet these Romans who laid down what in general were the most just laws that ever up to then had been known, also contributed from their conception of what was fair in business this contradictory maxim to the nations following them: "Let the buyer beware!"

It was up to the buyer. If he could be fooled, lied to, cheated, bulldozed, misinformed—all very well. The more was the credit to the seller. Business was a war without quarter and the victim was the buyer.

This spirit prevailed throughout all commercial undertakings for centuries. It prevailed through the middle ages. It prevailed throughout England's period of colonization. It was always the buyer who must needs beware.

It prevailed in this country to such an extent that I can safely say that the fathers of every man present in this room can remember the day when a man in need of a suit of clothes could not go down Broadway in New York, for instance, or the principal street of any other American city and spend his money with the confidence that he was getting what his money called for. There was no such thing as a one-price system. A salesman sized up a customer as he entered the door of the store. He quoted him whatever price he thought the customer could stand. The customer perhaps haggled and obtained concessions. But haggle as he might he could not really know that he was buying goods at the seller's normal price. It was the same old story: "Let the buyer beware."

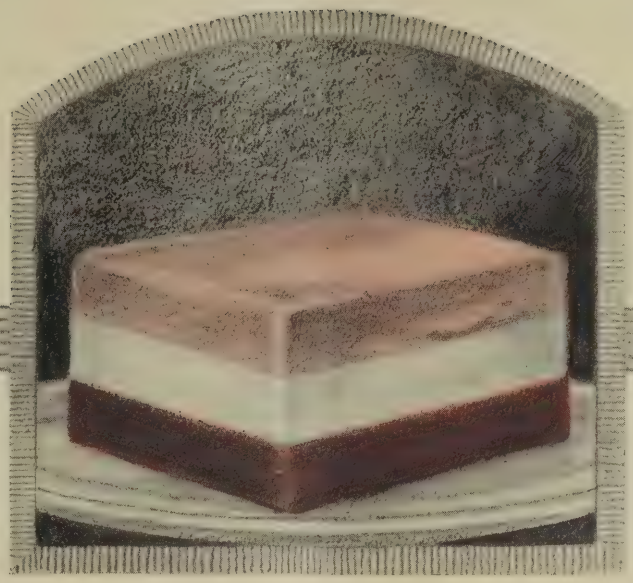
Every one of the gentlemen present can remember when the same sort of conditions prevailed more or less openly in some degree in the ice cream industry. Every one of us here present can probably cite other American industries in which similar conditions prevail openly today. The general manager of one of the large companies of the Association of Ice Cream Supply Men, a company incorporated at more than a million dollars and doing a country wide business, informs me that he would not employ as a salesman any man who has had previous sales experience in a certain industry, which I will not mention, because such men cannot be weaned from practices that are not fair. That particular industry, is shot full of unfair practices, of commercial bribery, of transactions under cover—it is an industry in which the buyer has to beware of every cent he spends. Many of you here can recall instances in which your purchases of supplies or equipment or machinery have been unfortunate. It is not right to deem every unfortunate purchase is a result of misrepresentation on the part of the seller. The buyer's own mind is often not clear on what he needs. It frequently happens that a buyer incorrectly confers, without checking the matter up, that certain goods purchased will accomplish certain purposes. But such cases aside, there are many men here who have doubtless been, to be blunt, "stung" on purchases they have made, and they have had no redress.

I said when I began speaking that our public men and leaders of thought have some justification for saying that the world is entering a new day. I mentioned the amazing instance of co-operation that is now being witnessed in Washington. I believe I can also refer to a circumstance concerning the ice cream industry that is of the same character—and that is the adoption by the Association of Ice Cream Supply Men of its fair practice code.

The limitation of armament conference in Washington is taking some of the unfairness out of war. It is limiting the extent to which national belligerency can go. The fair practices code of the association of which I have the honor of being president is taking the unfairness out of business between seller and buyer in the ice cream industry. It is definitely and in the interests of justice limiting the nature of transactions between supply man and manufacturer.

I explained to you last year the operation of this code, how it affects you as an ice cream man. I explained to you then how, although it does not offer a direct money redress to the buyer, it in fact, offers all of that and in addition a moral redress of even greater significance. I explained to you then how it did not signify a belief by the Association of Ice Cream Supply Men that its members alone sold goods honestly or any effort by the association to obtain the exclusive business of the ice cream industry. Many houses for years acted honorably in their relations with you. Some of them are now in the association and some are not. In or out such houses are equally honorable and to be trusted. But the fair practices code for the first time in the history of your industry, openly and with all the authority that national organization can command offers protection to the buyer. It changes the old motto of "Let the buyer beware" that has prevailed for so many centuries to a new one: "Let the buyer be safe!"

I want to leave you with some words not my own. As president of the Association of Ice Cream Supply Men I naturally take very much to heart its actions. I believe in the association; I know the constructiveness of its methods and its worthiness of its motives. But I wish to let you hear from a source that has no interest whatever in the association, not even an unselfish, impersonal interest, and that is a publication representing the greatest organization of business in the world, the Chamber of Commerce of the United States. This National Chamber of Commerce publishes a monthly magazine which ranks as one of the three foremost business monthlies of the country, which is read by the greatest executives in America and which is to be found in the offices of the most progressive business organizations everywhere. The magazine is called "The Nation's Business," and is doubtless known to all of you.



This magazine in its November issue carries an article showing traces of great research among industrial organizations in the country and into industrial practices, headed "The Right Side of Trade Associations." Perhaps twenty large industrial associations in the country are mentioned by name, representing industries whose manufacturing investments and annual products run into billions of dollars, such industries as the gigantic rubber, paper and pulp, silk and metal industries. Among these great industrial organizations, this article cites conspicuously—not for its size but for the effects its policies are having not merely upon your industry, but upon the general public welfare—the Association of Ice Cream Supply Men. Let me read you what it says:

"A vast amount of the work of trade associations lends directly to the public benefit. An association which adopts and enforces a code of business ethics does so primarily for the guidance of its members, but a secondary but inevitable result is that the public is protected. The fair practices code of the Association of Ice Cream Supply Men furnishes a ready illustration. Here are some things forbidden:

"1. Misbranding of articles as regards materials or ingredients; 'Inferential misbranding,' i. e., using trade names or descriptive terms of unadulterated or genuine goods.

"3. Commercial bribery of customers by money, long-term credits, not in keeping with trade custom, excessive entertaining or any other means.

"11. Selling food or a product to be put into food which, because of its nature or method of manufacture

"We will serve ice cream"

Why not—even though the snow is falling and genuine wintry weather prevails? Why should folks deny themselves, at any time, the pleasure ice cream affords? Why cling to the old idea that ice cream is a summer dish associated only with warm weather? More and more are folks forming the wholesome habit of eating ice cream in any season. "We will serve ice cream," seems a perfectly natural remark for the hostess to make, regardless of season . . . . . This habit of serving ice cream in winter is due largely to the fact that ice cream "is made so good". . . . . We are not unmindful of the part flavor plays in making ice cream taste good; and, of course, B-F Vanilla, and minor flavors, must at all times be so correct in quality that when used folks will gladly say, "We will serve ice cream"—America's favorite dish throughout the year.

When a publication of this sort speaks of the association in such a manner, even its president can have a little more to say.

Gentlemen, the Association of Ice Cream Supply Men, is your friend, the protector of your dollars and a constant and unceasing stimulator of your industry.

* * *

Paper given before Southern Association Meeting
By Geo. L. H. White, Raliegh, N. C.

Mr. President, Gentlemen: I desire to forego the usual apology for the fact that I am not endowed with the art of speech making, for after all its a useless statement and your knowledge of the fact in advance of my talk would not alter or improve the situation, for if I were blessed with the gift of oratory I probably would not be an ice cream manufacturer (can you imagine such a loss to the industry) however, I do wish to apologize for my manuscript and if you will make yourselves comfortable for the next two hours I will unfold to you the mysteries of this lengthy document. Before beginning I request our President to permit any of you, who desire to do so, to pass out.

The subject assigned me by your genial and accommodating Secretary (so accommodating he would not accept my refusal of a place on your program) is one that has been more freely discussed by organizations of ice cream manufacturers than perhaps any other subject and deservedly so as it is one of the most important matters with which we have to contend. I am afraid I will be unable to register any new complaints, offer solutions for your old truobles or enlighten you to any extent and believe that before I have proceeded very far in my remarks that Friend Clopton will feel as the little boy who lead a yoke of oxen home after the days work in the fields. Following the road he came to a fence, here he usually tied the oxen to a stake while he removed the bars of the gate but someone had removed the stake and the boy unconsciously tied the lines to his own leg and proceeded to let down the bars, when the oxen saw the bars down they made a dash for home and of course dragged the unfortunate boy to the stable lot. When he was sufficiently recovered his father asked him if he did not know better, "Yes," replied the boy, "I had not gone two miles before I discovered my mistake." Likely friend Clopton will realize his mistake before I conclude.

I want to depart from the usual point of view when discussing the express situation and instead of taking the matter up from the general theme will try to talk to you about local conditions with which we all have to contend, the things which perplex and worry us every day in the year. Heretofore we have dealt with the big things of the situation, instead of the minor details and consequently we have made only limited progress in making the express service what we would like to have it. It is admitted that express companies like all other organizations of similar magnitude have apparently little regard for the individual that comprises the vast army of contrbiutors to their profitable existence but through such agencies as our association we have been enabled to command the attention of their officials and their consideration as well.

This is one of the many benefits of organized associations.

The express situation affords no end of argument. I find certain conditions are better in some sections than in others but after all is said and done will we get the relief that we think is right and just by continually criticizing them in conventions and other like places or should we decide the corrective measures to relieve our numerous complaints and present them to proper officials for their consideration? The latter plan has proven best in the North Carolina Association and conditions while not normal, are greatly improved.

I sometimes feel that the song we used to sing "These's a whole lot of good in every bad little girl", could be rearranged to fit the express situation. Without them what would your business be today? And if the same measuring stick was as vigorously applied to your business and my business, my opinion is that considering the comparative size, we are as careless as we think they are. The proposition as I see it is one of adopting a future policy of establishing a committee on this important matter to send out questionnaires to ascertain the nature of the various complaints of our several members, then compile these and present them to the proper express official for their consideration. If this measure does not bring the desired relief we might employ more drastic steps and present our complaint to the several corporation commissions. As previously stated the North Carolina association adopted this plan and we presented our complaints to the superintendents of our territory and secured their cooperation which brought about marked improvement in the existing conditions.

From information gathered previously I assume that local conditions are generally accepted as being fairly good. The trouble most of us have is from a source largely made up of the agents in small towns, my observations have caused me to reach the conclusion that those men or women, as the case may be, are usually overworked, being railroad agent, express and ticket agent, telegraph operator, etc. Now then the question of relief from the hardships caused by their apparent neglect and lack of attention to duties. Some of you address them communications, balling them out for existing conditions. Do you think this method has a tendency to improve the service and cooporation you get from this particular agent? Certainly not.

During the early months of this year the American Railway Express officials appeared before the North Carolina Corporation Commission requesting that they be granted an increase in the estimated weights of ice cream, as approved by the Interstate Commerce Commission, our association was notified of this request and took immediate steps to prevent the granting of this increase. We asked for time to prepare our argument and as a result the matter has been allowed to go until this time without disposition. On Nov. 1st it came to our notice that the express companies, both the American and the South Eastern, had put the new rates into effect, based on the increase in estimated weights requested. We made appeal to the Corporation Commission and the new rate was immediately withdrawn. Similar action in every state where the increase is requested is important, for once established it will be difficult to change it.

Where shipments are not dispatched on the train intended and the next train will be too late for the convenience of the customer. Do you take this cream back? We do, on condition that our customer be notified by wire at the expense of the express company, that the fault was with them, the express company also paying us a stated price which represents our profit on the amount involved.

Our greatest source of trouble with express companies is the apparent careless handling and breaking up of tubs. In each case we ascertain from the number on the tub the amount of service it has rendered. If it proves an old tub whose period of usefulness is naturally

limited, we pass it up, if on the other hand it proves otherwise we file our claim and get results.

Another matter which causes us to feel unkindly toward the express companies is the matter of returns on C. O. D. shipments, this is one condition where we deal directly with the agent and is one fo the conditions we attempted to remedy through our negotiations with the express officials.

During the past season we have experienced less trouble from this source than formerly.

The different phases I have tried to bring up for your consideration are mostly of a personal and local nature, however, just as important, for such conditions do exist. Speaking generally—express rates are too high and should be readjusted so that normal industrial conditions of all kinds would be more quickly reestablished. Labor costs have been reduced, there is a great decrease in the cost of general supplies and equipment, which makes for a lower cost of operation for the express companies, so why should not express rates also be reduced.

In conclusion, I desire to again make reference, to the importance of adopting such corrective measures, for the relief of conditions affecting our business, through failures of the express companies and until we make united effort based upon facts, we will not accomplish anything if we cuss and discuss the matter to the end of time. Lets make this an outstanding feature of our association work for the next year, and take the initiative for making it far reaching in effect.

* * *

HOW TO STANDARDIZE THE ICE CREAM MIX.

By R. M. Washburn, Director of Laboratories, International Dry Milk Co., Minneapolis, Minn.

Being scientific is just being exact and careful in all work done, applying to it all the facts obtainable, keeping a record and noting in an unbiased manner the results obtained, in order that the same mistake shall not be made the second time. In this way the greatest progress may be made.

Ice cream making started on the scientific road about 10 years ago. Greater progress in the science, and the art too, for that matter, of making ice cream has been made in the last decade than during all time prior to 1910. This is saying a lot for those faithful and progressive men who have been on the firing line of this industry during this period, when we remember that ice cream making was introduced to America during Washington's first term as president and had been known in Europe in some form for centuries back.

The ice cream which has built business for both manufacturer and retailer and which has contributed so largely, in my belief, to the health and well being of children because of the growth stimulating vitamines, was, and is, scientifically made. And this does not mean tricky combinations of useless material, but just the reverse, the building up of the ice cream mixture by the addition of more milk solids so that it becomes to a yet greater degree a useful food.

In America, about one-third of our school children are physically below par and mentally backward. This is an astonishing condition in the light of the fact that about 97 per cent of this great group of children can be cured of their backward condition by drinking milk, or eating other dairy products, such as cheese, butter and ice cream. Any child who cannot be induced to drink milk should be fed ice cream in liberal amounts.

What Ice Cream is Made Of.

Ice cream is about six-sevenths dairy product and one-seventh sugar, yet we find, on close examination, that milk or cream is made up of no less than five quite distinct classes of food compounds and that these ingredients vary quite materially in the different commodities which are regularly used in making ice cream. For instance, milk may vary 100 per cent in its fat content, or in other words, from 3 to 6 per cent and still be pure milk in all cases. And cream varies in the different cities from 15 per cent to 40 per cent fat, depending upon local customs and demands. Evaporated milk may have practically no fat, or it may have as high as 7 per cent or 8 per cent, while the total solid matter may vary from 25 per cent to 40 per cent, again depending upon trade demands. Some evaporated milk contains sugar for its preservation and is called condensed milk. Such milk usually has about 27 to 28 per cent total milk solids and from 42 to 45 per cent sugar in addition. Powdered milk may have practically no fat, or it may have as much as 28 per cent, and butter so often used in enriching the ice cream compound, varies from 80 to 85 per cent fat. Manifestly, in order that the resulting mixture or compound may be uniform from day to day and best meet the tastes of the majority of consumers, a knowledge of the composition of these various ice cream ingredients is necessary. Though there is some variation, the following table will give the average composition:

Average Composition and Weight Per Gallon.

	Per Cent Fat	Per Cent Milk	Per Cent Sugar	Total Solids	Specific Gravity	Weight Per Gallon lbs.
Water	0.00	0.00	0.00	0.00	1.000	8.3216

W. B. Wood Mfg. Company

Manufacturing Chemists
ST. LOUIS, MO.

By combining three or more of the above mentioned substances, combinations almost without number, may be made. A suggestion as to the best method of working out the combination, the examples in No. 2 are offered.

Table No. 2. Trial Mix No. 1.

	Gal.	Lbs.	Per Cent Fat	Lbs. Fat	Per Cent Skim Solids	Lbs. Skim Solids	Per Cent Sugar	Lbs. Sugar	Per Cent T. S.	Lbs. T. S.
Cream	60	501.0	30.0	150.3	6.24	31.26	....	....	36.24	181.56
Milk	40	344.0	4.0	13.76	8.55	29.41	....	....	12.55	43.17
Sugar	..	142.0	...	....	...	....	100.0	142.0	100.00	142.0
Gelatine	..	4.0	...	....	...	....	....	....	90.00	3.6
Gelatine Water	3	25.0	...	....	...	....	....	....	....	....
Flavor	..	5.0	...	....	...	....	....	....	....	....
		1021.0		164.06		60.67	100.0	142.0		370.33

164.06 ÷ 1021 = 16.06 per cent fat.
60.67 ÷ 1021 = 5.94 per cent skim solids.
142 ÷ 1021 = 13.90 per cent sugar.
370.33 ÷ 1021 = 36.27 per cent total solids.

It will be noted that in this trial every item except sugar is wrong. The fat is too high and the skim solids too low. The total solids are high enough but the high percentage of the expensive butterfat ingredient makes the cost of the mix too high for the average market. These conditions are best corrected by introducing whole milk and condensed milk, very much as shown in Trial No. 2 (Table No. 3).

Table No. 3.

	Gal.	Lbs.	Per Cent Fat	Fat Lbs.	Per Cent Skim Solids	Lbs. Skim Solids	Per Cent Sugar	Lbs. Sugar	Per Cent T. S.	Lbs. T. S.
Cream	40	334.0	30.0	100.2	6.24	20.84	....	....	36.24	121.04
Milk	40	344.0	4.0	13.76	8.55	29.41	....	....	12.55	43.17
Condensed Wh. Milk	20	180.0	7.6	13.68	20.00	36.00	....	....	27.60	49.88
Sugar	..	150.0	...	....	....	....	100.0	150.0	100.00	150.0
Gelatine	..	4.0	...	....	....	....	....	....	90.00	3.6
Gelatine Water	2	17.0	...	....	....	....	....	....	....	....
Flavor	..	5.0	...	....	....	....	....	....	....	....
		1034.0		127.64			86.25		150.0	367.49

127.64 ÷ 1034.0 = 12.3 per cent fat.
86.25 ÷ 1034.0 = 8.4 per cent skim solids.
150.0 ÷ 1034.0 = 14.50 per cent sugar.
367.49 ÷ 1034.0 = 35.54 per cent total solids.

This combination satisfies every requirement so far as chemical composition is concerned. The fat 12.3 per cent is nicely above the 12.0 per cent requirement. The sugar 14.5 per cent might be said to be a little high, but it is a cheap ingredient at present prices and most consumers relish a goodly amount; and the total solids, 35.54 per cent are ample to produce a quality article and a true food product.

Using Butter, Skim Powder and Water.

In many places cream in sufficient quantities cannot be secured at all times and this shortage often occurs during seasons of greatest ice cream consumption. To meet these conditions, the use of sweet butter and skim powder have been resorted to. It is possible, by the use of proper machinery and methods, to reconstruct dairy compounds which may be used quite satisfactorily. In doing this it is preferable that the butter be melted, that the curd, and water, and salt, if any be present, may settle out, the butter oil only being used.

Table No. 4 illustrates the manner in which these substances may be compounded.

This is a particularly easy problem to compute because in a 1000 lb. batch if 12.2 per cent fat be desired, 122 lbs. of butter oil would be used: if 13 per cent sugar is desired, 130 lbs. would be used: likewise with the gelatine and flavor, all these being added together and the amount subtracted from 1000 will give us the number of pounds of water required to complete the compound.

To make this at all practical, however, the ice cream manufacturer must be equipped with some sort of homogenizing or emulsifying apparatus and these machines cost money to buy, to operate and to maintain. Many a druggist, confectioner and small ice cream manufacturer, would be able to do a good business if there could but be manufactured a single powder which should contain all the cream and condensed milk, the sugar and all other minor compounds needed in making standard ice cream. Such a powder is now a fact. It is being manufactured and is for sale to all ice cream manufacturers in non-dairy sections of the country.

Ice Cream From Powdered Mix.

What is this powdered mix? Answer. A dry powder made chiefly of ice cream and sugar, which may be made into standard ice cream by adding water and freezing.

To make a single 10 gallon batch of ice cream, it is necessary simply to dissolve about 16½ lbs. of powdered mix in 30 lbs. water, temperature 130 to 135 degrees, then cool to about 40 degrees and let stand over night to age. Freeze as usual, giving it about 95 per cent to 98 per cent yield. The invention and manufacture of this new powder places in the hands of the small

Table No. 4.

	Lbs.	% Fat	Lbs. Fat	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.	Price	Cost
Skim Powder	100.0	.....	.....	.....	.....	100.0	122.0	.....	.....
Butter Oil	122.0	100.0	122.0	.....	.....	97.0	97.0	.....	.....
Water	639.0	.....	.....	.....	.....	.....	.....	.....	.....
Sugar	130.0	.....	.....	100.0	130.0	100.0	130.0	.....	.....
Gelatine	4.0	.....	.....	.....	.....	90.0	3.6	.....	.....
Flavor	5.0	.....	.....	.....	.....	.....	.....	.....	.....
	100.0		122.0		130.0		352.6		

122.0 ÷ 1000 = 12.2% Fat.
130.0 ÷ 1000 = 13.0% Sugar.
352.6 ÷ 1000 = 35.26% Solids.
..... ÷ 1000 = Cost per pound.

dealers a chance to compete with the big ones without going to the impossible expense of homogenizing, pasteurizing, and much cold storing expense.

The special advantages in using powdered mix are: stock always at hand to meet sudden demands; stock never sour; already pasteurized, homogenized, and fully standardized to meet public health and competitive requirements for the various states. All these benefits and at less cost when, machinery investment, heat, power, labor and quantity are considered, than the natural or reconstructed goods.

Standardizing Viscosity.

No freshly prepared mix is ready to freeze and give results. It is too loose and sloppy, but let it stand cold 24 to 48 hours and it will regain the viscosity lost in pasteurization and homogenization. This regaining of viscosity seems to be due to the action of acid, or better, some good ice cream improver which has the effect of reuniting the threads and shreds and filaments of casein into an interlocking mass of entanglements. The use of an improver or controller places in the hands of the ice cream maker the means for producing high grade and uniform from day to day.

Sandy or Grainy Ice Cream.

The condition came with high solids and is caused by the crystalization of milk, sugar or lactose, and this in turn takes place because present in quantities greater than can be held in solution at so low a temperature as demanded in ice cream. While there is probably but one cause for sandiness, there are several contributing causes. These may be briefly set out as follows:

A. Use of condensed milk that has been condensed too much, or some that has been chilled or even partially frozen after being made, or condensed milk that has been made up into such from skim powder and water, in which the powder had not fully dissolved, but had left a hard core—grain from the powder. Though pasteurization of the mix will usually straighten out these difficulties.

B. Some manufacturers are practically compelled to use skim powder instead of condensed milk and some process and conditions produce skim powder that does not go fully into solution, but merely becomes soft and gelatinous on the surface of the many grains, while holding a hard core at the center, which core starts trouble. Fortunately the very nature of powdered mix prevents this core business, or in other words, powdered mix dissolves perfectly and that is 3 to 4 minutes after the powder has been added to the water according to directions.

C. Temperature warmer than zero F. tends to encourage the formation of sandy grains—keep the ice cream frozen hard.

D. Some manufacturers complain of more trouble from sandiness in the spring season. Whether this is due to a change in the relative proportion of the solids of the milk produced on new grass, or to the warm weather, and consequently slight souring, or to both, is not certain.

The only sure cure for sandiness known to the writer is to lower the total solids in the mix about 33.00 per cent and to follow this by a lessened yield or swell. For example, when a 38 per cent T. S. is given 100 yield, there will remain in a gallon of finished ice cream 1.62 lbs. of food solids. Whereas, if a 33 per cent T. S. mix is given an 80 per cent yield, there will be 1.65 lbs. solids per gallon. This latter will stand up better, dish out better, eat better, than the former, and will not be anywhere nearly as likely to become sandy. A 34 per cent to 35 per cent T. S. and a 90 per cent to 95 per cent yield is generally safe and produces a quantity article.

NEW YORK STATE CONVENTION.

The fourteenth annual convention of the Association of Ice Cream Manufacturers of New York State was held November 30-December 1 at Binghamton, N. Y., and in point of attendance the convention was one of the largest in their history. One hundred and forty-three active and associate members and friends were present. The subjects discussed were of great interest and gave much food for thought. The ice cream manufacturers of Binghamton extended every courtesy to the attendants and they will all be glad when it is time to turn to Binghamton for another convention.

On Wednesday the convention opened at 11 A. M. by an address of welcome, given by Hon. Thos. A. Wilson, mayor of Binghamton. This was followed by the report of the secretary, A. M. LeMessurier of Syracuse, N. Y. After the report of the treasurer, E. A. G. Intemann, Jr., New York, the appointment of committees finished the morning session.

The afternoon session opened at 2 P. M. by an address given by President Wm. Palmer, of Buffalo. Following this address the topic of "Are We Selling Ice Cream or Service," by L. M. McGinley of the International Ice Cream Co., of Schenectady, was ably handled, "Horses and Wagons, Gas or Electric Trucks," by Leon J. Loezere, of the Hoefler Ice Cream Co., of Buffalo, and "How Far Can We Truck and Pack," by H. D. Sanford of the Best Ice Cream Co., at Syracuse, were next on the program.

The evening entertainment was held at the Hotel Arlington. A banquet was in session.

Thursday's program opened in the morning by C. E. Kilburn, of Kirk-Maher Co., Malone. His subject was "Disadvantages in Dealers Handling the Product of More Than One Manufacturer." "The Value of Ice Cream in the Diet" was given by H. M. Lemkuhl of the Rochester Ice Cream Co., Rochester. Walter I. L. Duncan, the well known New York representative for the Elyria Enameled Products Co., gave an interesting speech on "New Machinery."

At noon the Binghamton Manufacturers gave a luncheon party at the factory of the Endicott-Johnson Co.

At the afternoon session, Chas. G. Morris opened the program with a speech on "The National Association: Its Purposes and Advantages." Alex G. Hoefler followed with "The Proposed Code of Ethics." Mr. Hoefler is chairman of the national committee on ethics. "Criticisms and Suggestions" was offered by Thos. D. Cutler.

The directors elected the following officers: Wm. Palmer, Buffalo, N. Y., president; V. F. Jovey, Schenectady, N. Y., vice president; E. A. G. Intemann, Jr. New York, treasurer; A. M. LeMessurier, Syracuse, N. Y., secretary.

The directors are: Amos Hill, Amsterdam, N. Y.; K. D. Hodskin, Binghamton, N. Y.; V. F. Hovey, Schenectady, N. Y.; E. A. G. Intemann, Jr., New York; C. E. Kilburn, Malone, N. Y.; A. M. LeMessurier, Syracuse, N. Y.; H. H. O'Beirne, New York; Wm. Palmer, Buffalo, N. Y ., and P. J. Smith, Glens Falls, N. Y.

Mr. Wm. Palmer, Buffalo, the president of the New York association, is also a director of the National Association of Ice Cream Manufacturers.

Floor discussions were interesting and profitable and benefits were derived from the ideas expressed by the other fellow's experience.

The splendid convention closed with an evening theater party given by the Binghamton manufacturers.

More reports on this convention will be published in a later issue of The Ice Cream Review.

200 Manufacturers For Cleaner, Purer, Better Ice Cream!

Approximately 200 ice cream manufacturers of the United States and Canada are pledged to make cleaner, better, purer ice cream.

They are heeding the United States Department of Agriculture admonition that air is a disastrous ingredient. So, they are making their ice cream without air.

A chain is only as strong as its weakest link. A manufactured food product is only as pure as its least pure ingredient.

Air is loaded with dirt, dust and germs. Whip filthy air into your 100% pure mix and you do **not** purify the air, but you **do** contaminate the mix.

It was an epidemic caused by infected ice cream that started Prof. W. P. Heath experimenting to find a way to make ice cream without air. That epidemic was fatal to two and nearly so to one hundred others. Yet, the plant where this happened was one of the cleanest, finest, most modern ice cream factories in the world. But it happened, just the same.

The advantage in making ice cream the HEATH-WAY is not alone a question of improved flavor — although that counts. It is not alone a question of greater advertising value — although that helps. It is not alone a question of finer texture and better standing up quality — although they count. It is primarily a question of WHETHER OR NOT YOU WANT TO CONTINUE MAKING ICE CREAM WITH AIR THAT IS NEVER CLEAN AND OFTEN DANGEROUSLY IMPURE.

You owe it to yourself to protect your product. You owe it to your dealers to protect their product. You owe it to the people who eat your ice cream to protect them — all of them — from this lurking danger which exists in the air you are whipping into your freezers.

TWO HUNDRED progressive manufacturers have seen the light. Surely you also want the latest that science offers.

Then get in touch with us. You have much to learn about Heathmade Ice Cream. Let us tell you about our method. It does not require any change in your present methods of manufacture or mix. Write to us NOW.

North Carolina Ice Cream Manufacturers Association

Proceedings of Annual Convention held in Atlanta, Ga., November 28 to December 2, 1921

We have heard of state associations having a 100 per cent attendance of their membership at annual meetings, but we do not recall of ever having heard of a state association holding their annual meeting in a neighboring state with 100 per cent of their membership in attendance. However, this was the case when the roll call was read at the opening of the annual meeting of the North Carolina Ice Cream Manufacturers' Association, which was held at Atlanta, Georgia, November 28th to December 2nd, in connection with the Southern Association of Ice Cream Manufacturers' Convention. It must have been very gratifying to the officers of this association to have the loyalty of their membership so well proven by everyone attending this annual meeting, and especially when held out of their own state. This goes to show what can be done by faithful and honest work of the officers of an organization, supported by the co-operation of its membership.

Souvenir presented to those in attendance at the North Carolina Convention. Jug contains the real "spirit" found in the hills of North Carolina. Wonder if that is the way they get the 100 per cent?

The several meetings held by the association were more along the line of business meetings and therefore the usual program with lengthy speeches was done away with. The following is the annual talk given by President George L. H. White:

* * *

REPORT OF PRESIDENT TO NORTH CAROLINA ASSOCIATION.

The officers of the North Carolina Ice Cream Manufacturers Association, decided to hold our annual convention here in Atlanta, in connection with the Southern Association, after first securing expressions from our membership, and while we cannot hope to devote as much time to matters concerning our own association as at previous meetings, we should be able to take up every important subject pertaining to our work, For the reason that the program of the Southern Association is such an excellent one, affording oportunity to hear many noted and experienced speakers we have decided not to attempt any special program for our meeting. I shall briefly outline to you now, a summary of our efforts and accomplishments during the past year.

The board of directors of your association met in Raleigh on February 18th and prepared the following recommendations, "We, the members of the board of directors of the North Carolina Ice Cream Manufacturers Association in session in Raleigh this February 18th 1921, do hereby recommend to the North Carolina department of agriculture that they seek to obtain legislative authority from the 1921 session of the general assembly, now in session, for the enforcement of the following suggestions:

(1) The reduction of present fruit ice cream butter fat standard to 6 per cent.

(2) Compulsory pasteurization of all dairy products going into the making of ice cream.

(3) Enactment of a law governing the cleansing and returning of milk and ice cream containers.

(4) Authority to establish inspection of all ice cream plants.

Signed: W. S. Obenchain, R. P. Blanton, John O. Royall, J. H. Pope, A. E. Dixon, Geo. L. H. White.

This being the culmination of our discussion of these various questions at our last annual meeting.

A conference was held with Mr. W. M. Allen, state food chemist, at which time we presented the above recommendations, as a result, articles three and four have since become laws, article one will be acted upon at the December meeting of the board of agriculture. The second article is problematical but I trust will be incorporated in our laws at some future date.

A conference was also held with superintendent Egleston of the American Railway Express Company with whom we discussed the express situation and arranged for sending out a questionnaire to the membership of the association to secure information concerning unsatisfactory service, the data secured as a result, was compiled and sent to Mr. Egleston who caused all agents and employes of his company in his territory to be notified of our several complaints. An improvement in the service indicated the value of his cooperation.

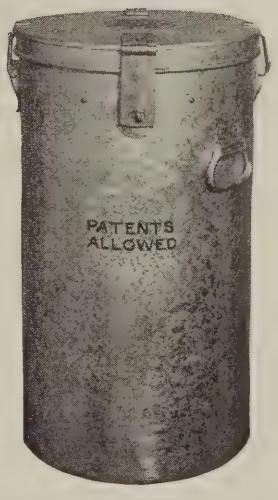
The express companies made application to the North Carolina Corporation Commission to secure the increase of rates in estimated weights of ice cream but before this application was decided upon we requested a hearing, which was promised, but the case has not been called. On Nov. 1st the new rate was put into effect but was recalled as soon as the matter was brought to the attention of the commission.

We have made combined efforts to bring about the abolishment of war tax on ice cream as it should not be classed as a luxury but an essential.

The matter of establishing a course in ice cream making at State College is progressing slowly but I believe we will see it in existance within a few years.

I want to thank each of you for your hearty response and cooperation in making our annual custom of supplying the orphanages in the state with ice cream on Thanksgiving Day a success and hope that the pleasant custom originating in our association will soon be adopted by every state and that by 1923 will become national.

The association has secured several new associated members this year, but I regret to state our active list has not increased.



The officers of the association request that more interest be shown in the work of the organization during the following year. In cooperation there is progress. In progress success. Your suggestions, complaints and criticisms are desired for our mutual benefit.

From information I have secured I am positive the membership has improved the quality of its product. Mr. Allen has advised me that the limited number samples found under standard is encouraging. We all appreciate the benefit to be derived from quality goods.

In conclusion I desire to thank Mr. Dixon for his

Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Iceless Express Container.

What Would it Save for You?

Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover

Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical ways in which they help to develop business.

Decy IceLess Express Container Co.

Incorporated

TIMES BUILDING Room 1001 NEW YORK, N.Y.

untiring efforts and valuable assistance in the work of the association during the past year.

* * *

LOOKING BACKWARD.

By A. E. Dixon, Secretary.

Some one has truly said "Today is the yesterday of Tomorrow," and we have been taught to look forward and forget the past, but somehow your secretary in looking back over the past year in connection with your association, has recollections of courtesies and cooporation from the membership that is most pleasant. It is something he does not wish to forget, and he would like to take this opportunity to thank each one for his assistance during the year.

In reviewing the work for the year, twenty bulletins have been issued at random, dwelling upon anything that was thought to be of interest to the industry. This bulletin feature could be made most interesting by the members sending in contributions of any nature relative to the industry, and have same issued as a bulletin. These contributions could be made a medium of exchange as to opinions or discussions, and besides it would relieve the secretary of being the author of all of them. This plan seems to hold wonderful opportunities, and I would be glad to see it developed in this manner, and I will assist in every way in carrying it out. At the end of the next year, no doubt, its development would bring out something that would show greater results and a larger scope of action.

THE ICE CREAM REVIEW IS OFFICIAL ORGAN.

RESOLUTION ADOPTED AT NORTH CAROLINA ASSOCIATION MEETING

Owing to the fact that the Ice Cream Review is an Associate member of our Organization, it is deemed proper that they become our official organ, and after sundry discussion the following resolution was introduced by Mr. Corning and seconded by Mr. Obenshain:

"Resolved: That the Ice Cream Review be made the official organ of our Association for the ensuing year, and that they be so notified."

The motion was carried unanimously.

It was my intention in writing this article to go into details of each bulletin, but I soon realized this would require too much of your time, and then it occurred to me it would be a good idea to publish them in pamphlet form, together with the proceedings of our business meeting, so that every member would have one for reference. However, it is necessary to again call your attention to the most prominent bulletins in order to show you what has been accomplished by your organization in its efforts, which, I am proud to say, have not been futile.

Selecting the most important I find bulletin No. 2 covers an extract from a letter from the N. C. Corporation Commission relative to the application of the express company for increased billing weights on ice cream. The express companies were to ask the corporation commission for in increase, which they failed to do, but took it upon themselves to increase the billing weights. When the matter was called to the attention of the corporation commission, they stated no authority had been given the express companies to increase the estimated weights, and the express companies were ordered to discontinue billing at the increased weights. The matter is still in abeyance with the corporation commission. The Interstate Commerce Commission has granted this increase in estimated weights in interstate shipments, and the express companies are very anxious to have this ruling apply to all intrastate shipments as well. This increase in estimated weights will cost the customer nearly 15 per cent more in express. Your secretary feels that this is not the time for any increase, but rather a decrease in rates, and if the association wishes to oppose this increase, the matter should be settled now.

Bulletin No. 5. During the session of the general assembly an effort was made to have a "bad check" law passed, and it was introduced by the representative from Cumberland, but the committee never allowed it to be considered. The following is a copy of the proposed law, and if any one can improve it and have it passed at the extra session, it would prove of much benefit to everyone.

An Amendment Referring to the Giving of Worthless Checks.

The general assembly of North Carolina do enact:

1. That Section 340, chapter 975 of the public laws of 1907 and amendment thereto, with reference to the giving of worthless checks, be and the same is hereby amended to read as follows: And upon conviction shall be fined in the sum of not less than the amount named in the said worthless check so given, or imprisoned for a period of not less than sixty days, or both at the descretion of the court; and the court may, also at its descretion, in addition to the above penalty, require the giver of such worthless check to pay the drawee of said check a sum equal in the amount named therein.

2. That this amendment be in force from and after its ratification.

There is no conclusive evidence to the contrary, but the banks do not seem to be very enthusiastic over the passage of such an act.

Bulletin No. 6. At a meeting of the board of directors in Raleigh, N. C. on February 18, 1921, with six members of the board present, the following resolution was passed:

"We, the members of the Board of Directors of the N. C. Ice Cream Mfrs. Association, in session in Raleigh this February 18th, 1921, do hereby recommend to the N. C. department of agriculture that they seek to obtain legislative authority from the 1921 session of the general assembly, now in session, for the enforcement of the following suggestions:

1. The reduction of the present fruit ice cream butterfat standard to 6 per cent.
2. Compulsory pasteurization of all dairy products going into the making of ice cream.
3. Enactment of a law governing the cleansing and returning of milk and ice cream containers.
4. Authority to establish inspection of all ice cream plants.

Signed: W. S. Obenchain, R. P. Blanton, John O. Royall, A. E. Dixon, Geo. L. H. White, Jno. W. Pope.

Mr. Allen, the state chemist, met with us, and was most cordial and enthusiastic as to the enactment of this resolution. Each section was discussed, and it was agreed that sections 1, 3 and 4 could be put into effect, but that section 2 would require some study on the part of the department before it could be made effective. On articles 1, 2 and 3 no progress have been made, but

More Money In Every Sale

There's more *profit for you* when you sell ice cream out of an ECONOMY CABINET—because it costs you less for icing. Then it costs less in the first place and wears longer than most other cabinets, so it saves you money all the time.

"THE ECONOMY"
Ice Cream Cabinet

is fast taking the place of more expensive styles because it appeals to careful dealers. Made in mahogany and other finishes and coated with waterproof varnish. Insulation is finely graded granulated cork, protected by waterproof felt. Picture shows an Economy Metal Lined Cabinet. Made in from one to four compartments, 12 to 20 quarts.

Ask about "ECONOMY" Packing Tubs

Write or wire for catalog and prices. Prompt shipment if you order at once.

HOMER MFG. CO.

HOMER CITY PENNA.

a law was passed in the general assembly relative to the sanitary conditions of ice cream plants, providing for the inspection of each plant, and also providing a penalty for anyone violating same. There has been some trouble in enforcing this law owing to the lack of an appropriation and the scarcity of inspectors, however we think this can be overcome and by next spring it should be in good working order. It is most important that you give this law your cooperation, for it will help you in many ways, not the least of which is the elimination of unsanitary and undesirable manufacturers. This is one of the most important laws relative to the industry ever placed on the statute books, and can be made of great use to us, if properly enforced. The secretary has a limited number of copies of this act which he will be glad to give to anyone desiring same.

The next bulletin of importance is bulletin No. 7, as to securing new members. This year on solicitation we enrolled ten new members, but your secretary thinks we should have at least fifty good working members in our association by January 1, 1923. It has been suggested, and the matter has been taken up with our members, that we take the creameries in our association also, as the interests are so closely allied. We have several combination creamery and ice cream plants in our association, and I think possibly it would be a good idea to let some of the creameries join also. In connection with the new members I wish to state that one of them has certainly gone out of the way to do everything possible for us, and has granted every request. The writer is referring to the Olsen Publishing Company, who own and publish the Ice Cream Review. Had the pleasure of meeting Mr. Olsen, the publisher, in Minneapolis at the National convention, and he stated he would meet with us here. I think it would be a good plan to make the Ice Cream Review our official organ instead of the Ice Cream Trade Journal, for while Mr. Cutler has been very nice, he has not been as active in our welfare as Mr. Olsen. However, this matter is for you to decide.

Bulletin No. 9 refers to the reduction of the butterfat standard in fruit creams, which was the first section in the resolution passed by your Board of Directors in Raleigh on Feb. 18th. It would seem when the matter came up before the department of agriculture, it was decided to postpone any action until December. The committee being made up almost entirely of farmers, they contended nothing should be done to reduce the demand for dairy products. They further inquired as to the butterfat standards of other states and other information before acting upon this matter. During the year no case has been reported of any ice cream manufacturer making cream below standard, and just whether and agitation of this would be wise just now is problematical.

The internal revenue tax is covered in Bulletin No. 12, and again called to your attention in Bulletin No. 16. Your secretary has continuously written our representatives in congress and both senators, urging the repeal, and has also taken the matter up with secretary of the treasury Mellon, who replied on August 8th, enclosing a copy of his letter to the chairman of the committee on ways and means, and referring especially to section 3 of said letter, in which he advocated the repeal of this tax. Secretary of the treasury Mellon also stated a copy of his letter was being forwarded to Senator Penrose, chairman of the committee of finance, and I have no doubt but that the matter will be favorably considered. In this connection, your secretary also wrote approximately 350 letters to retail dealers, urging that they take the matter up, with their representatives in congress. The law repealing this tax has been passed by the senate and is now before the house conferees, and I have no doubt that the "nuisance tax" will be abolished.

One of the most admirable undertakings of our association is the custom of donating cream to the orphanages of the state on Thanksgiving day. Two thousand, seven hundred and sixty-two children were supplied this year, and I think I can state they were abundantly supplied, for the secretary's office has found that the members of the association were not only willing to give the amount they were asked to donate, but in many instances they voluntarily increased their allotment.

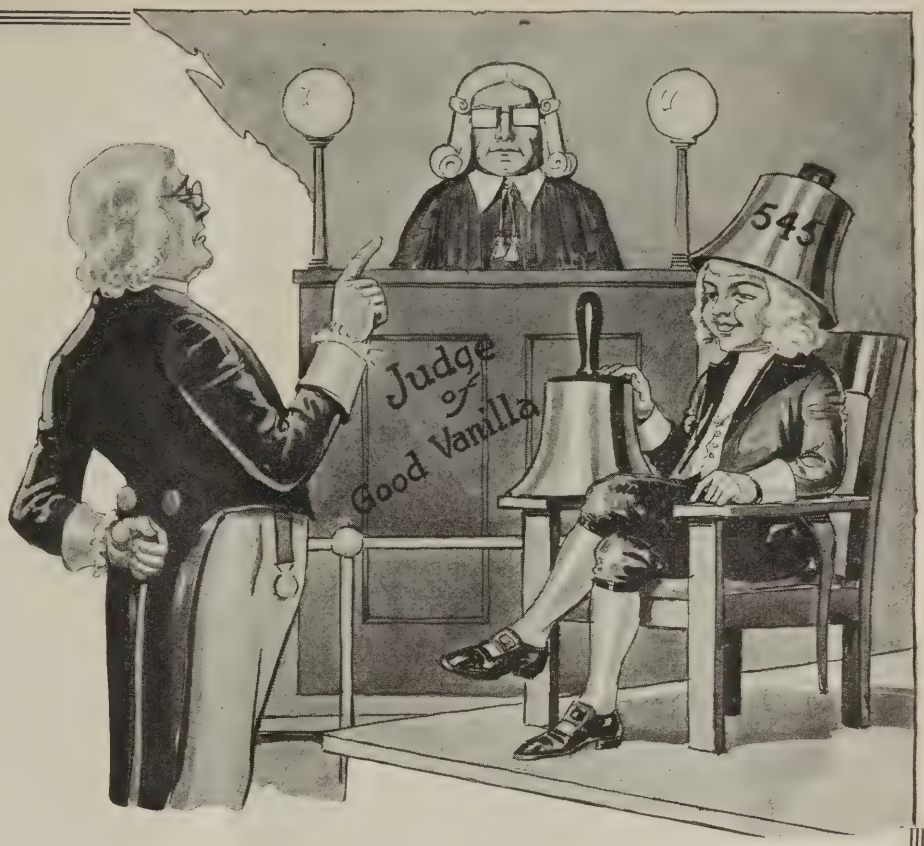
At our convention in Raleigh last December, after the treat had been made the orphanages of the state for the first time, it was unanimously voted that we make this custom permanent, and by the generous cooperation of the membership this year it is shown that this pledge was not made by men carried away by the enthusiasm of the moment, but made by men strong in purpose, animated by the spirit of service and helpfulness.

The custom is such an admirable one, and has met with such universal approval, it is the wish of your officers—and I feel sure I speak for the entire membership—to see it spread to other states, and in due time become a national movement. The amount of cream each manufacturer is asked to contribute is small, and they are many times repaid by the knowledge of the happiness given these unfortunate children, who, bereft of a mother's love and fatherly care, are denied so many of the pleasures and joys of childhood, which makes the treat of ice cream the more enjoyable.

These are a few of the salient points undertaken by your association during the past year. In concluding a review of the year's work, we wish to state that between 1800 and 2000 pieces of mail have left our office, besides the 350 letters as an appeal to the retailers requesting their cooperation in having the "nuisance tax" on the sales of ice cream repealed.

During the year our town and county passed through an interesting experience, which sooner or later those who have not already done so, will have to solve. When our legislator, Mr. Kennedy, failed with the bad check law, he, being a good church member, turned his activities to securing the Blue Sunday law. An old law over 100 years old was resurrected, and the following amendment was tacked on:

"Work in ordinary calling on Sunday forbidden. On the Lord's Day, commonly called Sunday, no tradesmen, articifer, plumber, laborer or other person shall upon land or water, do or exercise any labor, business or work of his ordinary calling, works of necessity and charity alone excepted, nor employ himself in hunting, fishing or fowling, nor the use of any game, sport or play, upon pain that every person so offending, being of the age of fourteen years and upward, shall forfeit and pay one dollar." At the last session of the legislature legislator Kennedy passed his now famous amendment, changing the punishment to a fine or imprisonment in the descretion of the court.



The consequence was that practically no one was permitted to do anything but breathe. We enlisted the local paper, and the plan of taking a straw ballot in the county was conceived. Ballots were placed at all the leading drug stores, hotels, etc., and from every section of the county the votes poured in, giving the idea of the sentiment of the people. The result was overwhelmingly in favor of a sane Sunday as follows:

1. Shall the sale of drugs be permitted on Sunday? Yes, 1637; No. 25.

2. Shall the sale of cigars and tobacco be permitted on Sunday? Yes 1349; No 259.

3. Shall the sale of ice be permitted on Sunday? Yes 1576; No 71.

Billy Bell on the Witness Stand

Lawyer: "Remember, Billy; you are under oath; weigh your words carefully. Now do you mean to tell this Court that your '545' vanilla is absolutely the best vanilla ever offered at the price?"

Billy: "I do mean to say that very thing; and what's more I have never failed to PROVE IT to the satisfaction of every customer who has given 545 a real test."

Lawyer: "But, Billy, don't you know that there are more than 57 other 'varieties' of vanilla—all of them making the same claim?"

Billy: "Sure they make the same claim, or their salesmen do; and it was the salesmen of other lines who were the first to prove to me that I had struck it exactly right in my formula and my process. One by one, **dozens** of them have either hinted or come out flat-footed that they wanted to sell my 545 instead of their lines."

Lawyer: "You say your formula and your process? Will you tell the Court just what you mean?"

Billy: "I'll tell my formula—or part of it—but the process is my own little secret. My 545 Vanilla is 38% straight vanilla extract, made from a blend of Bourbon and Mexican bean. The other 62% is vanillin, coumarin, essential oils, fruit flavors and other things. The vanilla extract gives the real vanilla flavor; the vanillin and coumarin give this flavor a permanence and a kick, while my other ingredients give 545 a delicious individuality that makes the consuming public crazy for more and more of that same good ice cream they got before."

Lawyer: "Do you expect us to believe that?"

Billy: "Will you believe your own tasters? Here (passing out some cones). Test it for yourselves."

Lawyers, Court and Jury: "You **WIN**, Billy."

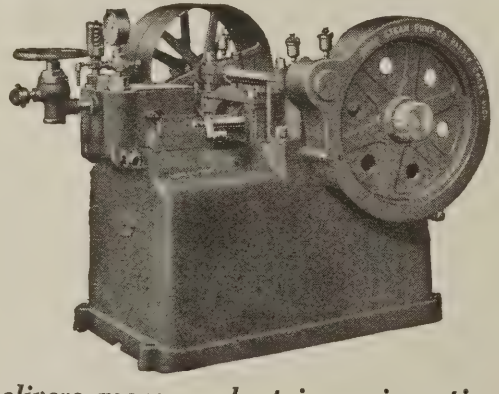
The "Court" of Popular Favor

Everywhere and always decides in favor of "545"—a Vanilla so highly concentrated that 2 qts. flavors a 100 gallon Dairy mix—or fully 200 gallons of finished ice cream.

Let us send you a 2 qt. test sample for $1.90—the barrel price, or a 50 gal. barrel at $3.80 per gallon.

THE TISCO COMPANY *Wm. M. BELL, President* 2 E. Lake St., Chicago, Ill.

Standard Equipment



The

Viscolizer

The *Viscolizer* continues to be standard equipment universally used, in manufacturing plants throughout the United States, primarily because its wonderful performance has given universal satisfaction.

The merits of the *Viscolizer* have become established facts to those who are well posted. The sturdy construction of the machine frees the users from breakdowns. A very hard and non-scoring Viscolite metal is used for the valves.

The option to the buyer of the Differential or Fixed Orifice valve, or the Automatic Pressure Regulating Valve on the *Viscolizer* and the fact that the *Viscolizer* is made in all sizes and to fit all requirements, gives the purchasers an opportunity to select a machine which will ideally fit his requirements.

Delivers more product in a given time.

Costs less to operate and less to maintain.

Lasts longer, depreciates less and commands a higher resale price.

Rogers' Ice Cream Brick-Maker, Too

John W. Ladd Company
DETROIT CLEVELAND

Cherry-Bassett Company
BALTIMORE PHILADELPHIA

4. Shall the sale of gasoline and lubricating oils be permitted on Sunday? Yes 1437; No 188.

5. Shall garages and livery stables be allowed to operate on Sundays? Yes 1343; No 260.

6. Shall hotels, restaurants and cafes be permitted to remain open on Sunday? Yes 1603; No 40.

7. Shall taxis be permitted to operate on Sundays? Yes 1467; No 152.

8. Shall the telephone be permitted to operate on Sundays? Yes 1598; No 29.

9. Shall the sale of candies, toilet articles and other articles usually sold in drug stores be permitted on Sunday? Yes 1229; No 354.

10. Shall the sale of ice cream and soft drinks be permitted on Sunday? Yes 1335; No 255.

11. Shall the sale of newspapers be permitted on Sunday? Yes 1490; No 137.

12. Shall the sale of milk and dairy products be permitted on Sunday? Yes 1601; No 44.

No attention was ever paid to the enforcement, and it is now a dead letter.

To all those who are interested in the matter and wish to know all the propaganda of the advocates of Blue Sunday, I refer them to the Anti-Blue Law League of America. I purchased a number of these memberships, and placed them where I thought they would do the most good.

RESOLUTIONS.

Resolved, that the use of any fat or oil not derived from milk, as a substitute for the whole or any part of the milk fats in ice cream is not legitimate or proper variation of the ingredients which may be used in ice cream mix, variations, selections and modifications among the usual ingredients are desirable in our efforts to meet the desires and even the caprices of our customers, but we condemn the use of any substitute for the vitamine-bearing milk products.

Whereas, in the past, members of this association have in many cases suffered unnecessary loss, owing to lack of proper credit information from fellow-members doing or having done business with the same customer. This committee recommends the adoption of the following as a means of protection of our mutual interests in the future.

For the purposes of this resolution, the name of this credit organization shall be "The Carolina Ice Cream Manufacturers Credit Association".

1st. Resolved that when an account being sold on an open basis by any member of this association shall have become delinquent to the extent that it appears unwise to continue further deliveries on this basis, it shall be incumbent upon said member to report this fact to the secretary.

2nd. When reporting, explanation should be made as to just what efforts have been made to collect and if the customer's refusal to pay is based upon an unjust claim or financial inability, also amount must be stated.

3rd. If a customer who has been reported delinquent and undesirable by a member of this association shall make satisfactory settlement and again become entitled to credit extension, this fact shall be reported to the secretary by the member filing the original complaint.

4th. If any member shall have reason to believe that a report on a given customer was not made in good faith he may submit his complain to the secretary for investigation and special report.

5th. Any member declining to furnish the reports from the association shall not be eligible to receive the reports from the other members.

6th. In order that the work of our efficient secretary shall be reduced to reasonable limits by reason of this additional service, this committee recommends that each member install a card system for handling credit information and keep this up-to-date as notices are received from the secretary, avoiding unnecessary correspondence.

Respectfully submitted for your consideration.

L. A. CORNING,
S. H. SHARRARD,
CHAS. E. LANDRETH,
Committee.

Secretary to send out these notices on 15th and 1st each month from April to October and thereafter once a month.

REVERBERATIONS.

November 28th to December 2nd.

1. Good morning, Mr. Corning!
2. George, how could you do it!
3. Old man Pope met his Waterloo in Gumpert's room.
4. The husband——The Wife——And The Lover.
5. Did Mr. Pope have his hands manicured? We'll say he did.
6. Little Brown Jug. Popular, eh!
7. Some one reported that the Siameese Twins were there. No, only White and Obenshain.
8. They say Royall left young Royall at home one night. We wonder why.
9. And Dixon went to the "Broadway Whirls" TWICE.
10. A new invention: Did you hear Shuford tell the ladies about grafting pig-tails on apple trees and producing sausages?
11. They say Atlanta loves Sherman, only he was a little careless with fire.
12. Dear Members: Can you tell me who made the remark they didn't care about the morning after so long as they weren't deprived of the night before? What's that, Cartland?
13. Who is the champion Blockade runner?
14. And the big Baer was there with the little Baer.
15. Cartland was there too, tho mostly absent.

Thank you boys, for a good time.

Your Secretary,
A. E. DIXON.

ATLANTA.

November 28th to December 2nd.

When the new moon, lucky symbol,
Smiles on mellow Georgia soil,
To that hustling, thronged "Gate City"—
Left behind all thoughts of toil—
Gather men from all the country,
Up from Texas, down from Maine;
Georgia "Cracker" and "Sandlappers,"
"Tar Heels"—purposes the same.

'Tis the Ice Cream Man's Convention
That these pleasured throngs attend;
Ice Cream rules, and words here spoken
Flash the country, end to end.
But there is a deeper meaning:
To our South an honor high,
And we, who love her with devotion,
Extol her beauties to the sky.

We'll show the pilgrim from the Northland,
The visitor from out the West,
That risen from her war-time ruins
Our Southland stands, lovely and best.
Larger, richer, more progressive,
Freed from oppression's hateful chain,
Now like a Queen in all her beauty,
Long in her subjects' hearts she'll reign..

Pals and comrades, our SUPPLY MEN,
Oft esteemed the best of "Friend,"
Let Ice Cream Manufacturers
Thank them for the help they lend.
Thank them, too, for hours of pleasure,
For all they've giv'n in happiness,
And here's a toast we all join gladly:
"The best Luck always, with SUCCESS!"

Chosen Atlanta, favorite daughter,
To entertain the visiting throng,
And she is waiting, expectantly,
As for a lover, tarried long.
She clothes herself in robes of splendor
With light and beauty 'broidered in,
And as a jewel upon her bosom
Her "Welcome" to the Ice Cream Men.

Skyscrapers high against the skyline,
Emblems of Commerce's mighty power,
And placing Knowledge above riches,
Structures to Education tower.
Ne'er stopping in the path of Progress,
By flames and ruins still unmoved,
A wond'rous land of rare achievement—
Atlanta fair, city beloved.

E. DELLINGER,
N. C. Ice Cream Mfrs. Association.

"U. S. GEL"

A Quality Gelatine

UNITED STATES GELATINE

U.S. GELATINE is a clear crystal like product made particularly for the ice cream trade. It is free of odor and dissolves with a smoothness that defies comparison.

As a stabilizer for ice cream, U. S. Gelatine is a distinct product of superior merit.

A two million dollar plant of the most modern and sanitary construction, especially devoted to the manufacture of gelatine is your guarantee of a permanent, reliable supply of a highly uniform product.

The fact that U. S. Gelatine is not a bone gelatine but a "calf" gelatine accounts for its superior texture and fine quality of ice cream it helps to make.

Exclusive Rights on the "Crushes" will Speed up your winter sales

WARD'S Orange-Crush, Lemon-Crush and Lime-Crush Ice Cream Compounds point the way to a great increase in your *winter* gallonage. The newness, novelty and extra deliciousness of these fruit flavors are just what you need to keep your sales going and growing during the cold months when you want business the most.

As delicious carbonated drinks, the "Crushes" have won first place in public esteem. They are better known and oftener called for than any other fruit-flavored drinks in the world.

As Ice Cream and Sherbet flavors, the "Crushes" are rapidly becoming as popular as are the drinks. Many of America's leading manufacturers have adopted them as standard, featuring them in bricks and bulk.

The exclusive rights on the "Crushes" in *your* territory will mean a great gain in prestige and profit—a big boost in your volume this winter.

Reasons Why These Flavors Are Money-Makers

The "Crush" compounds are *genuine*. They give to ice cream and sherbets that richness of flavor, fragrance and color possible only where real citrus fruit flavors are used. They are uniform, giving you full control of flavor and color. *They will not freeze out.* No additional color is necessary.

In the "Crushes" you have six big opportunities—three ice creams and three sherbets. Use them in plain ice creams and sherbets or as layers in bricks. Also to impart extra deliciousness to other flavors.

The "Crush" drinks have always been backed by intensive advertising and selling co-operation. The same will be true of "Crush" Ice Creams and Sherbets. Consider the tremendous value of joining your business with these nationally advertised brands—best known and most popular fruit flavors in the world.

Some Good Territories Still Open

ICR12

CALIFORNIA PLANT PUTS OUT WORLD'S LARGEST ICE CREAM BRICK.

Forty-one and three-quarters gallons of ice cream, made up of 2000 individual bricks and frozen into one giant master-brick, elaborately decorated with ice cream trimmings to look like a cake, was the achievement of the Acme Ice Cream Company, of Visalia, California, recently, an advertising stunt that attracted considerable attention.

The monster brick was the gift of Charles W. Hightower and William Dreyer, proprietors of the Acme plant, to Tulare Lodge, 1425, B. P. O. E., when the Tulare Elks entertained 2000 brothers from all parts of the San Joaquin valley at a venison banquet. It is believed to be unique in the history of ice cream making.

The frozen treat measured thirty-two inches long, twenty-six inches wide and eighteen inches high, containing forty-one and three-fourths gallons of ice cream and weighed 380 pounds. The decorative designs, the work of Mr. Dreyer, included on the top, a perfect elk's head and antlers, the letters B. P.. O. E. and "Tulare Lodge 1425," on one end a flag in red, white and blue and on the other end and sides the clock and other Elk emblems, all in colored ice cream. A special container had to be built to ship the big brick from Visalia to Tulare, and its manufacture and handling involved many problems new to the ice cream industry. The brick, served during the dessert course of the dinner, was cut and distributed to the nearly 2000 guests in less than ten minutes, and attracted even more attention than did the venison which formed the basis of the banquet.—Western Confectioner.

DAVENPORT ICE CREAM CO. BUYS BARR DAIRY COMPANY.

The purchase of the Barr Dairy Co. interests at 518-520 Brady street by the Davenport Ice Cream company, 209-211 East Second street, Davenport, Iowa, and the merger of the two concerns into one plant, was announced Oct. 6th.

The Barr Dairy Co., its real estate and all assets, were first purchased by Chas. S. Brady of Rock Island, Ill. An immediate transfer was then made to the Davenport Ice Cream company.

The two merged businesses will hereafter be conducted at 518-520 Brady street. The idea of the combination is to reduce overhead expenses and at the same time increase the quality of the product, thus giving customers the advantage of both quality and price.

The Brady street site is an ideal plant and is equipped with the latest and most improved machinery. The names of both firms will be maintained in the consolidation, and both well established brands of ice cream, the "Bar brand" and "Banquet brand" will continue to be manufactured. The Second street plant will be closed.

The sale of the Barr Dairy Co. interests include property, equipment, book accounts, good will and all other assets.

The combined plant will have a daily capacity of 8,000 gallons of ice cream.

The application of the Davenport Ice Cream company, authorizing it to increase its capital stock to $100,000, has been approved by the secretary of state.

Blindness to our own imperfections is one of the greatest blessings kind Providence has bestowed.

Why Redwood should be used for Ice Cream Cabinets and Refrigerators

Properties which make Redwood unrivalled for these purposes

ABILITY to keep heat out and cold in, is the test of refrigerator worth. This is directly dependent on the insulating quality of the materials, from which it is made. After experimenting with many kinds of wood, leading manufacturers of ice cream cabinets, refrigerators and cold storage plants have adopted Redwood for the following reasons:

Redwood is a remarkable insulator

The structure of Redwood is distinguished for the regularity in size and shape of its sap cells, and for the uniformity of texture they give. When the sap is dried out, these cells become air pockets—layer on layer of them—which act as almost perfect insulators to heat. With a freezing temperature on one side of a Redwood board, the other side remains at room temperature—does not sweat.

Redwood properly dried is "still" wood

Properly dried Redwood does not warp, swell, or shrink. Redwood "stays put"—joints tight—no bulging or leaking.

Redwood does not rot

Every fibre of Redwood is impregnated with a **natural** preservative which prevents decay from moisture. Acid and alkali solutions, salts and oils do not destroy Redwood. Insects and worms do not attack Redwood.

Redwood is easy to work and can be given any finish desired

With true grain, soft, light in weight and unusually free from knots, splits and other blemishes, Redwood can be manufactured to any dimensions desired with a minimum of labor and a minimum of waste. Its uniform cell structure provides excellent surfaces for holding paint or varnish—enables Redwood to be given any finish desired.

Refrigerator Trucks in Ice Cream Delivery

THE use of motor trucks in the delivery of ice cream and ice has probably called forth as much, or more discussion than any other specialized service of the motor.

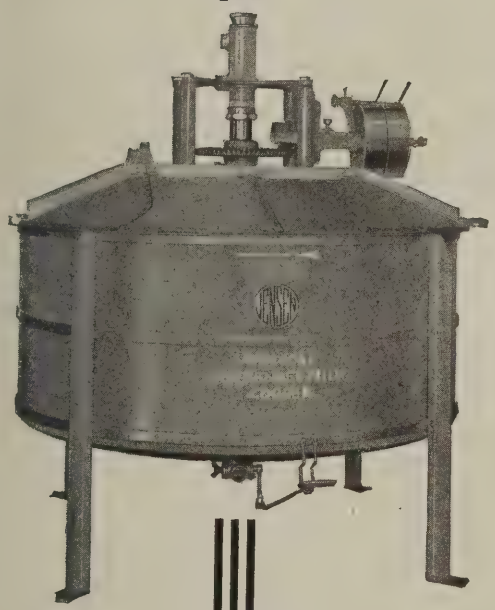
Years ago it was often the subject of controversy in the ice cream and ice industries. The frequency of stops and starts, the special equipment for handling the loads and other questions entered into the argument. But great advances have been made in the adaptation of motor trucks. Men whose business requires specialized hauling service have learned how to use them. Today trucks are proving their efficiency and their economy beyond question in all the transportation and delivery work of lines involving refrigeration.

One of the finest examples is the fleet of Transport Trucks in the service of the Consumers Ice & Creamery Company of Detroit. It is a success that may well be observed for the progress that has been made in equipment, as well as the extension of trade radius, time and money saving and other advantages that obtain generally with the use of the truck. This fleet of six trucks was recently supplied to the Consumers Ice & Creamery Co., by Bennet Williamson Co., Transport distributors at Detroit. Records show that each truck makes an average daily run of fifty miles. Four of them are equipped with trailers, two with closed bodies for 2,000 lb. loads are used for delivering to customers in outlying districts.

The bodies of those trucks equipped with trailers are 14 feet long, approximately 5 feet wide and 5 feet high, inside measurement. The walls are built of 2-inch slab cork, between ¾-inch dressed and matched, making a well approximately 3½ inches thick. The floor and top of the body are of the same construction. Floor is fitted with an ice chute, which delivers ice to rear of trailer in a box underneath the floor of the body. This box is thus just about knee high from the ground and allows the driver to fill his ice pails with a minimum of labor, and without the trouble of climbing into the body. The salt boxes are on either side of the door in the rear end of the body with outside openings as will be noted from the photograph.

The tractors which draw these trailers are constructed from the standard 2½ ton Transport chassis with a very short wheelbase to permit of a small turning radius for easy maneuvering of the outfit. The total length of tractor and trailer is about 24 feet and it can be turned around in this space. Another reason for the tractor and trailer idea is to take advantage of the drawbar pull of the truck. As mentioned the truck is rated to carry 2½ tons, yet when the trailer is loaded to capacity the total gross weight of tractor and trailer is 25,000 lbs. and the tractor starts and draws the load with ease. An ingenious 5th wheel arrangement is mounted on the tractor frame and the trailer is coupled to this by a king pin. This prevents binding when the outfit is working over rough roads, and insures that the two wheels of the trailer will track properly with the rear wheels of the tractor. So as to give proper traction, about a third of the gross trailer weight rests on the tractor frame. This keeps the tractor wheels firmly on the road and prevents spinning.

By pulling a latch on the 5th wheel the trailer may be disconnected, and can be fitted with a jack supporting arrangement so it can be left standing for loading furposes while the tractor may be hitched to another trailer. The fullest use of this idea would allow one tractor to serve several trailers; also it allows the uncoupling of the tractors for repairs without laying up the trailer, saves garage room, as the trailers may stand outdoors, etc.



It is found that the insulation of the bodies makes them very practical refrigerators, and very little ice is lost through melting. In fact, loads have been left in the bodies overnight with no deterioration. A folding step on the rear of the trailer closes the ice box when folded up, and when let down, allows the driver to get into and out of the trailer with little trouble.

The loading of these trucks is an interesting operation. The truck is driven up to the loading platform and the cans of ice cream loaded through the door in the rear of the body. In the center of the roof of truck body is a small door 12 in. square, which, by means of a telescope chute, is connected with ice crusher located above loading

BLANKE MFG. & SUPPLY CO., St. Louis, Mo.

dock, and crushed ice is in this way delivered to interior of truck body, thoroughly covering the ice cream cans, thus protecting the cream and also furnishing the customer's supply of ice. The customer gets complete equipment from the Consumers Ice & Creamery Co.—ice cream, cabinet and supply of ice.

S. S. Gould, Vice-President of the Consumers, says that an accurate record of operating maintenance expense is being kept on the fleet. While as yet this does not cover a long period it shows conclusively the profit as well as the superiority of service of trucks in this work.

For emergency and special deliveries, small Transport Trucks with closed bodies and pneumatic tires are used. These trucks also serve the outlying districts where the stops are scattered, and as they make about 25 miles per hour, they form the necessary adjunct to the regular delivery system to make the system complete and enable the consumers to serve all customers with dispatch.

Pasteurization and Temperature Control

From a Bulletin Issued by The Foxboro Co., Foxboro, Mass.

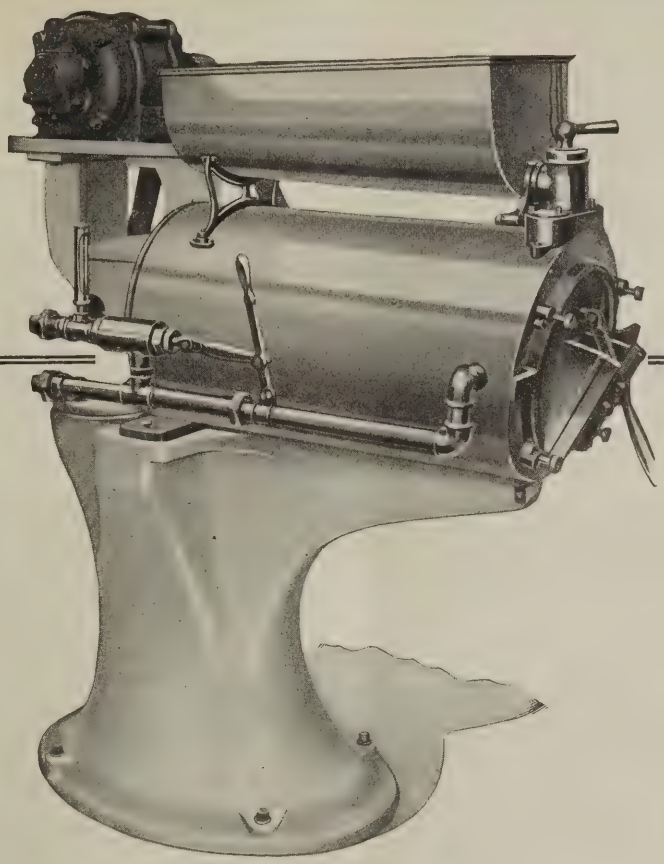
It is only recently that the importance of proper pasteurization in creameries and milk plants has been adequately realized. Employed furtively at first, as a trade secret for the preservation of milk, it has gradually risen to be one of the most honorable, useful, and necessary processes for the safeguarding of the public health. It is now known that proper pasteurization destroys the disease-producing bacilli of tuberculosis, typhoid, diphtheria, dysentery, scarlet fever, etc., which sometimes lurk in raw milk.

In these two directions, then, pasteurization has indisputably proved its value—(a) it increases the keeping quality of the milk and thus saves money that would be lost by too rapid souring; and (b) it destroys all pathogenic organisms in the milk and thus saves lives which would be lost by disease.

There is a third direction, however, in which the growing practice of pasteurization has produced good results. It has created in the mind of the progressive dairyman—whether his chief interest is in market milk, butter, cheese, ice cream, or condensed milk—an active desire to maintain sanitary equipment, and a sense of the fundamental importance of temperature, humidity, and pressure throughout his whole plant, and of the

Art Miller's Booth at the Buffalo Show.

"CHANGE THAT, YOU OLD THUCKER."



The supervisor of a school was trying to prove that children are lacking in observation.

To the children he said, "Now, children, tell me a number to put on the board."

Some child said, "Thirty-six." The supervisor wrote sixty-three.

He asked for another number and seventy-six was given. He wrote sixty-seven.

When a third number was asked a child who apparently had paid no attention called out, "Theventy-theven. Change that, you old thucker."

Brine Ice Cream Freezers

THE manufacturer of Emery Thompson machines began making Brine Ice Cream Freezers when the Ice Cream Industry was still in its infancy. The ever close attention and methods employed today represent a long unsurpassed experience in the development of the finer and heavier brine freezers.

Full open space for brine circulation, automatic cream control valves, solid steel cut gear, heavy drawn nickel silver cylinders are some of the improvements that go to make and emphasize the Emery Thompson as a big, fine, heavy production freezer.

Write for catalog and special photograph of our big machines.

Emery Thompson Machine & Supply Company

271-275 Rider Avenue 6-8 Canal Place (Bronx) **NEW YORK CITY**

necessity for accurate recording instruments that will give him the requisite knowledge of conditions.

Temperature Control.

Next to the cleanliness of the milk, the most important factor in pasteurization is the control of the temperature. When temperature variability may run the cream line and even change the chemical properties of the milk, it is readily seen that absolute temperature control is a necessity. Except for the very small plant, hand control is impossible; and even there the expense of keeping a man constantly at the steam valves comes high, and for accuracy and dependability, however competent he may be, a man can not be compared to a high-grade instrument. With thermometers and automatic temperature recorder-controllers installed, the temperatures of the pasteurizers, tanks, holders, coolers, sterilizers, vats, ripeners, vacuum pans, and every other equipment in the plant can be held to any desired degree; and an accurate record furnished of the temperature during the whole process from the time the milk is dumped into storage tanks, or receiving vats, until the final product is shipped to the market.

Milk Products.

It would be a mistake to conclude that temperature control is concerned only with the handling of whole milk. It enters into every process in the manufacture of milk products. The quality and stability of the finished product is dependent upon its flavor, body, texture, and appearance. The flavor is largely affected by bacterial growth, which in turn is controlled by temperature. High temperatures will cause bad or undesirable flavors, while low temperatures may cause a lack of flavor.

Body, texture, and appearance are determined by moisture content and process of manufacture, both of which are largely controlled by temperature. If cheese is heated too much, it will be dry, hard, and crumbly. If ice cream is not frozen sufficiently, it will be watery and grainy. If the cream for butter making is too warm, the butter will be soft and have a poor body. If the cream is too cold, it will not churn at all, or very slowly.

Successful storage of milk products depends upon the maintenance of uniform temperatures. If the temperature fluctuates, the products will not keep. Bad flavors, poor body and textures develop quickly under poor storage conditions.

Humidity.

The influence of humidity on dairy operations is not so wide in its scope as that of temperature. It is, nevertheless, important. In cheese making, correct humidity is necessary for the functioning of the ripening agency. If the humidity is too low, there is too much evaporation, which will cause unnecessary losses. It is impossible to manufacture milk powder if the humidity is too high; and the successful storage of milk products not hermetically sealed often depends upon the proper humidity.

At the Buffalo Show.

Pressure.

Pressure is not altogether a power-plant question. It is, of course, necessary for the boiler room to generate sufficient power, but how is that power to be used? A constant steam pressure is required for the successful operation of many machines, such as the centrifugal separator. Also it is necessary to run the ice cream mix through the homogenizer at a certain specified pressure. Other processes call for carefully regulated pressures.

The Power Plant.

When considering the installation of indicating and recording instruments, the power plant must not be overlooked. The cost of fuel may run higher than that of any other item in the operating expense; and the waste of steam and water, brine and ammonia, may more than offset the economical administration of other

Excello

The Strong, Sanitary, Easy Handling, Ice Cream Can

HUNDREDS of ice cream manufacturers told us what they wanted an ice cream can to be — and after several years of trial we produced it in Excello. Read Excello's list of virtues and see if they are not exactly what *you* wanted—made to order.

STRONG—to stand the wear and tear of hardest service. SANITARY—the inside smooth, easy-cleaning, non-contaminating. No sharp corners or hard-to-get-at angles. EASY HANDLING—top and bottom edges smoothly rounded. SOLDERLESS, JOINTLESS, WELDLESS — not a speck of solder anywhere no seams, cracks or joints to open up; interior free from welds. LEAKPROOF—guaranteed to stay so for the life of the can. HOMOGENOUS — no parts to pull off, loosen up or form crevices. LONG WEARING—with a special life-renewing feature. And above all, SURPRISINGLY LOW PRICED.

We also manufacture Brick Tanks, Brick Slabs, Ice Cream Pails and Tubs, Milk Cans and Small Churns. Details on request.

SOLAR ICE CREAM CANS

departments. It can not, therefore, be over-emphasized that efficiency and economy in the power plant are fully as important as the control of temperature and pressure in the milk-handling rooms, and that they are just as easily attained.

All this applies not only to large modern plants of complex character, but also to the small plant with its inadequate and, sometimes, antiquated equipment. Indeed, such small plants often offer even greater opportunities for improvement and economy through the installation of the proper instruments. Whether the boilers and refrigerating machines are old or new, large or small, the operators should be provided with high-grade indicating and recording instruments, in order that they may have at all times sufficient information about conditions to maintain a high efficiency and to prevent the loss of costly heat units.

Choice of Instruments.

Finally, the choice of instruments both in the milk-handling rooms and in the power plant should be determined by a consideration of kind, quantity and quality. To overload a small plant with instruments that can not be used to advantage is to gain nothing but expense; yet it is just as shortsighted to attempt to do without those that are really essential to establish a high plant standard. In order to make the installation of instruments an investment rather than an expense, study the performance of the plant itself, note the variable conditions which effect efficiency, and then determine what instruments are needed.

RUFF CONDENSING EVAPORATOR ATTRACTS ATTENTION AT DAIRY SHOW.

The 1922 Special Model No. 6 Ruff Condensing Evaporator, manufactured by the Cream Production Company, Port Huron, Michigan, created more than usual interest at the Dairy Show and the congratulations received by the exhibitors on the many improvements point to a very successful year.

Among the many improvements noted, was that the steam cylinders in the new model machines are stationary and do not revolve like the previous models, the material being composed of a composition of nickel and tin alloy, a perfectly sanitary, nearly a white metal, having no zink in its makeup, the cylinders having a ¼ inch shell, and will last a lifetime. The heating area on the new model has been greatly increased, thus giving full capacity with 10 or 15 pounds steam pressure, in comparison of 30 to 40 pounds as used on the old models, all machines are fitted with large steam inlets which make the application of exhaust steam practicable resulting in a great economy in the cost of fuel, where exhaust steam is available.

The next noted and important improvement is the four revolving wooden scrapers which have replaced the two stationary metal scrapers and with only moderate speed the milk is wiped from the heated shell 100 per cent faster, keeping the cylinders perfectly clean without causing any friction whatever.

In summing up all improvements, the new machine is now built at least 100 per cent stronger, its non-corrosive sanitary metal cylinders will last a life-time, the lower required steam pressure helps to economize the fuel bill and further reduces the heat on the cylinder shell, this, and the 100 per cent more wiping by the revolving scraper enables the operator to make a first class grade of finished product without affecting the albumen even using a much lower grade of milk than is ordinarily fit for making condensed milk. Further, the revolving scrapers wonderfully assist in the agitation and breaks up the foaming of the milk.

The Ruff Evaporator & Process is without question the only evaporator of its kind. It is claimed that its particular manner of operation tends to remove strong taints from the milk, such as garlic and other undesirable flavors often found in the milk delivered to the creameries in the different seasons. The machine requires less labor to clean and is of perfect, sanitary construction.

The Ruff Evaporator has also proven itself a successful pasteurizer and the manufacturer guarantees to raise the score on ice cream mix and cream for table use or making into butter.

"AMERICA'S GREATEST FOOD DESSERT."

The following clipping is from the New Orleans Times-Picayune. It shows how a live ice cream manufacturer can stir up interest in his product "America's Greatest Food Desserts," descriptive of ice cream, might be used in a national way by ice cream manufacturers. Why not make it as well known to the people of this country as "Say it with flowers?" Here is the clipping:

"America's Greatest Food Dessert" is going to become Louisiana's winter nourishment, if the ice cream plans of E. B. Geisel, recently appointed manager of the local Anheuser-Busch plant, are carried into effect.

Mr. Geisel is the author of the phrase "America's Greatest Food Dessert" descriptive of ice cream, but Mr. Geisel, who has spent seventeen years merchandising Anheuser-Busch products in various parts of the United States, is not satisfied to see Orleanians eat ice cream merely as a hot season refreshment. Mr. Geisel believes that ice cream, first of all, is a great food and that there is no reason why this food luxury is not appreciated and eaten all the year round in New Orleans as it is in the North.

Speaking of the ice cream trade as he found it here on his arrival from Boston, Mr. Geisel said:

"Ice cream retailers have lost thousands of dollars worth of winter trade, for the eating of ice cream during the cool months is an undeveloped custom in New Orleans. I believe that when the people of New Orleans learn to eat more ice cream that is rich in butter fat and so free from water that it is always smooth and pleasing even on the coldest day, that the retail ice cream dealers of New Orleans will awake to find a great source of additional winter revenue open to them.

"Ice cream is always a refreshment. But real ice cream, the kind that lives up to a high analysis of butter fats, is more than a refreshment. It is the richest of foods. It is recommended by food specialists everywhere, prescribed in hospitals and in the North practically as much ice cream is sold there in winter, than is sold here at any time.

"When the people of New Orleans have learned to look upon ice cream as a winter food instead of a passing summer refreshment, Orleanians will be eating a better food and retailers of ice cream will have found a new volume of business. The point to be brought home to the people of New Orleans is that winter is the time to eat it for food."

Money Can't Buy a Better Machine Than the Gaulin Homogenizer

THE owner of a Gaulin Homogenizer is assured that regardless of what he spends, he cannot purchase a finer built or more efficient Homogenizer.

The Original

The Gaulin was the orginal machine in America designed for making products homogeneous or viscous. Although its wonderful efficiency attracted a number of competitors, it has been as impossible for the imitator to equal the performance of the Gaulin as it is for an imitation diamond to equal the brilliancy of the genuine.

Made with Painstaking Care

The working parts of the Gaulin are made with the same painstaking care as those of the finest custom built automobile and of as fine selected materials. Its excellent construction is reflected in the long life of the machine, many of them having been in use ten years or more.

The Gaulin Spring Homogenizing Valve

The Gaulin Homogenizer is the only machine equipped with the Gaulin Spring Homogenizing Head which homogenizes all parts uniformly fine. Furthermore, this is the only machine by which the whole mix can be homogenized at a pressure of 4,000 lbs. and the pressure maintained without the constant attention of an operator.

Write for interesting booklet entitled "The Story of the Homogenizer."

REPORT OF THE NATIONAL SECRETARY.

Chicago, Illinois, October 1, 1921

Mr. Chairman

Gentlemen of the Convention:

I take pleasure in submitting herewith a report of my work as your Secretary during the past twelve months:

FINANCIAL REPORT

Cash on hand October 1, 1920		$ 3,283.89
RECEIPTS:		
Active members	$22,969.76	
Associate members	2,575.00	
State Associations	705.00	
Cost Accounting forms	231.15	
Interest on Liberty Bonds and Bank Balances	755.70	
Membership lists	55.00	
Miscellaneous receipts	1.00	$27,292.61
		$30,576.50
DISBURSEMENTS:		
Printing 1920 Convention Proceedings	$ 639.50	
1920 Convention Expenses	314.00	
Badges for 1920 Convention	331.30	
Reporting 1920 Convention	212.89	
Badges for 1921 Convention	216.00	
Reprints of Moore Bill hearings	105.08	
National Dairy Products Committee	2,000.00

GENERAL REPORT

During the period covered by this report ten bulletins were sent out, as well as a number of circular letters.

These bulletins and letters covered a wide range of subjects.

Bulletin No. 37 directed attention to a new income tax ruling dealing with the valuation of inventories, as well as notice of the discontinuance of food licenses under the Food Administration, and also gave a review of general business conditions as reported by the Federal Reserve Board. With this bulletin was also enclosed copy of the constitution and by-laws revised to October 14, 1920.

Bulletin No. 38 referred to our Uniform Cost Accounting System, again urging upon members the desirability of adopting the system.

Bulletin No. 39 referred to the application of the American Railway Express Co. for change in estimated weight on Ice Cream Shipments, calling special attention to the denial of the request of the carriers for an advance on returned empties; it also made mention of the rescinding of the double tagging rule.

Bulletin No. 40 referred to new income tax regulations covering the proper classification of traveling expenses, the tax on dues to commercial organizations, and the filing of income tax returns. It also called attention to the fact that binders for bulletins could be secured through the Secretary's office, and gave further information in regard to double tagging.

Bulletin No. 41 referred to some Treasury Decisions,

Vanite

MINNEAPOLIS MINN., U. S. A.

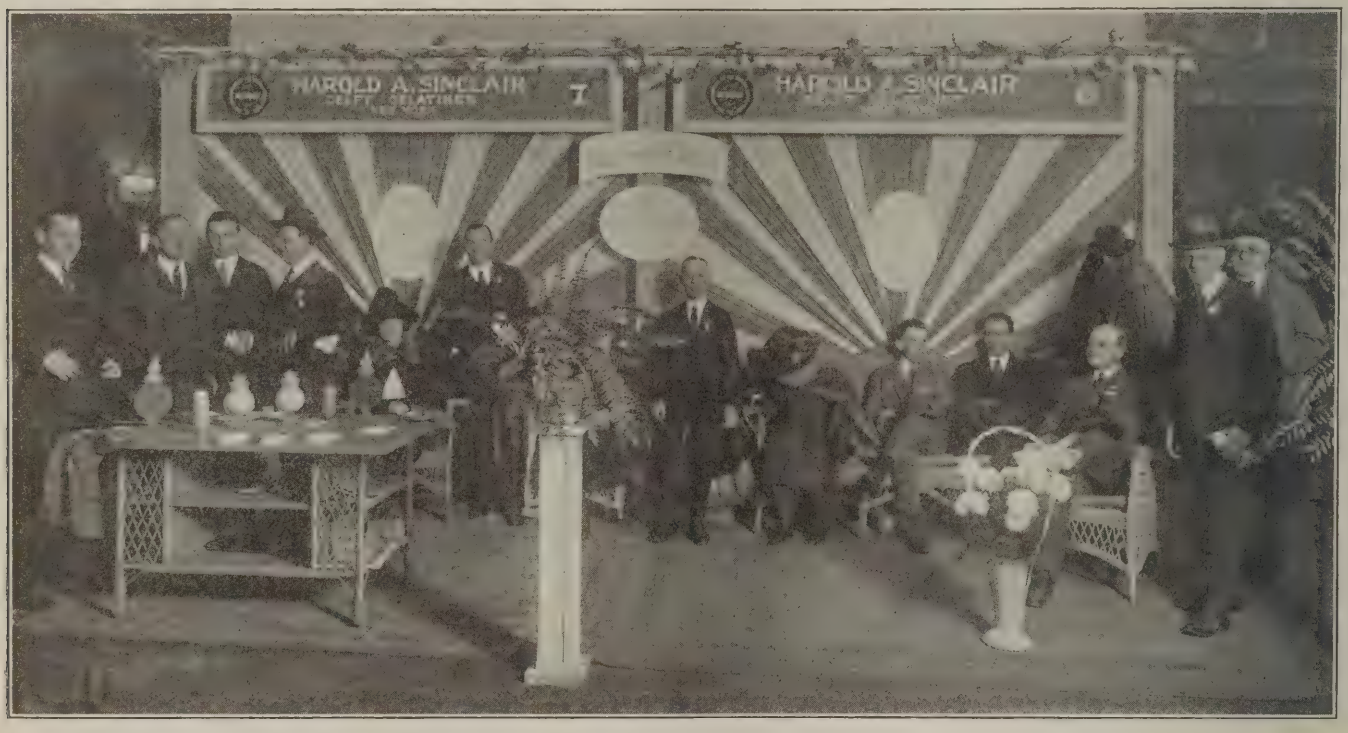
WE wish to express our appreciation for the large number of inquiries and orders we have received from old established ice cream manufacturers within the last few months. It is very gratifying to the men who have labored arduously to perfect this better vanilla.

We are justly proud of the results our customers have obtained since standardizing on C. W. Brand Vanilla. It is gratifying to us to know that we really are in a position to help other progressive manufacturers to produce ice cream that will taste better.

The consumer will go past one store to buy ice cream at another if the other man's ice cream tastes better.

The Widlar Company of Cleveland, Ohio, who manufacture C. W. Brand Vanilla, will be glad to show you that your ice cream can really be made to taste better.

setting forth the proper method of valuing inventories under the revenue law.



Bulletin No. 42 referred to the work of the Committee on Research Laboratory, quoting a communication from Chairman A. B. Gardiner of that Committee asking members to present their views and suggestions with regard to the Laboratory. National Dairy Council leaflets were also sent with this bulletin, and mention was made of the new membership certificates issued by the Association.

Bulletin No. 43 dealt with the work of the War Finance Corporation in granting loans to finance the export of condensed milk and other milk products; it also gave information as to the Federal Reserve Board's review of business conditions.

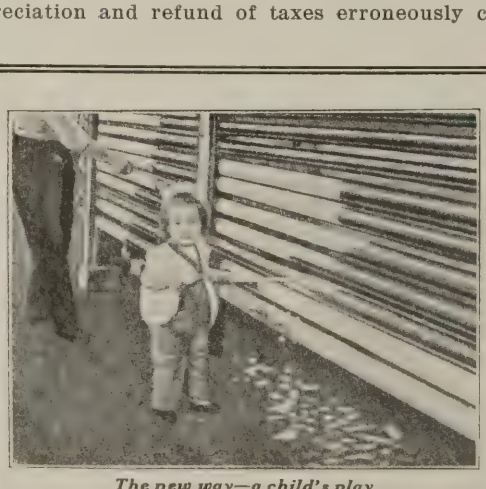
setting forth the activities of the Association's Committee on Tax Revision. With this bulletin was also enclosed copy of membership list revised to April 1, 1921.

The Secretary's office also addressed the franked envelopes for Dr. O. E. Williams of the Department of Agriculture, in order that he might send to our members copies of the Department's publication entitled "Sandy Crystals in Ice Cream: Their Separation and Identification".

These various bulletins prompted a large number of inquiries for additional information on many of the subjects referred to. The volume of correspondence has increased tremendously during the past year and has covered a great variety of matter. The increased correspondence, however, is particularly gratifying, indicating, as it does, the

Where "Delft" Was Exhibited at the Buffalo Show.

Bulletin No. 44 referred to developments in the express classification matter, to Department of Agriculture publication, and to reprint from the Journal of Dairy Science, this reprint being copy of an address delivered by Dr. O. E. Williams of the Dairy Division, U. S. Department of Agriculture, entitled "Proportioning the Ingredients for Ice Cream and other Frozen Products (the Balance Method)."



Bulletin No. 45 made further reference to the attitude of the National Association regarding the use of foreign fats as substitutes for milk fats in Ice Cream, asking that members report any instances of this nature coming to their notice.

Bulletin No. 46 referred to new income tax rulings on depreciation and refund of taxes erroneously collected, also

fact that the mebers were appreciative of the service the Secretary's office was endeavoring to render.

A review of the correspondence in our files indicates that between twelve and fifteen thousand letters were written during the past year, this being in addition to circular letters, requests for payment of dues, etc., etc. Many of the communications received from members referred to matters that necessitated a great deal of detail work in obtaining the desired information.

I attended the conventions of the Illinois, Indiana, Ohio, Michigan, Wisconsin and Minnesota associations, as well as a special meeting of the latter association at Duluth and the express hearings of the Ohio Association, the Wisconsin Association and the Minnesota Association, also several trips to

the Twin Cities looking after Convention arrangements. All of these conventions and meetings I attended at my own expense.

A persistent campaign for increased membership was kept up during the year, as a result of which ninety-six new active members have been obtained.

You will therefore observe, from the number of new memberships obtained, from the results of our continued activity in the collection of dues, and from the financial report as read, that the Secretary's office has been more than self-sustaining during the past year.

In conclusion I wish to thank the officers, members of the Executive Committee, Directors and members of the Association for their kind co-operation during the past twelve months.

Respectfully submitted,

N. LOEWENSTEIN,
Secretary.

EASTERN ICE CREAM EXHIBITION.

No event of greater interest to the ice cream industry of the country has ever been known than the Third Annual Eastern Exhibition of the Association of Ice Cream Supply Men, heralded for months as the largest exposition of ice cream manufacturing essentials ever known, which came to a successful close November 5th in Buffalo. The exhibition lasted a full week and was held in the Elmwood Music Hall.

In attendance, the exhibition rivalled any that ever has been held in the service of the ice cream industry. Approximately 1,250 persons signed their names at the registration booth, giving their affiliation with the manufacture of ice cream. Of this number a few less than 700 registered from various ice cream plants.

One hundred four separate displays made up the exhibition. Exhibitors' plants and offices according to the exhibition directory are located in fourteen states. An inspection of the same program reveals that the products and services ready for inspection originated or produced in states literally from coast to coast, some of the exhibitors being distributors of products other than their own.

The 650 ice cream men registering traveled to Buffalo from twenty states and four Canadian provinces. The exact states represented were: Colorado, Connecticut, District of Columbia, Illinois, Indiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Hampshire, New York, New Jersey, Ohio, Pennsylvania, Rhode Island, Vermont, West Virginia, Wisconsin; the provinces, New Brunswick, Nova Scotia, Ontario and Quebec.

Considerable interest was evoked by displays of new machinery developments. The exhibition included also some very interesting developments in refrigeration, both for packaging and for the bulk delivery of ice cream. The management announced before the exhibition that 150 varieties of products or services would be displayed or explained on the floor.

The week's program included a stag attended by more than 500 men Tuesday night and on the same evening a theater party for nearly 100 ladies, a subscription dinner, vaudeville and dance on Thursday evening, attended by 400 men and women, and a dance Friday night, all of this entertainment being held in the Lafayette Hotel.

Audel's "Answers on Refrigeration"

A practical treatise for engineers. This book is the most complete work on the subject of refrigeration and ice making on the market today. 690 pages. Half leather binding.

Making the Public Want Ice Cream

Pictures of pretty girls in hammocks, fairies, mules kicking darkies, etc., are very clever and nice but they don't make the public *want* ice-cream.

The outstanding merit of Mathews ice-cream merchandising plan is that it's founded and grounded on the one idea of "make the people want ice-cream."

You can't show actual ice-cream sundaes in your dealer's windows—too perishable! but you *can*, by miraculously truthful illustrations make "let's have ice cream" *the* household word in your city.

Some manufacturers complain "we can't get our dealers to use ice-cream display material!" Of course not—the display advertising wasn't built right—*you* wouldn't use it if you were the dealer.

But—he will use display material that makes the people want ice-cream—unless he's blinded to more profits—and not many dealers are that!

The sooner you talk to the Mathews man, the sooner you'll start the stream of greater profits in your direction.

"Servants to the Dairy Industry"

OKLAHOMA ICE CREAM SHORT COURSE.

December 26 to December 31, 1921, Stillwater, Okla., A. & M. College.

Come to Stillwater for the fourth annual ice cream week.

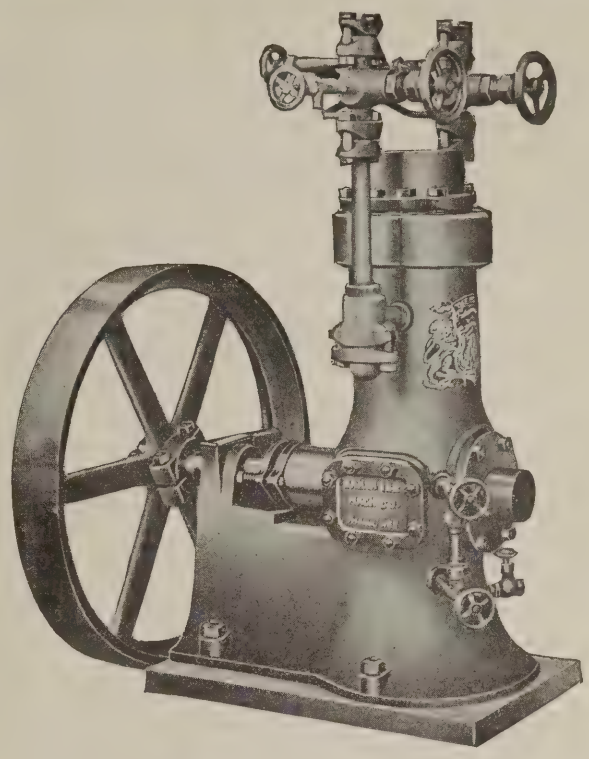
Every ice cream factory in Oklahoma is expected to send at least one man and a packer of ice cream for the scoring demonstration. Your two-gallon can of ice cream should reach Stillwater not later than December 17th. The ice cream makers in attendance will participate in the scoring on Wednesday, December 26th. R. M. Washburn of St. Paul will be one of the outside lecturers.

Course of Study.

Part 1. (For New Students.)

a. Standardization of ice cream mixes.
b. Pasteurization and emulsification of mixes.
c. Making and freezing of mixes in the ice cream laboratory.
d. Testing of milk, cream, ice cream for butterfat and solids.
e. Testing for acidity for pasteurization.
f. Scoring of ice cream.

Part II. (For Old Students).



a. Review of standardization of mixes.
b. Laboratory tests of various kinds.
c. Practical tests for gelatine, gums, improvers and flavors.
d. Tests of skimmilk powder and condensed milk.
e. Scoring of ice cream.

Attendance at the short course is not limited to Oklahoma students. Ice cream makers from anywhere are welcome to attend.

If you cannot attend personally and want to send your ice cream to be scored, you are welcome to do so.

This year's short course will be the biggest event for the ice cream industry of Oklahoma.

A. C. BAER,
Professor of Dairying.

ICE CREAM MEN ADMONISHED.

It has long been acknowledged by medical men that ice cream has value as food. Long before their acknowledgment the American consumer had appreciated the fact for himself without needing to be told by doctors or other experts as to health. Hence the rise of ice cream from the rank of a luxury to the standing of a necessity, almost.

The sale of ice cream has become virtually universal in the great cities and in the little hamlets of the entire country. Go where one will, the ice cream cone has become a ubiquitous utility. Yet the large-scale makers of this sweetly chilly necessity scarcely seem to realize that publicity is as needed and desirable for this necessary food as for any other superior product. Paul Heath of Chicago gave them a needed push when he informed the Seattle convention of the Pacific Association of Manufacturers of Ice Cream that advertising is as indispensable to their industry as to any other.

Why firms producing ice cream of superior quality should require to be thus advised appears almost unexplainable. Its varieties are limitless. If its maker desires to expand his business and make it more profitable, the need of publicity is as great for him as for any other manufacturer.—Spokane (Wash.) Spokesman Review.

Perfect Refrigeration

Means Mechanical Refrigeration — efficient, reliable and economical—The Baker System.

In the modern ice cream factory where maximum output and quality are considered—absolute control of temperatures—in the stock room—the mixing vat—the freezers—the hardening room—is essential. You have this control of even just-right temperatures with

The Baker System

Baker refrigerating engineers are at your service—they will help you solve your problems. We are justly proud of the fact that for years through the efficiency of Baker engineers and Baker mechanics fifty per cent of our installations have been made directly or indirectly through the recommendations of our customers—owners of The Baker System of Perfect Refrigeration.

DIRECT EXPANSION MILK COOLERS.

An unskilled laborer in a Chicago machine shop came to his foreman several months ago. He held in his hand a round ball. In his illiterate way he told the foreman that by using this ball for a bearing, friction of moving parts might be reduced. Thus it appears that this man had rediscovered the principal of the ball-bearing. He was totally ignorant of the fact that ball-bearings have been in use for years.

Now dairymen are not in the same class as this laborer, but they do sometimes get quite a shock when they hear of equipment which has been used successfully for years and which they could have employed to good advantage. A good illustration in point is the use of direct expansion milk coolers.

There are two general methods of cooling milk; by circulation of chilled brine; and by direct expansion. The latter is the latest development and is not so well known.

The direct expansion system, as its name implies, consists in expanding the ammonia directly into the milk cooler. This differs from the brine circulating system in which the brine in tanks, surrounds the coils containing the expanding ammonia. As the brine is cooled proper circulating machinery pumps it to the cooler. This decidedly round-about operation has several recognized weaknesses. The large brine cooling tank and the circulating machinery are expensive to install and thereafter are a constant maintenance charge. They are a useless step in the cycle of refrigeration and are a growing expense.

Direct expansion for milk coolers is not new. In the early development of the refrigerating industry it was tried out. As might be expected in a new science there were difficulties in its application. Following the line of least resistance the brine circulating system, which was easier to control, came into almost general use. The main objection to direct expansion coolers was experienced in adjusting the proper flow of ammonia to the coolers. Since the flow of the milk was constantly varying it was necessary to hand regulate the expansion of the ammonia to correspond to these changes. Usually this meant constant attention. Careless regulation resulted in freezing the milk to the cooler and permitted liquid refrigerant to pass to the compressor. These difficulties seemed insurmountable and therefore resulted in general abandonment of the system.

But the principle of direct expansion coolers was right. Engineers agreed that the brine tank, the extra piping, the circulating machinery and the constant care, played no necessary part in the refrigerating operation. For years the efforts of these engineers were directed towards solving this problem. Foremost in their activity the Refrigerating Specialties Co., of Chicago, carried on extensive experiments which finally resulted in the development of the Monogram "Type A1" ammonia pressure regulator.

This regulator properly proportions the expansion of the refrigerant in the cooler in proper ratio to the work to be accomplished. When the milk runs freely more ammonia is expanded. When it runs slowly the amount is reduced. The danger of frozen milk is in this manner eliminated and the possibility of liquid refrigerant damaging the compressor is reduced to a minimum.

One large concern, manufacturing dairy products, has used these regulators for the last four years. They are standard equipment now on all their direct expansion installations. These people frankly admit that all their success with direct expansion coolers can be laid to these regulators. That is a strong endorsement, and dairymen figuring on new equipment or on overhauling their plants will do well to get in touch with the Refrigerating Specialties Co. and let their engineers figure on their requirements.

CORNER STONE LAID AT ALLENTOWN M. & G. PLANT.

The corner stone was laid on November 26th at the immense new plant of the M. & G. Ice Cream Co. of Allentown, Pa. It was less than two months before this date that the ground was broken and rapid progress is being made. The God of Elements was not very favorable as there was much unpleasantness from aloft, but it did not dampen the dauntless spirit of the men back of this enterprise and the cornerstone laying was carried to a successful conclusion with "Sunshine Ahead" as the slogan. Hundreds of school children were present and the president of the company, John G. Mealey, offered prizes for the best essays on their impressions of the affair. They were also treated to all the ice cream they could eat.

The plant will be worth a half million dollars. The excavations are complete and substantial foundations are up. Everything is solid stone and concrete in line with a structure that will be absolutely fireproof.

The laying of the cornerstone was followed by a luncheon given by President Measley at the Hotel Traylor to the directors of the company and business associates. The delicious luncheon was topped off with bricks of M. & G. ice cream.

TWO IMPORTANT FACTS

TO REMEMBER ABOUT

GUMPERT'S ICE CREAM IMPROVER

I

It is as beneficial in *aged* mixes as in fresh mixes.

2

It is not a *substitute* for natural ripening but a *supplement* to it.

S. GUMPERT & CO., *Bush Terminal*, BROOKLYN, N. Y.

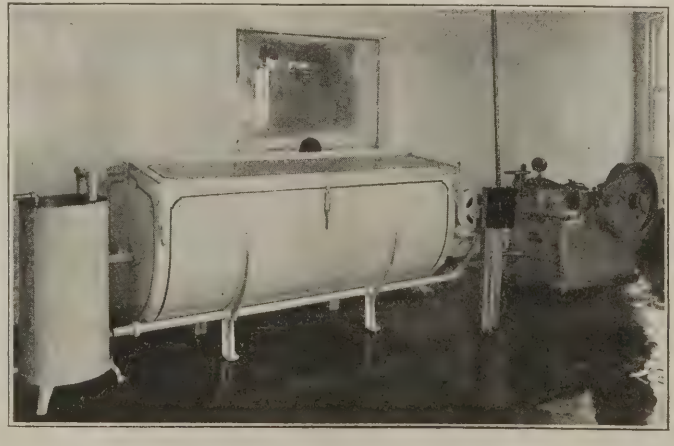
A Most Practical One-Floor Ice Cream Factory

THE Tauber Absopure Ice Cream Plant, Chicago, is one of the most unique ice cream manufacturing outlays in the country. Its completeness in every detail is quite out of the ordinary. A location of beauty, refinement and pleasant atmosphere was selected for the plant. On either side are factory buildings, the architects for which duly respected the district's wish to maintain an unusually good appearance. The Tauber plant matches the surroundings. It is a red brick building of 280 feet frontage.

The interior of the plant, its layout, its machinery and facilities express the owners' evident intention—to utilize the most advanced methods to make the highest grade ice cream that can be made. The layout of this plant was engineered and the equipment complete was supplied by the A. H. Barber Creamery Supply Company, Chicago.

Where Tauber Absopure Ice Cream Is Made.

The best evidence of the satisfaction the Barber equipment has given is the tremendous success the Tauber business has enjoyed. It has necessitated extension until the present maximum capacity of the plant's facilities have been reached. Plans for utilizing the additional 154 feet of frontage are in process of development. Not a detail was overlooked by Barber when laying out this better ice cream plant.



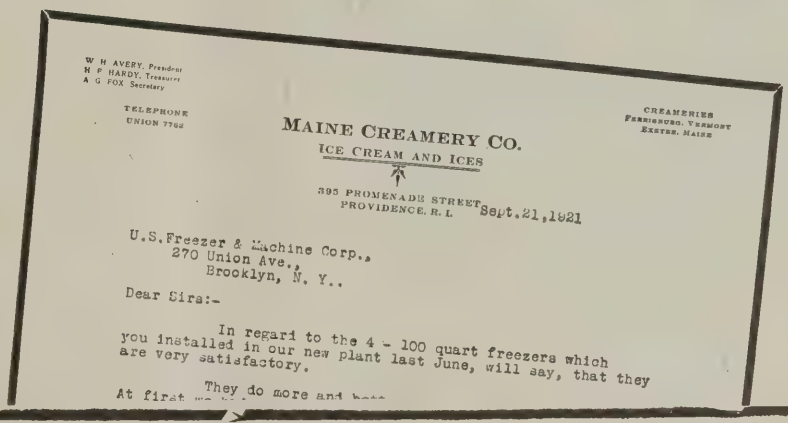
A complete laboratory, equipped with a Mojonnier testing outfit safeguards the quality of ingredients used and assures uniformity of product.

The ice cream mix is made and pasteurized in the motor driven Manning batch mixer, which, of course, gives the Tauber product the advantage of assured safety through double pasteurization.

Alongside of the Manning mixer is a No. 2 viscolizer. The mix goes in at 145 degrees Fahrenheit. A pressure of 2,000 pounds to the square inch makes the mass into a smooth, even mix and thoroughly distributes and breaks up the particles of butterfat. This process assures a creamy, smooth taste to the final product.

The mix runs by gravity over a Simplex cooler, is brought down to the normal temperature and run into Pfaudler glass lined storage tanks to age. These tanks are equipped with a motor driven agitator and brine spray jacket so that the temperature can be constantly held at a low point.

When the mix is ready to be frozen it is carried to the five U. S. freezers by a Jensen motor driven centrifugal pump. Each freezer turns out ten gallons every twelve minutes and is equipped with a Mojonnier overrun tester so that every batch is tested for weight before being sent to the hardening room.



No waste, either of time or material is permitted in the Tauber plant. Credit must be given the A. H. Barber Creamery Supply Company for prescribing a process of manufacture as smooth as the product itself. Nothing is handled twice and everything is on one floor. The usual waste in cutting the ice cream into bricks is eliminated. A special cutting table that "saves the pieces" is used.

All piping is of tinned

The Maine Creamery Co. Says:

"They Are Very Satisfactory"

After installing one U. S. Heavy Duty Ajax (100 Quart Size) Freezer, this Company ordered three more. The four freezer installation shown below was made possible only by the very satisfactory service rendered by the first U. S. Heavy Duty Freezer these people installed and thoroughly tried out in actual use in their plant before ordering the other three. Recently they wrote us as follows:

People who imagine that because order is Heaven's first law it gives them a right to order their earthly neighbors around, are as badly mistaken as though they had taken a drink of water with the idea that there was gin in the glass.

ICE CREAM SALESMEN STRENGTHEN NATIONAL CLUB.

Aside from the actual exhibition of ice cream machinery, services, equipment and supplies held in Buffalo by The Association of Ice Cream Supply Men the Week of October 31st, the greatest interest among representatives of the industry was in the annual business meeting of the Salesmen's Club, an auxiliary to The Association of Ice Cream Supply Men.

This club has approximately 500 members traveling the country from coast to coast and calling on practically every ice cream man in the country. The following directors for the ensuing year were elected: R. J. Decy, J. E. Graham, W. E. Gray, Jr., G. R. Kleinau, S. W. Mendelsen, P. N. Miller, J. B. Morse, A. A. Senor, Thos. J. Stewart. The new directors subsequently elected Thos. J. Stewart of Milligan & Higgins, president; W. E. Gray, Jr., Elyria Enameled Products Co., vice president, and A. A. Senor of the National Paint and Varnish Co., treasurer. President Stewart later announced the appointment of Jay Kugler of the Western Confectioner; J. W. Mulligan, of Rex Extract Co.; E. K. Slater, of The Ice Cream Review, and J. E. Simpson, of the Elyria Enameled Products Co., as regional field representatives for, respectively, the Pacific, south, the west central states and the east central states.

The Association of Ice Cream Supply Men announced the awarding of four prizes to salesmen with the most creditable records of work well done for the Salesmen's Club and the expansion of the ice cream industry in the preceding twelve months. The winners of the awards are: C. J. Yuncker, of the Rex Extract Co.; J. W. Mulligan, of the Rex Extract Co.; A. A. Senor, of the National Paint & Varnish Co., and S. W. Mendelsen, of The Daigger Corporation.

FRIENDS HONOR R. J. DECY.

Led by Albert McDougall of the Allman Gas Engine and Machine Co., twenty-four friends of R. J. Decy, retiring president of the Salesmen's Club of The Association of Ice Cream Supply Men, gave a surprise dinner to Mr. Decy in the Hotel Lafayette in Buffalo, Saturday evening, October 30th. O. S. Jordan, president of The Association of Ice Cream Supply Men; Dr. Wilbur Wright, president of the Sealright Co.; H. M. Colman, of the Essex Gelatine Co.; Andrew Thompson, of the Emery Thompson Machine and Supply Co.; B. B. Scott, H. W. Stern, of the Daigger Corporation; John H. Mulholland, of the John H. Mulholland Co.; Howard W. Black, of the Widlar Co., and F. E. Hollweg, of Thos. W. Dunn Co., were among the fifteen or more persons offering toatsts to the surprised guest of honor.

NEW ORLEANS, U. S. A.

Ice Cream Men of West Virginia Held Big Convention

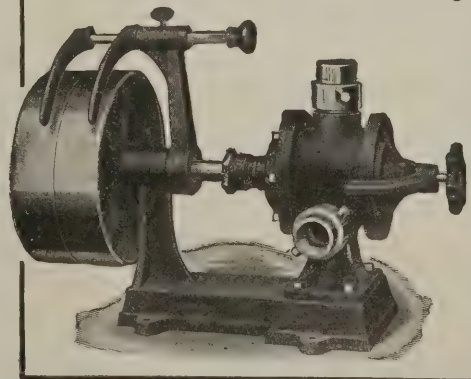
THE Ice Cream Manufacturers of the State of West Virginia picked a cold day for their convention, but the affair was a huge success, it being one of the largest ever held by the ice cream manufacturers of that state. On Nov. 21st, 125 delegates had registered at the Twelfth Annual Convention held at the Windsor Hotel. All cities in West Virginia and cities of Eastern Ohio and Western Pennsylvania were represented. Registration was made during the morning by Secretary C. F. Jamison of Huntington, W. Va., and the afternoon was devoted to a business session, marked by several good addresses. At 5:30 a big banquet was served at Morgan's Inn, near West Alexander.

President W. M. B. Sine of Clarksburg, opened the program at the first day's session, and his address was well received. He spoke of the methods being used by the ice cream manufacturers in meeting post-war conditions and of the prospect for the future. Better and bigger business is in sight for all kinds of business, he declared.

Then followed the reports of the secretary and the members of the board of directors.

Secretary C. F. Jamison, of Huntington, W. Va., made the report of what had been accomplished during the past year. He spoke of the ice cream consumption having tripled in the past ten years in the state of West Virginia, and he declared that people now realize its food value. "Ice cream has become such an indispensable food that few, if any, do without 'a dish a day.' It is interesting to note," he stated, "the fine effect ice cream has upon the human body. Ice cream, the kind made now-a-days, is one of the real essential nourishments to be had upon the market of health. I find that the ice cream consumption in the territory of the John's Company" (Mr. Jamison is with the John's Ice Cream Co. of Huntington) "is about as large as that of bread. Children prefer ice cream, the real wholesome kind, to other kinds of food. It is human nature for them to continue to eat it when they grow older. From early infancy people learn that ice cream is really indispensable."

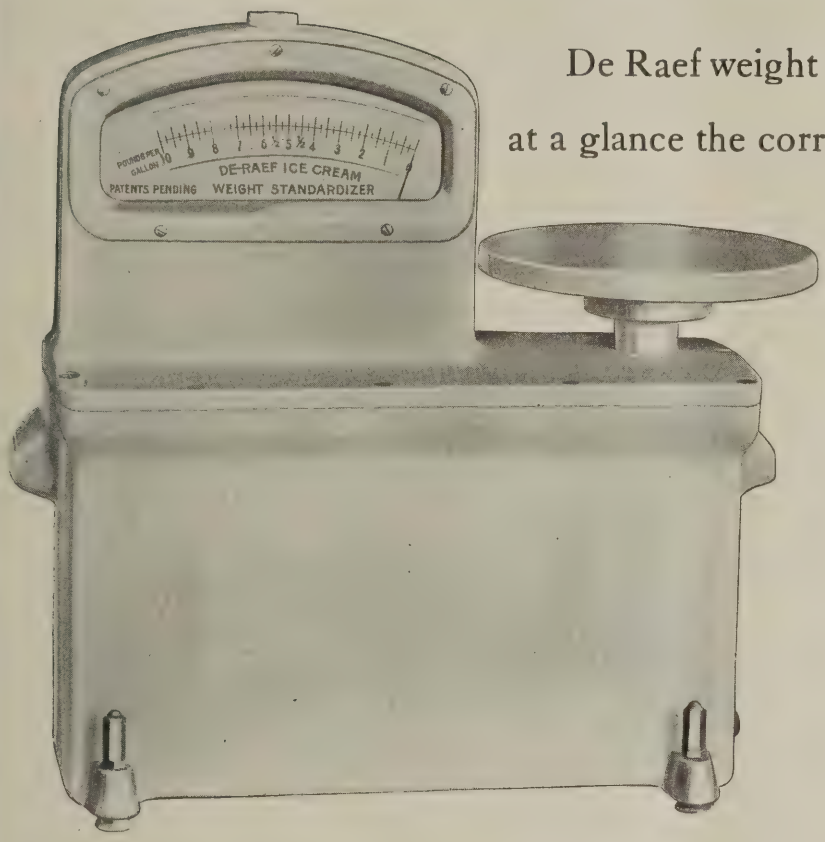
The first formal speaker introduced was Roy B. Naylor of Wheeling. His topic was, "These Are Not Hard Times, But the Passing of Soft Times." Mr. H. C. Ogden, also of Wheeling, spoke on the subject of "Why the Gross Sales Tax Should Be Repealed," speaking of the unfairness and inequalities of the measure passed recently by the state legislature as being detrimental to business conditions. H. G. Bradley, of Bluefield, manager of the Husband's Dairy Company, chose as his subject, "Increasing the Per Capita Consumption of Ice Cream in West Virginia." He pointed out three of the biggest items for increasing the per capita consumption —advertising, reduced prices and forcing the distributors to accept less profit. His address was one of the big successes of the day.



An open forum session was held and many of the delegates participated.

The program for the second day of the convention was equally interesting and successful. Speeches were made by J. H. Schindler of Telling-Belle-Vernon Co. of Cleveland, Ohio; J. T. McCann of the Imperial Ice Cream Co., of Wheeling, W. Va.; S. B. Haffner of Elkins Storage and Provision Co., Elkins, W. Va.; and O. S. Jordan, president of the Association of Ice Cream Supply Men of New York handled the subject of "A Square Deal" very well; and the speeches were very well received.

S. B. Haffner, vice-president of the association, in his address on the retail price of ice cream, said: "The retail price of ice cream when sold in sundaes, ice cream sodas, etc., is too high. The retailers, in many instances, have not reduced the price of ice cream served in confectioneries despite the fact that the wholesale pric has come down. To my mind it is unreasonable to ask a person to pay 15 or 20 cents for a little ice cream with a bit of syrup poured over it. The other day my daughter told me she paid 18 cents for an ice cream soda, and she added that she didn't intend buying any more until the price came down. When members of your own family will not buy your product because it is too high in price, it is certainly an indication that the general public feels the same way about it. A few years ago, confectioners were serving nearly twice as much ice cream in sodas as they are serving now, and they received ten cents for them." It was also suggested that an educational campaign should be instituted among retailers on the question of serving ice cream, some members holding the opinion that the confectioners are not making an undue profit from the sale of ice cream as at present dispensed.



C. A. Lutz, of the Look Creek Bottling Co., of MacDonald, W. Va., who deals mostly with residents of the coal fields of the southern end of the state, says, "As much ice cream is consumed in the coal fields as in the thickly populated cities as compared with the numbers. I have found that the sale of ice cream in the company

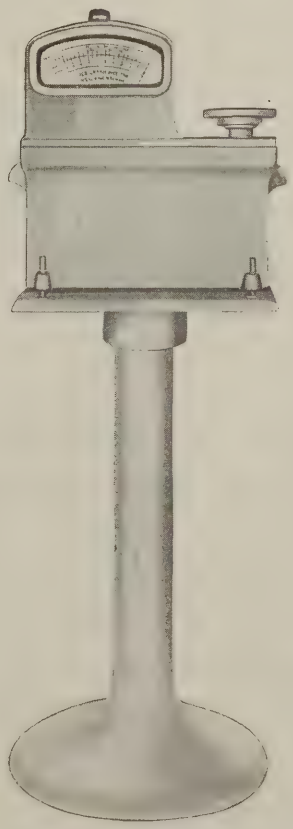
Standardization of Ice Cream

By Weight Per Unit Volume



De Raef weight standardizer tells you at a glance the correct weight per gallon, while the ice cream is still in the freezer, giving the ice cream maker full control of a standard weight per gallon as well as a given over-run.

No weights—no charts—no counter balances—no telescopic cups — no adjustments — no magnifying glass to read dial—no figuring—always ready for operator—water proof and rust proof.

Works automatically—reading can be made ten feet away—large black figures on white dial. Will give correct weight per gallon of ice cream, regardless of weight per gallon of mix.

De Raef Ice Cream Weight Standardizer circular sent on application to the Ice Cream Department

N. A. KENNEDY SUPPLY COMPANY
KANSAS CITY MISSOURI

stores of the coal fields is just as large as in soda parlors in the cities."

Open forum session was again held, followed by the election of officers for the coming year. The officers elected are as follows: W. M. B. Sine, Charleston, W. Va., president; S. B. Haffner, Elkins, W. Va., vice president; C. F. Jamison, Huntington, W. Va., secretary-treasurer. Directors—W. M. B. Sine, Charleston, W. Va.; H. G. Bradley, Bluefield, W. Va.; D. P. Wickline, Mullens, W. Va.; S. B. Haffner, Elkins, W. Va.; G. W. Shettler, Wheeling, W. Va.; J. H. Cline, Charleston, W. Va.; F. A. Hummell, MacDonald, W. Va.

KENTUCKY WANTS NATIONAL DAIRY SHOW.

Editor, The Ice Cream Review:

Lexington, Ky.

There is a feeling that the next National Dairy Show should be held in the South, for the South needs the stimulus that this exposition brings to any community where it is held. We people of Kentucky feel that Louisville is the logical place for it. The state fair grounds have ample facilities for housing it now, since the big exposition building has been built. This building is as big as the building used at St. Paul. The floor space and the balcony will take care of the exhibits of dairy supply houses and of an educational character. The livestock ampitheatre is one of the largest and best in the United States. All this equipment, together with the barns, have been offered by the State Fair Board.

Louisville is easily accessible to the entire South, and it is easily reached from points in the North also. It seems that the horse show has not been a grand success at past Nationals. Louisville will show visitors what a real horse show is, and also it will show what a valuable financial adjunct the horse show can be made to the National Dairy Show.

The National has been held in the far east (Massachusetts) the central north (Chicago and Columbus), and the northwest (St. Paul). The South needs this show, and it is the purpose of the people here to make a substantial offer for it for next October. Dairy supply houses and manufacturers of dairy equipment will appreciate the importance of exhibiting their wares to Southern people, for this section is fast expanding as a dairy center. New creameries, milk depots and ice cream factories are being erected in all parts of the South. Louisville is the place where Northern thrift meets Southern hospitality. It is desired that all who will aid in this effort should lend their influence now.

J. J. HOOPER,

Professor of Animal Husbandry in charge, Dairying.

ANNUAL CONVENTION AND DAIRY SHOW OF MICHIGAN ALLIED DAIRY ASSOCIATION, SAGINAW, FEB. 14-17, 1922.

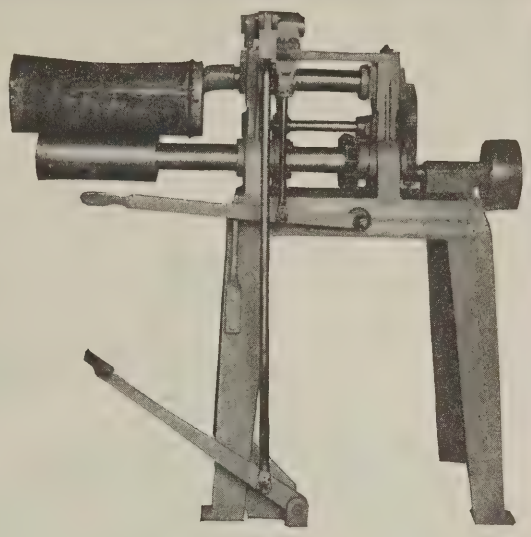
Affiliations. The Michigan Allied Dairy Association numbers among its affiliations all branches of the dairy industry in Michigan. Itemized they are: (1) creamery butter manufactures, (2) cheese manufacturers, (3) condensed milk and milk powder manufacturers, (4) market milk distributors, (5) ice cream manufacturers, (6) producers, represented by the Michigan Milk Producers Association and the state farm bureau, and (7) dairy machinery, equipment and supply firms, represented by the Michigan "Dairy Boosters" Association.

Annual Convention. At the annual meeting and convention of the association a general program is carried out, and in addition there are sectional meetings of the several affiliated units of the organization. The cream of available material will be obtained for the several unit programs, with special head-liners for the general program.

Convention Exhibits. Educational exhibits of the state, the U. S. department of agriculture and of the Michigan Agricultural college will be featured. A complete line of commercial dairy machinery, equipment and supplies will also be shown, using the Saginaw municipal auditorium, which building is ideally suited for a joint convention and show such as is being planned.

Attendance Expected. A special "drive" has been planned designed to build up a large attendance of both producers and manufacturers of milk and milk products in Michigan. In this connection the association will have the active cooperation of the state farm bureau, working through the county agents in each county. Agencies, only indirectly interested in the industry, such as the railroads, have also come forward with substantial offers to assist in giving publicity, and urging the value of the convention and show.

Cooperation the Word. The prevailing industrial depression, especially as it affects the value of farm crops, has again proven the stability of the dairy industry, and the need for the further building of this most important branch of agriculture, is therefore emphasized. This can only be accomplished through the combined effort and cooperation of all interested.



HEADQUARTERS ESTABLISHED.

The World's Dairy Congress Association has established headquarters at 426 Star Building, Eleventh and Pennsylvania Avenue, Washington, D. C., where H. E. Norman, President, will welcome callers and communications from any who are interested in plans for the coming Congress.

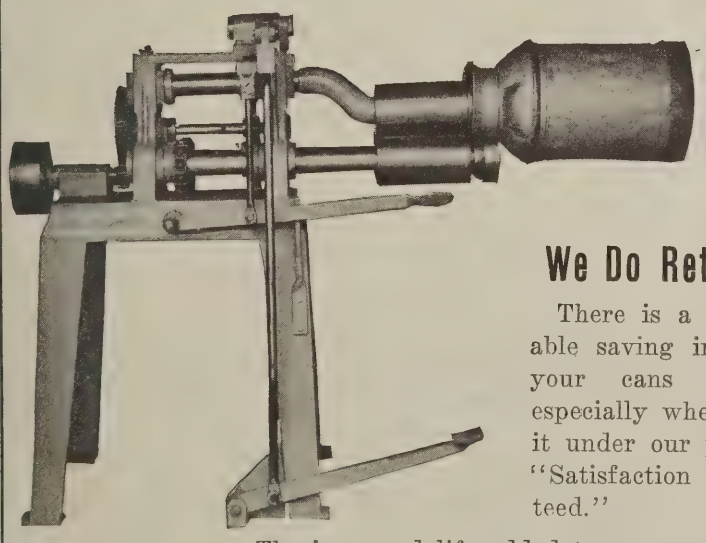
IT "IRONS OUT" THE WRINKLES

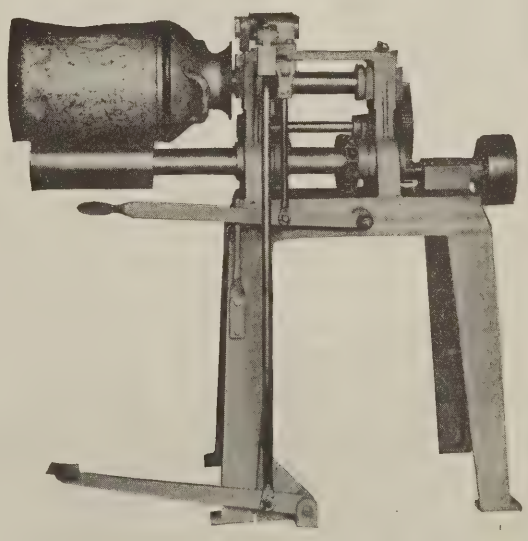
JUST like a flat iron smooths out the wrinkles in the laundry, so will the Wacho Can Straightener remove the dents in your cans. Just as simple to operate as any mechanical household ironing machine. Just as efficient.

The Wacho Can Straightener removes dents from body, neck and cover—quickly—noiselessly—does it in your own plant and at a very insignificant cost per can.

Write for circular and whether interested in a demonstration.



"WACHO" Can Straightener



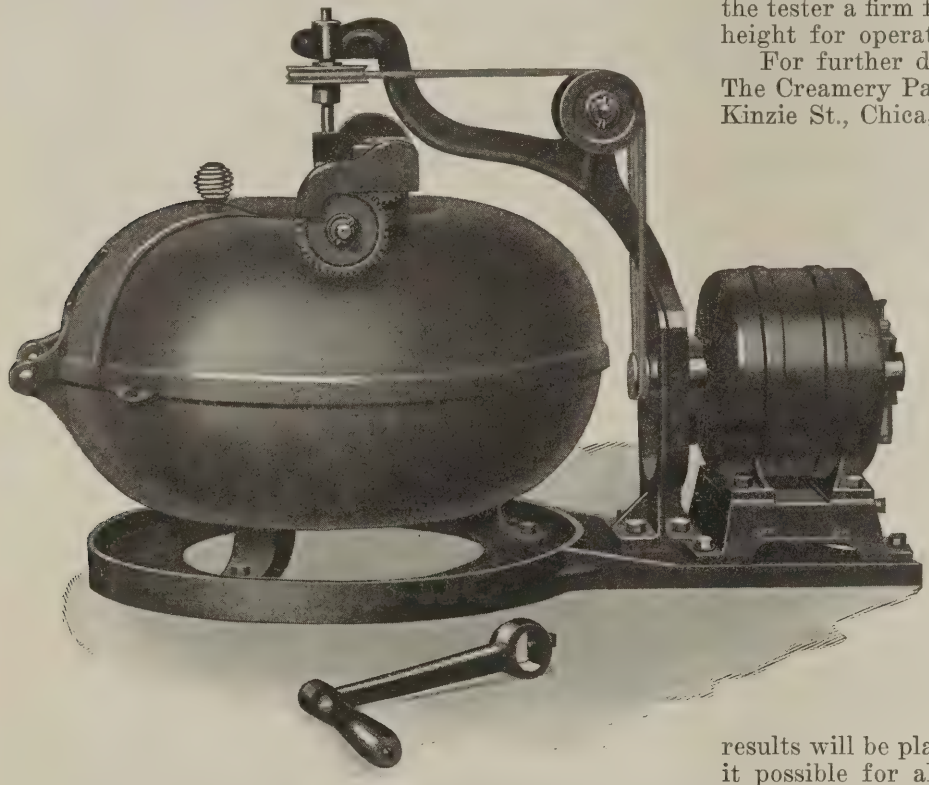
Puts a new complexion on your cans that indicates "full capacity" — the quantity you pay for. Getting all you pay for is a sure way of increasing your profits.

Manitowoc Plating Works

Manufacturer "Wacho" Can Straightening Machine
Rebuilding, Retinning and Manufacturing of Ice Cream Cans, Milk Cans and Special Dairy Supplies.
Years of Satisfactory Tinning Service to the Dairy Trade.

MANITOWOC **WISCONSIN**

We Do Retinning



There is a considerable saving in having your cans retinned, especially when we do it under our policy of "Satisfaction Guaranteed."

The increased life added to your cans when retinned the Manitowoc way, many times offsets the cost of retinning.

Let us tell you more about our retinning service and give you an estimate on the number of cans you have to be retinned.

A NEW MOTOR DRIVEN BABCOCK TESTER.

The manufacturers of the Crepaco motor driven Babcock tester claim this machine is an improvement in many ways over other motor driven testers. Its particular advantage is that it has an adjustable speed arrangement which enables the operator to start slowly and then gradually increase the speed until the desired revolution per minute is attained, thus avoiding the breakage of bottles and loss of material.

The New Electric Motor Driven Crepaco Babcock Tester Showing Adjustable Speed Arrangement.

Another feature of the Crepaco is that both the tester proper and the motor are mounted on the same base, thus avoiding vibration and insuring constant alignment.

This machine is supplied in two types, i. e., type No. 1 electric motor drive only and type No. 2, combination hand and electric power drive. The latter type was designed for use when intended to be driven chiefly by electric power, but it can also be operated by hand power when so desired. When it is desired to drive this machine by electric motor, all of the hand driving mechanism may be completely thrown out of gear by the loosening of a single hand screw. When desired to be changed back to hand power drive, it is just as easily replaced in gear.

The tester proper is the regular type C Crepaco Babcock tester and is supplied in either 8, 12 or 24 bottle for 6 inch bottle sizes. All gears in this tester are encased and at the top of machine. They are milled in special milling machines, are absolutely accurate and therefore practically noiseless. The outfit can be obtained with or without glassware as desired.

When desired the outfit is furnished with a three-legged tester stand which is very convenient as it gives the tester a firm foundation and raises it to a convenient height for operation.

For further details our readers are invited to write The Creamery Package Manufacturing Company, 61 W. Kinzie St., Chicago, who are manufacturing this outfit.

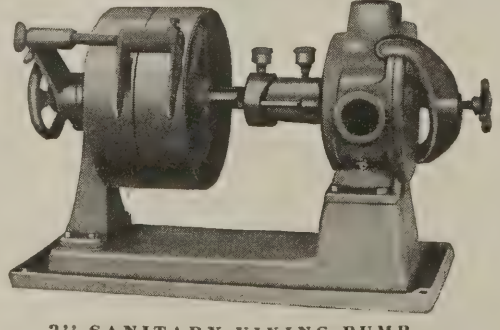
CALIFORNIA ICE CREAM SCORING CONTEST.

At Stockton this year, in conjunction with the Pacific Slope Dairy Products Show, there will be an exhibit of ice cream from manufacturers to compete for complimentary medals to be awarded by the show.

These entries will all be scored, using the newly approved score card of the University of California. The judging will be under the direction of the Pacific Slope airy Products Show. The construction of the score card used, makes it possible to exhibit so-called "Standard" ice cream.

Each exhibit will be placed in a cabinet which will contain the entry number. A score card with the final results will be placed above each exhibit. This will make it possible for all manufacturers to examine each exhibit and make comparisons with the score.

The educational value of this program is without a doubt the most valuable thing which has been undertaken for improving and standardizing the quality of ice cream.



Please refer to my letter of recent date for further instructions as to entries.

SERVICE—NOT JUST EQUIPMENT

Here are a few of the Elyria Glass Enameled Steel Tanks which help reduce costs and increase efficiency in the French Brothers Bauer Company Plant.

Why Did French Brothers Bauer Install Twenty-five Elyria Tanks?

COMPLETE endorsement of Elyria Glass Enameled Steel Equipment by French Brothers Bauer Company of Cincinnati is proof of its superior merit. Twenty-five tanks—ranging in size from 500-gallons to 2000-gallons capacity—increase efficiency, lower costs and simplify operations in the handling of Milk, Ice Cream and Dairy Products. Typical of every other installation—the Elyria Tanks in the French Brothers Bauer Company Plant were installed with the definite, proven idea of reducing cost and increasing plant capacity. That they have done so in this case, and that they can effect similiar economies in your plant, can be demonstrated to you after an inspection of your operations has been made.

Facts

Elyria Tanks are easy to clean and keep clean; Elyria Glass Enamel will not crack or chip: it neither gives flavor to the product or takes flavor unto itself; it has no crevices where germs may gather; it permits of no leakage or contamination.

A detailed plan of operations used by French Brothers Bauer and a complete description of Elyria Tanks will be sent upon receipt of your request. Write for Elyria proof now.

ELYRIA GLASS ENAMELED STEEL EQUIPMENT

Inspection — Is It Worth While

By H. LEE KOENIG, Assistant Manager in Charge of Inspection, John Wood Manufacturing Co., Conshohocken, Pa.

We have up to about nine months ago been in a period of feverish industrial activity, a period when the demand for manufactured products greatly exceeded the supply and most anything that was produced could be disposed of without question. As it invariably happens when a great demand exists, the buying public were not prone to be as discriminating as to quality as they might have been, and consequently a large number of manufacturers marketed their product successfully with no apparent opposition from the purchaser. There was then a large supply of orders and a dearth of manufacturers, so practically anything that functioned at all got by,

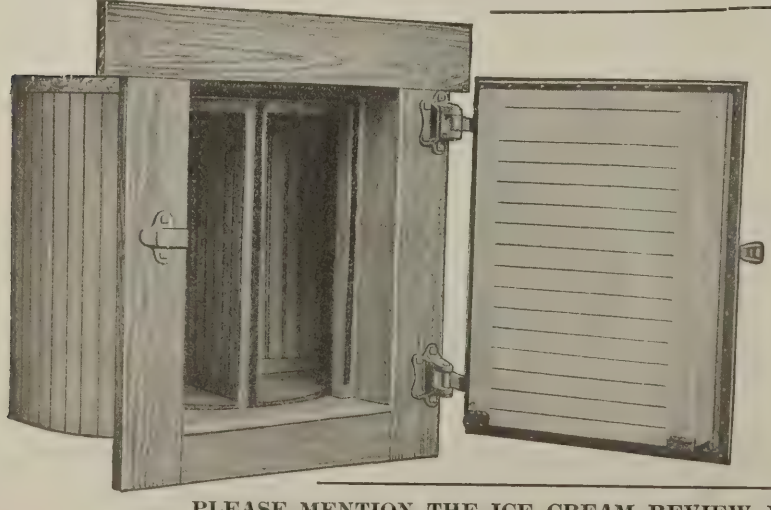
H. LEE KOENIG

Conditions are now exactly opposite and there are four or five manufacturers to every order. You can purchase your requirements anywhere, any time from four or five different sources of supply. Expressed in a few words, we have a "buyer's market" with all that that conveys to the manufacturer—a discriminating, critical and hard to please public made so by this complete reversal of conditions.

What must we do to meet this changed order of affairs is the almost universal cry of the man who desires to keep his plant running at least part of the time and who is greatly troubled by the increasing demands of his customers as to quality and their incessant criticism of his manufactured product.

Let us examine this question a little before we proceed and see if we can find out why these customers are more critical than usual and why goods that suited them once will not suit them again. Is it because the product itself is not right or is it the usual come back of the man who either does not care to buy or who desires to push his advantage?

Now it may be the latter reason in a few cases, but in a vast majority of instances, it is solely because the good times in the past made so by an almost inexhaustible demand, eliminated many a just criticism. A great many manufacturers boldly marketed their products, knowing that they contained defects that were not removed simply because there was no great demand for their removel. The customer was only too glad to get what we ordered, be it what it may. Old and tried manufacturers following the lines of least resistance, allowed their products to dwindle in efficiency. Old time standards were lowered or done away with altogether; all barriers being removed before the ever increasing cry of production which almost entirely drowned the faint protest of the buying public. It was during this stage that the word "efficiency," as applied to manufactured articles lost almost its entire significance.



Now who was to blame? Was it the manufacturer entirely or was he just simply a victim of circumstances he could not control? Remember, in business circles it was a far greater crime to throw a customer down entirely in not delivering his order than it was to send him something which, by reason of lack of time, was not quite as good as it should be.

A great many manufacturers chose the lesser of the two evils and owing to the great pressure exerted by the buying public, sent from their plants merchandise far below its normal standard.

Then there were other circumstances which tended to lower this standard. Labor, restless under high wage and unusual working conditions constantly moved from plant to plant wherever the highest wage prevailed. New and sometimes very inefficient men had to be employed to fill their places, so this immense labor "turnover" simply added to the difficulties of manufacture.

Not only was labor constantly on the move, but where it did stop it was very poor material. Much has been written on this phase of the subject alone, and yet the half has only been told. We need simply to mention it. All that we are interested in at present is how the various manufacturers in this country are endeavoring to "come back" to pre-war efficiency, not particularly with the causes which led to the poor quality of their product. The fact remains that they must now, in order to meet this extremely competitive market, manufacture merchandise that possesses the requirements which fulfill these changed conditions.

An inspection system of some kind which will effect-

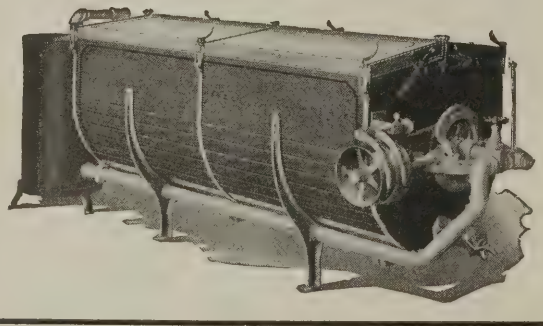
What Factor Decides You To Buy?

You don't buy a Batch Mixer merely because you like the color it's painted. Even the price, although of great importance, should not be the deciding factor.



What you want is service, and service for the most part depends upon raw materials and workmanship.

It is our honest belief that the Manning Batch Mixer is the most carefully built vat on the market today. The raw materials used are the best we can buy.

The first cost — low as it is — is practically the last.

MANNING MANUFACTURING COMPANY

Ruthland, Vermont U. S. A.

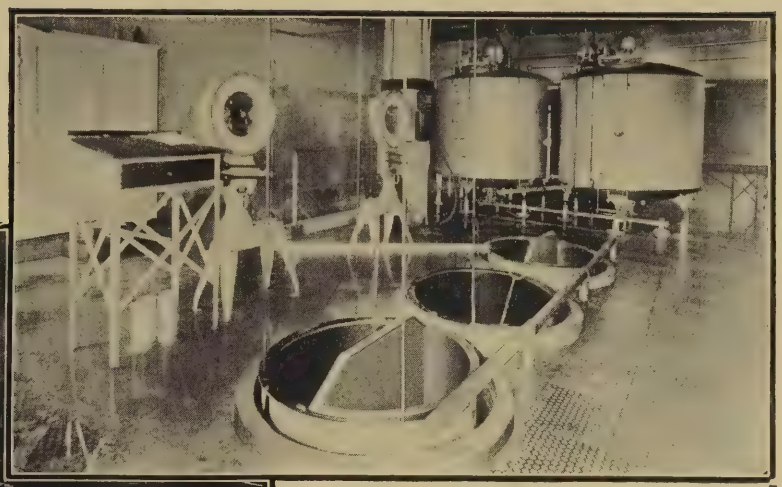
Perfect in Workmanship

ually separate the wheat from the chaff is absolutely necessary in all manufacturing institutions. There must be lines drawn and standards raised in order that not only the customer be protected but the plant put in a position to market their product effectively and economically.

A well known manufacturer who for years had been an ardent supporter of this policy stated that in his plant inspection must first, protect the customer by withholding anything from him not of the highest quality; second, that it must protect the plant, for business will not continue to come to an organization which permits faulty work to slide through, and last, that it is the duty of inspection to investigate and correct those defects which render the work unfit to pass and thus eliminate as much as possible the scrap heap and its attendant loss.

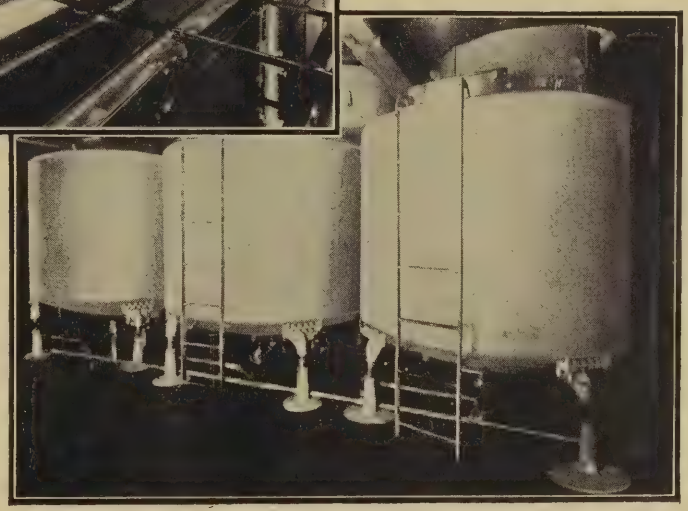
If these three duties are the proper function of inspection what then should be the attitude of the executives and the employees toward a system of this kind, for one can readily see that the decisions rendered, are far reaching and come in close contact with practically every department.

Concerning the attitude of the executives, little need be said. If they originate the department they must believe in it, and believing in it they must consistently back it. The common mistake is to pit inspection against production, with a view of obtaining the best out of each department and possibly a middle course which is half way between big volume and poor quality and small volume and high quality. The fallacy of this is two fold, first, there is absolutely no reason why big volume and high quality should not go together, and second because a lack of team work will ruin any enterprise, be its organization what it may.



Production and inspection must work hand in hand, their purposes are one and the same. Perhaps one does lean a little more to the efficiency of the product, while the other leans more to volume, but where volume and efficiency run together there will be found the highest type of industrial organization.

The attitude of the men toward the inspection Department is largely the attitude of the executive heads. Let the foreman take kindly to having their work supervised and the men will absorb the idea readily. It the co-operation of the men is obtained, the success of the department is assured without question.



The writer wants to state here that very few plants were entirely without some inspection organization, but we do believe that practically none of them had this department remain steady under the terrific production period that we passed through last year. Practically all organizations of this kind broke under the heavy pressure and now these must be rebuilt again and the barriers made strong enough to withstand.

Let us get back to the old standards of efficiency, if necessary, re-establish our old specifications both on our raw materials and our finished product. Refuse to accept defective and unreliable merchandise in the shape of raw materials for the production of our commodities and we will stand a much better chance of turning out good work ourselves. Let everybody start striving for the best and the best will come,—it is inevitable.

Some times it has been stated that inspection hampers production, that it impedes progress and raises costs, but the biggest successes in the manufacturing world would not so express themselves. Picture to yourself the production of the Ford car under any other system than that of rigid inspection of component part. Make these component parts right, so that each and every one will properly fit and the entire as-

The Crescent Creamery Co., Los Angeles, has standardized on Pfaudler Equipment. In 1916 they installed the three storage tanks shown in the lower view. Since then increased capacity has led them to equip with the storage and weight tanks shown in the upper views. The illustrations do not include the Pfaudler buttermilk tanks and pasteurizers also at this plant.

Equipping Throughout!

There is a growing tendency among dairy and ice cream companies, building new plants to specify Pfaudler Equipment **throughout** — or plants increasing their capacities, to **add** Pfaudler units.

Our tanks are equipped with many labor-saving devices, which make them easy to operate. Men naturally prefer this type of equipment.

When we lay out a plant for you, there is minimum amount of sanitary piping used,—the tanks are placed at convenient points easily accessible to save footsteps, and unnecessary handling. Advance planning is done for possible future increase in business, so that the installation of new equipment will not involve undue tearing up of your plant. There are other ways in which we can save you money and inconvenience in such layout work.

Write us for details. There is no obligation.

"If Made from Canvas We Make It"

WEST SALEM OHIO

sembly will be complete and rapid. The only way to get this efficiency is to set up a standard, work to it, eliminating by a process of rejection, those parts which do not measure up.

It has been the experience of the writer, that the only condition under which costs were raised was where inspection was first installed in plants which heretofore had had no supervision of this kind. In one particular instance the costs did go up on account of rejection of defective material but only for the length of time it took the plant to really produce an efficient article. When that was done, the volume became so heavy that costs of production took quite a downward slide until finally at the finish of five months they were about half as much as at the beginning. It is far easier and really cheaper to make things right than to make them wrong when once you get the big idea.

Let us assume that we are installing a system of this kind in a plant which heretofore had no organization of this nature, and naturally the first thing to do would be to acquaint the foreman and men with the idea, how it works and what it means in final reduced costs and efficiency. Much depends upon how well this idea is "put across" for the initial steps of inspection are strewn with many a stumbling block, and the more the ground work is fully covered in this respect, the faster will be the progress of the department.

We must then establish our standards of efficiency, for if we are going to work to something we must have a fixed and definite idea of just what that something is. These standards will generally take the form of specifications, first as to finished and semi-finished products and raw materials. If our commodities are of such nature that tests must be applied in order to demonstrate their efficiency, the specifications of these tests must be thoroughly gone into and tabulated. After all these preliminaries are accomplished and we have a fixed and definite idea of just what we are going after, we should take a few steps in that general direction.

Partial View of Southern Exhibition of Association of Ice Cream Supply Men, Atlanta, Georgia, November 28-December 2.

A few men should be chosen from the list of the workmen, say one in each department, who will have supervision over the quality of the work, not how fast it is turned out, that is the foreman's particular job, but how good it is when finally produced.

We want to say right here that it is generally better to pick men to start with from among the plant employees themselves, than to go outside for them, first, because they are generally more familiar with the product being manufactured, and second, because the department being somewhat of an innovation, these men will probably fit in better with the shop organization. After the inspection department is fully organized and functioning efficiently, this procedure need not be so

closely followed and new men from the outside can very well be employed.

There is another situation which will loom up next and which, in our opinion, is most vital and that is the quality of the first inspection. Very often this determines the initial success or failure of the whole scheme.

Although the writer is a close inherent of the principle of "hewing to the line, letting the chips fall where they will," he does not recommend this position at the initial installation of a competent inspection system in a plant which heretofore was entirely without an organization of this kind.

It will be found that a wholesale rejection at the beginning will do more to discourage the men and even more so the executive organization than anything that could happen and it all may simmer down to the old plan of manufacturing as heretofore without inspection.

It is impossible to raise the standard of a plant in a day and while the specifications and ideals we work to should be of the highest order, their interpretation at first should be exceedingly liberal.

In one plant which fell under the writer's observation, after six months of inspection, the rejections were only 10 per cent of what they were at the beginning and still the inspectors were rejecting at the expiration of that time, the same class of workmanship they were formerly accepting, so much had the standards of efficiency been raised. When this method is tried out even half way efficiently, the results are far more effective than when the lines are drawn so closely at the beginning.

After a certain period of time depending on circumstances and conditions the inspection can be gradually increased from simply an inspection of the finished article, to an inspection of component parts, then gradually extend to the raw materials, as these really are the fundamental basis of all manufacture. If these are not right, it is useless to try and make the product right. It is difficult to give hard and fast rules for the growth of an organization of this kind on account of so many conditions affecting the situation, but one principle above all others must be followed and that is, "make haste slowly."

We repeat, nothing is so disturbing to the peace and serenity of a manufacturing establishment than the wholesale rejection of their manufactured product at the initial installation of an inspection department. If the product heretofore had functioned at all, even though the need of an increased efficiency is absolutely necessary, raise the standards slowly and this only can be done by a most liberal interpretation of the specifications.

Full reports of all inspection are necessary not only to fully acquaint the management with all the details of the work, but to afford a basis of comparison of efficiency of different time periods. It is not necessary in this article to go into the form of these reports as these will vary in every plant in which the principle is applied. It may be in a later article the writer will go into this more fully. All that need be said here, is that they must correctly tabulate every defect, the total number of articles inspected, the percentage rejection of every defect and the percentage rejection of the whole. A close study can thus be made of the causes of these defects, why they exist and remedies suggested for their elimination.

These reports should be made out each day for every department and filed for future reference. Copies should be given to each foreman for his personal attention and when they want and ask for these, one can rest assured they have at last gotten the big idea of efficiency and co-operation.

Now one word as to the attitude of the inspectors toward the plant and their co-operation in general, for that feeling must be two sided and not all in one direction. To any executive installing an inspection system we can only say, choose well your men. They must be sincere, fair and impartial, reasonable and willing to discuss peacefully any question concerning their work and their decisions.

It is extremely wise to make this department answerable only to the general manager; it must not under any circumstances be under any production department. Avoid choosing men who are apt to have a "holier than thou" feeling, an arbitrary attitude, a disposition not in accordance with perfect plant harmony, and you will go a long way toward insuring the success of the new department.

Let me drop you a little word right here. If, my reader, you by chance should be chosen any time in your career to originate a department of this kind in a plant where the idea is a new one, let me warn you, that you will not have an easy time, your path will be rough and rocky; how rocky it is depends to a great extent on how diplomatically you attack the problem.

At first you will be eyed with suspicion and distrust, not only by the foremen but also by the men, and it is up to you to disarm this attitude. Show them plainly, that by pointing out the defects and tabulating them, you only show their prominence in relation to the whole product, not with a view of calling attention to the shop's shortcomings but with the loftier purpose of higher standards and better workmanship all around.

For A Smoother

FIRMER ICE CREAM

Fruit Frost or Water Ice

Use

Rippey's Powdered Foamoline

No Heat Required

Simply mix Rippey's Powdered Foamoline with the dry sugar add your cream or milk and it is ready for the freezer.

Send for a trial package and book of formulas.

For a limited time we will send postpaid a full half pound package on receipt of 25c, together with our formulas for making ice creams, sherbets, etc.

Rippey's Powdered Foamoline is packed in one pound boxes with registered trade-mark and signature of William Rippey on every box. Never sold in bulk.

Wm. Rippey 101 E. Second St. Cincinnati, Ohio

This is your worst battle and if you win it successfully your path from then on will be much easier. In one plant which fell under the writer's notice this was the main point of issue, but when the men were convinced that the attack was on the work and not on them, there was comparative smooth sailing. Co-operation is the keynote of this system, as well as it is of all systems, and co-operation must exist in order to insure its success.

In conclusion, and the writer feels that he has barely skimmed the subject, we have only to look at some of our great and growing industries who have adopted this plan to the fullest extent in order to answer our question as to whether inspection pays. It not only pays, but it is absolutely necessary for the preservation of any industrial enterprise, and even more so now than ever before. Sooner or later if bad work continues to go out, the products of other competitive plants will supercede those of the old established firms who feel that they are making a product which is good enough to get by with.

Let us endeavor, therefore, in order to meet this competitive market, these changed conditions, to originate a system of close supervision over our manufactured products, so that the firm we represent may sail through successfully these stormy seas of business and financial perplexity and live to enjoy the "good times" which we fully believe are in store for us all in the near future.

LADD'S NEW CATALOG.

The John W. Ladd Company, Detroit, Mich., have sent out letters to their customers in which they say: "We are very much pleased to send you herewith our new catalog showing a complete line of machinery, equipment and supplies for all branches of the dairy industry. Our desire is that you use this catalog as a text-book, in solving your problems, and if any questions arise which the information given in our catalog does not answer, write to us promptly.

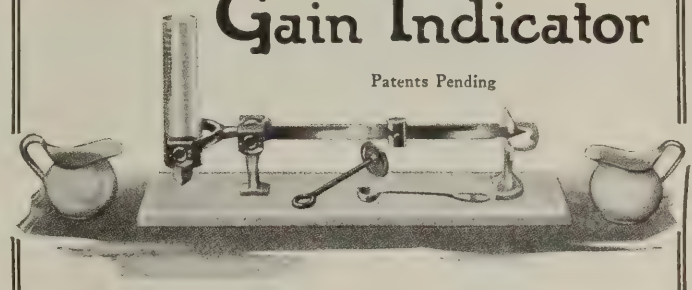
"Since this catalog is part of the service which we wish to render you, use us both freely.

"Appreciating any and all of your favors, whether large or small, and assuring you that the smallest order will receive our very best and most prompt attention, we remain, Yours very truly,

JOHN W. LADD COMPANY."

Along with this letter goes one of the finest dairy machinery catalogs the John W. Ladd Company has ever put out. It contains illustrations and descriptions of every conceivable piece of machinery and equipment necessary for the ice cream, milk, butter and cheese manufacturing trades. This catalog is truly a text-book and solves many dairy manufacturing problems.

A copy will be sent to anyone who is interested, upon request.



NORTH CAROLINA ASSOCIATION ACTIVE.

In the October issue of The Ice Cream Review we published a North Carolina law, recently enacted, entitled, "An Act to Require Sanitary Conditions in Ice Cream Plants, Creameries and Cheese Factories."

This law was passed as the result of active efforts by The North Carolina Ice Cream Manufacturers' Association, of which Geo. L. H. White, of Raleigh, is president and A. E. Dixon, Fayetteville, is secretary. They are to be commended for their progressive work.

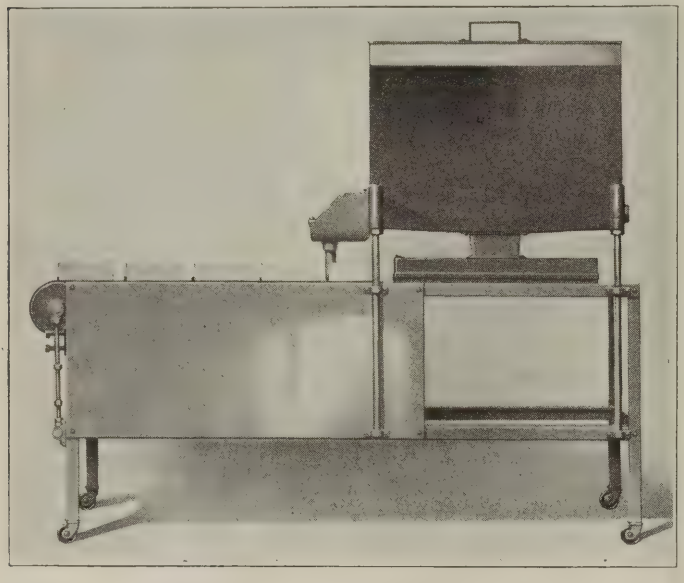
Petersen's
Ice Cream
Gain Indicator

Patents Pending

A simple and reliable device for determining the freezing gain or "over-run" in ice cream

A tester of exceptional value as a means of checking freezer efficiency. Shows deficiencies caused by improper refrigeration or handling of mix. Under normal conditions it enables ice cream makers to control freezing gain in accordance with solids content of raw material,—producing a finished ice cream uniform in texture and food value.

Absolutely fool-proof. No adjustment to make. Easy and quick to operate.



The durability, simplicity and reasonable price of Petersen's Ice Cream Gain Indicator entitles it to a place in every ice cream plant. **Fully guaranteed as to materials, workmanship and efficiency.**

Order to-day through your supply house or direct from us.

Coster-Petersen Co.
2531-33 Homer St.
Chicago, Ill.

NO HANDS TOUCH ICE CREAM TURNED OUT BY VALERIUS FILLER.

There is now offered on the market the new Valerius ice cream brick carton filler, which fills quarts, pints or one gallon ice cream slabs directly from the ice cream freezer into the desired packages, which saves time, labor and money and during which process no hands touch the ice cream. Either pint or quart cartons can be filled with no adjustment required—quarts and pints may be run on the machine at the same time. This filler does away with the old method and the unsanitary hand work and is operated automatically, untouched by hand. The maximum capacity is 24 quarts, or 48 pints per minute and may be operated as low as 12 pints or quarts per minute. The machine is 2 feet 2 inches by 8 feet and is 50 inches high to the top of the hopper, therefore, little floor space is required. It is

mounted on large, easy-rolling casters and can be easily pushed aside when not in use. It is operated by one-half horsepower motor, easily connected with any ordinary lamp socket.

Three girls can operate the machine to full capacity on quarts, pints or slabs; along with a man to place the filled packages in the freezer room. If only a small amount of cream is packed, only two operators are required to do the work, from making up the cartons to placing in the freezer room. The capacity is always the same whether the operator is filling quarts, pints or slabbing one gallon packages, in capacity of gallonage per hour. The operator can reduce the capacity 100 per cent when filling pint cartons by feeding only one-half as many to the conveying mechanism.

The cartons used to the best advantage with this machine are of telescopic type, either locked or stapled ends, with a preference for stapled ends as these are easier to assmble and are of a nicer appearance when the package is filled. The approximate inside dimensions of the uart carton are 3½ inches wide, 3⅜ inches long, and 2 5-16 inches deep. They are made of manilla stock, paraffined on all sides making them perfectly sanitary.

The cartons filled on the machine are full quarts and pints, are not loose in the package, and are easy for the consumer to strip and serve. The size of the cartons are standard, as adopted by the large manufacturers. Special machines are built to accommodate any desired size provided the machines are of the same pattern. The Davis-Watkins Dairymen's Manufacturing Company, 130 North Wells St., Chicago, Ill., have this machine for distribution.

SOME FACTS AND FIGURES.

The department of agriculture, division of foods and dairies, have secured and analyzed 246 samples of ice cream during the period from April 1st, 1921, to Dec. 1st, 1921. Out of these samples, 24 were found to be illegal for reason of running below the standard of 8 per cent milk fat. The total average of the 246 samples was 11.03 per cent milk fat. The 24 samples below standard, averaged 6.67 per cent, while the 222 samples above standard, averaged 12.13 per cent.

Regarding sanitation of ice cream manufacturing plants, we have inspected a great number throughout the state and find them as a whole, very good, but in some of the individual places, we have found quite a large percentage of unsanitary condition, such as, not having proper drainage to take care of refuse from manufacturing room, and cleaning equipment, bad floors, bad light and ventilation, dirty stairways and surroundings, slimy dashers in mixing machines, storerooms, many flies, syrups, sugar and flavoring spilt on the floors, rusty ice cream cans being used and in many cases dirty cans being returned from dealers.

Too much dependency is being put on tag that is placed on cream cans for the percentage of butter fat, as in some cases it has been found that manufacturer has had the correct percentage of mix, but the cream was not an 18 per cent, 20 or 22 as represented by the tag, thereby bringing his ice cream fat below required standard. This is a point the manufacturer should bear in mind and keep continually testing the raw cream that is purchased outside.

The department issued 344 licenses for wholesale and 694 licenses for retail ice cream business for 1921.

COL. C. C. MINER,
Assistant Superintendent,
Division of Foods and Dairies.

MINNESOTA STATE CONVENTION

Although our state convention closely follows the national convention recently held in Minneapolis, we want all of our friends to know that an effort is being put forth to make this one of the most interesting state meetings we have ever held.

Constantly changing conditions bring forth new problems which must be solved. Local problems can be discussed only at state meetings.

We want everyone interested in this district to be with us. Remember the convention date—Friday, January 20th—at the St. Paul Hotel, St. Paul, Minnesota.

Let me call your attention to the fact that this is immediately following the Wisconsin convention of January 17th and 18th and directly precedes the Iowa convention of January 25th and 26th.

We are going to mix business with pleasure. Following the day's business session there will be an evening's entertainment. Come and be with us.

Minnesota Assn. of Ice Cream Mnfrs.
W. M. PAULSON, Sec.,

BAKER ICE MACHINE CO., INC., OF OMAHA, OPEN FORT WORTH BRANCH.

In order to properly serve their increasing trade in that territory, the Baker Ice Machine Co., Inc., of Omaha, have opened up a branch house in Fort Worth, Texas., at 207 Front St. Mr. J. E. Rasmussen, vice president of the company, will be in charge, and Messrs. Angell and Kauffman will represent the firm in the territory.

No Wonder They Smile!

—for ice cream stabilized by ESSEX Gelatine looks as delicious and wholesome as it invariably proves to be. No separation of fats from the milk and its water content—hence perfect digestibility and no ice splinters.

Your customers will wish their friends to try an ice cream that is uniform; pure; smooth as the cream it is made from!

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

HAVEMEYER BELIEVES SUGAR INDUSTRY HAS PASSED CRISIS.

It is the belief of Horace Havemeyer, of New York, director of the Amalgamated Sugar Company, that America's sugar industry has passed through a crisis and is now with its feet upon the ground.

Mr. Havemeyer recently finished a two weeks' inspection of the western sugar factories in which he is interested. He expresses the optimistic report that the worst is over and there is a very bright future for the industry.

* * *

With the October returns at hand, on refined imports, in Facts About Sugar, completing the figures for the first ten months of 1921, a total importation of 2,554,742 tons is shown, of which 2,023,938 tons were supplied by Cuba, 134,124 tons were duty free sugars from the Philippine and Virgin islands, and 216,679 tons were full duty sugars, largely from Santo Domingo. This is a good deal smaller than the importation in the corresponding period of 1920 and 1919, (but is larger than that of preceding years, as the following table in tons of 2,000 pounds) indicates:

U. S. Sugar Imports.

Year—	October	Ten months
1921	180,984	2,554,742
1920	135,853	3,639,149
1919	285,635	3,196,070
1918	148,457	2,381,918
1917	89,419	2,396,665
1916	169,014	2,507,231
1915	94,251	2,394,399

* * *

Standard granulated at the beginning of December was quoted at 5.30 cents, less 2 per cent, and plantation granulated from 4.50 to 4.75 cents.

* * *

New Plan to Relieve Market.

Havana, Nov. 22.—A bill providing for the taking off of the world's market of 1,200,000 tons of Cuba's surplus supply of sugar of the 1920-21 crop by turning it into alcohol or other derived products, or destroying it, was introduced in the House of Representatives on November 22.

The bill proposes that the sugar shall be taken over by the Cuban government, which shall indemnify the owners on the basis of a valuation of 2 cents a pound, in warehouse. To provide the needed funds, the bill proposes a tax of 20 cents a bag on all sugar manufactured in Cuba. Clauses are inserted providing for the punishment of those who may try to conceal production.

* * *

Supply Outlook for the Coming Year.

Now that the cane grinding season of 1920-21 has reached its end in Cuba with a total output of 3,935,000 tons, or only 32,000 tons less than the crop of 1918-19 which was the largest ever produced in the island, says Facts About Sugar, it becomes possible to form a fairly reliable comparison of the supply situation confronting the United States market at the end of November, 1921, as compared with that of one year ago.

Two contrasting features immediately appear in a comparison of this kind. While actually one neutralizes the other, they do not eually affect trade sentiment for the reason that one is invariably emphasized in discussion of the situation, while the other, more frequently than not, is entirely overlooked. In every review of current conditions chief attention is directed to the fact that unshipped stocks in Cuba are a million tons greater today than one year ago. On the other hand, supplies in the hands of refiners and distributors in the United States, were a million tons greater at the end of November, 1920, than they are at the present time. In striking contrast to the congestion of raw and refined supplies throughout the trade a year ago is the fact that such stocks at the present time are at an abnormally low level. Were it not for the free movement of domestic sugars, including beet granulated. Louisiana cane, and the refined product of Hawaii shipped through San Francisco, there would exist at the present moment an actual trade shortage, due to the fact that refiners and distributors had allowed their supplies to become virtually exhausted.

Moreover, at the end of November, 1920, Porto Rico still had on hand 50,000 tons of unsold sugar, while at present the supplies to come from this quarter are only 12,000 to 14,000 tons. The actual quantity of old crop sugars available to this market, therefore, is less than it was a year ago.

Turning now to new crop supplies, we find that the beet sugar crop now in the making is 10 to 15 per cent below that of last year, while a considerably larger percentage of the current output has been marketed. Larger sales of Louisiana sugar this year have offset the increase in the crop and leave the amount still to be disposed of about the same as a year ago. While harvesting and grinding of Hawaii's and Porto Rico's crops is still to begin, it is known that the 1921-22 output in these territories will be ten per cent or more below that of the past year. Supplies from all these sources remaining to be marketed during the coming season will be roundly 300,000 tons less than at the corresponding date a year ago.

Cuba's crop for the coming season is admittedly an indeterminate quantity. Plans for the limitation of production by delaying the grinding season have been widely discussed, but no definite action in this direction has been decided upon and possibly none will be taken. It is known, however, that a considerable number of mills in Cuba will be unable to grind and the falling off in production from this cause is estimated by well informed authorities at approximately 20 per cent, which would reduce the crop to roundly 3,200,000 tons. Even with a Cuban outturn of 3,500,000 tons, the total amount of sugar available to United States markets during the coming year will be over a million tons less than in the twelvemonth now ending, amounting to about 6,000,000 instead of 7,200,000 tons. While the supplies to be reckoned on for the coming year, even though we place the Cuban crop at a figure somewhat higher than it is likely to attain, promise to be substantially less than a year ago, they still represent more than this market can absorb.

With supplies from various sources, including two-thirds of the unsold stocks in Cuba, amounting to 2,650,000 tons and a possible consumption of 4,300,000 tons,

Yuletide Ice Cream—Hudson Flavored

WHAT a Christmas dinner it will be! What joyous, gladsome, happy expectancy prevails. With what loving care and planning Mother has worked to make "her" Christmas dinner one we shall always remember — everything must be just right; the best, the purest, yes "just lovely." . . . And, of course, when we have enjoyed the repast, and the table is cleared for that which especially the children have eagerly awaited—the ice cream—Mother still worries a little and hopes that it will be so temptingly good, so deliciously and delicately flavored as to further enhance the joyous spirit at the Christmas dinner table and, thus make more complete her day.

Need we state here how much it means that your Christmas Ice Cream carries with it that delicate, subtle, indescribable vanilla flavor, the perfume of the cream, which lingers like the wafted aroma of lilac in the early spring breezes. Know this, tho; for many, many past Christmas dinners, Hudson's Vanilla Flavors were always of that essence of quality which made the Christmas Ice Cream perfect.

The Hudson Manufacturing Company

119-121 North Union Avenue

CHICAGO

the United States market will be able to take from Cuba for its own use 1,650,000 tons, or, including probable exports of refined, a total of slightly over 2,000,000 tons. Of course a part of Cuba's crop, and possibly a considerably larger amount than was so disposed of during the past year, will find a market in Europe. Assuming that a million tons of Cuban sugar can be marketed in this quarter, consisting of 400,000 tons to be exported from the United States as refined and 600,000 tons to be sold direct as raws, we find that Cuba can look with assurance to the sale of 2,600,000 tons, in addition to the unsold stocks of old crop sugars now on hand.

Early in the present year the writer prepared an estimate showing that Cuba could expect to find a market in the United States and elsewhere for approximately 2,600,000 tons during 1921, in addition to the carry-over of old stocks. With only one month of this period remaining it seems probable that this forecast will be fulfilled almost to the letter. The prospect for the coming year indicates a probable market for an equal quantity, in addition to the large supply of old crop now on hand. Assuming that Cuba will hold the United States market against outside sugars and in addition will contend vigorously for a substantial share of the European trade, a crop of 3,000,000 tons would not leave an excessive stock to be carried over at the end of next year and might be wholly absorbed, but from present indications a production much in excess of this figure will mean a continuance of depressed conditions and unprofitable low prices.

* * *

Futures Market Coming to be Used by Producers in Disposing of Their Output.

On the old principle of the ill wind, it seems as if the sugar world is to benefit in at least one direction from the disturbed conditions that have prevailed during the past year in Facts About Sugar. For the first time, indications are, the sugar producer has started to realize the value of trading in futures, and the records of the New York Coffee and Sugar Exchange show that numerous producers have been utilizing this trade agency recently to dispose of at least part of their future production.

Trading in Larger Lots.

In the past few weeks transactions materially larger than have ordinarily marked the operations of the exchange have been recorded, sales of 20 lots, or 1,000 tons, and over having been made on the floor of the exchange.

Prior to this the average transaction consisted of one or two, or possibly five lots, and it was evident from the size of the contracts that an actual delivery of raw sugar was not the primary consideration in the transaction.

The larger sales recently made for positions as distant as next May, on the other hand, have been construed in sugar circles as representing offerings of sugar producers anxious to assure themselves of a certain market for their product as it came along.

The rules of the exchange prevent the publication or collection of figures showing the bulk of transactions from day to day, and it was consequently impossible to obtain an accurate record of the large transactions. Officials of the exchange, however, admitted that the volume of business had been of more importance than previously, and went as far as to vouchsafe the information that in one day's trading recently over 9,000 tons of sugar had changed hands.

Buying for Foreign Account.

It would seem from the statement of exchange officials that the buying interest has been scattered, a good deal of the buying being done by foreign countries, though presumably not by Europe in the main.

There was an appreciable spread between December quotations and those of other months at the end of the current week, short interests apparently trying to cover on this month. The range of raw prices was as follows:

	High	Low	Latest
December	2.35	2.26	2.35
January	2.30	2.20	2.22
March	2.23	2.19	2.23
May	2.34	2.30	2.33
July	2.43	2.39	2.43
September	2.50	2.49	2.50

Only three transactions in refined were recorded during the week up to the time of writing, these being in November at 5.65, 5.50 and 5.60 respectively.

⚜

ICE CREAM TRAVELS OVER 2700 MILES.

The Esmond Dairy Co. of Sandusky, Ohio, made a shipment of five gallons of ice cream to The Pacific Ice Cream Manufacturers' Association sixth annual convention, held at Seattle, Wash., November 14-15-16, which caused no little comment and attention.

The ice cream was made on Monday, Nov. 7th, held in the ageing tank until Wednesday, Nov. 9th, and shipped on Thursday, Nov. 10th. Mr. Watson, director of traffic of the American Railway Express Co. at Cleveland, arranged to have the ice cream re-iced and properly cared for enroute; re-icings were made at Chicago, Minneapolis, Fargo and other points west.

Mr. Jos. E. Dunne, president of the Pacific Ice Cream Manufacturers Association, appointed a committee to score this ice cream. The score card used was a copy of the cards used by Mr. O. E. Williams, ice cream specialist in the U. S. Department of Agriculture at Washington, D. C.; the ice cream scored 97. The committee was composed of Mr. Frank Hardy of the Buttercup Ice Cream Co., Spokane, Wash.; Mr. Joe Breckel, of the Maid O'Wanna Ice Cream Co. of Vancouver, and Mr. Paul Gregory of Salem, Ore.

The ice cream was on the road about six days and seven nights, having traveled over 2700 miles and arrived at Seattle in perfect condition. It was scored as follows:

Flavor	45 points
Texture	22 points
Body	10 points
Appearance	10 points
Color	5 points
Package	5 points

Ninety-seven points were allowed out of a possible 100.

The success of this shipment clearly proves that the flavor will not freeze out; and the fact that the can of ice cream was full when it arrived at its destination, proves beyond a doubt the stabilizing qualities of gelatine.

The Esmond Dairy Company standardizes their ice cream at 10½ per cent butterfat, the state law being 8 per cent and 35 per cent total solids. Their mix is held in Elyria glass enamel tanks of which they have two 3,000 gallons capacity. The C. W. brand vanilla and the Essex brand gelatine were used in the packer of ice cream sent to the coast.

This shipment clearly demonstrates the fact that the ice cream business is widening in its scope of possibilities. In a few years from now it may be possible for eastern tourists to go to sunny California to spend the winter and have their favorite brand of ice cream shipped from the east to grace their table in the west.

IOWA CONVENTION.

The twelfth annual convention of the Association of Ice Cream Manufacturers of Iowa will be held at Cedar Rapids, January 24th and 25th. This has been made a two, instead of a three-day session, which is in line with the new spirit of business economy and it is intended that as much shall be accomplished in the two days as is usually put through in three, by opening the sessions earlier and on time, and making them intense and snappy.

An interesting and valuable program is being arranged. Iowa ice cream conventions have gained a wonderful reputation for their generosity of sociability and for the sound business benefits derived from them and this meeting will be no exception.

Special arrangements will be made to properly entertain the ladies and to show them a good time. They are becoming a regular and necessary part of the Iowa meetings and as a result of their attendance and participation many are becoming enthusiastically interested in the industry.

I believe that every manufacturer in Iowa, whether a member of the Association or not, should attend this meeting. There are problems confronting members individually and the industry as a whole that can be solved only by concerted consideration and opinions freely discussed as is made possible in a meeting of this character.

This is the opportunity of competitors to renew friendships, to iron out difficulties and misunderstandings and to exchange ideas; this is the place to rejuvenate, to pep up and get ready for the next season's campaign, for unless all signs fail, every manufacturer will, before the next season is over, need all the pep he can generate himself or borrow from his neighbor, so it behooves everybody to be at Cedar Rapids, January 24th and 25th. As there are only two days, better arrive the day before and be ready to get off with both feet at the start.

The Poodle Dogs will be on hand to greet and treat us and do their usual generous share toward making the meeting a success and a winner.

W. S. WILCOX, President.

NO FIVE DAYS LAW IN OREGON.

There was some discussion in The Ice Cream Review some time ago regarding the law in the State of Oregon which required retailers to return empty ice cream containers to the manufacturer within five days after date of shipment to the retailer.

We have been informed by Mr. J. T. Dunne, of the Hazelwood Ice Cream Company of Portland, Oregon, that the clause pertaining to the five days limit was omitted from the law recently passed. It appears that it was the intention of the sponsors of this bill to include the clause relative to the five days limit, but that through some unaccountable error was omitted.

DALLAS, TEXAS, FIRMS CHANGE HANDS.

An important business change is reported from Dallas, Texas. The Crystal Ice Cream Company and the C. W. Smith Ice Cream Company of that city have been purchased by the M. B. Ise Kream Company of Waco through General Manager McLendon. The C. W. Smith plant will be dismantled and business transacted at the Crystal Ice Cream Company plant under the firm name of The M. B. Ise Kream Company. Mr. H. F. Owsley, formerly of the Crystal plant, will be in charge of the consolidated business.

THE BARBER COMPANY DEMONSTRATE THE ROGERS' BRICK MAKING MACHINE.

One of the features of the Illinois convention was a demonstration of the Rogers' brick filling machine, arranged by the A. H. Barber Creamery Supply Co., through the courtesy of Mr. Mark Shanks of the Standard Ice Cream Co.

A large number of the out of town members of the association availed themselves of the opportunity of going out to the splendid plant of the Standard Company early Wednesday morning to see this remarkable machine.

The simplicity of the machine and the accuracy with which it does the work was a surprise to everyone. The machine first filled the Neopolitan brick with a very even distribution of the three colors. It also filled individuals nested in a quart carton, with the same absolute accuracy. Bricks put up the day before and hardened were examined, and all were impressed with the splendid appearance of the brick, as well as their excellent quality. The fact that the quality of Mr. Shanks' ice cream was approved of was evidenced by the substantial amount consumed by visitors.

After the Neopolitan demonstration, Mr. Shanks very kindly put up for the benefit of the visitors a one color cream with cherries in it, and the machine did the same excellent work on that. Besides the representatives of the Barber organization were present Mr. Don Rogers, and Mr. John W. Ladd, the general distributor of the machine.

R. W. FURNAS HAD MOST POPULAR BOOTH.

The accompanying picture is of the booth occupied by the R. W. Furnas Ice Cream Company of Indianapolis, Indiana, at the industrial exposition held in that city in October.

The ice cream trade was one of the best presented at this convention which was held under the auspices of the manufacturers' committee of the Indianapolis Chamber of Commerce. The exposition was open only to exhibitors whose products were made in Indianapolis.

One of the most valuable results of the show was the change from pessimism or near pessimism to optimism. Direct sales were made in a volume that proved the crisis has passed.

A charge of fifty cents was made for entrance and approximately 200,000 persons saw the exhibit.

W. R. Kemper was in charge of the R. W. Furnace Company's booth. The exhibit was the cause of many near-panics as the company gave away approximately 5,000 bricks of ice cream a day. On the morning which was given over to school children, the company was compelled to stop giving away ice cream, the police fearing some of the children might be hurt in the scramble. The company showed ice cream in the making and displayed some of the most modern machinery used in the business.

The exposition was a great success and all exhibitors were well pleased with the results of the crowds around the ice cream booth of the Furnas Ice Cream Company certainly demonstrated that had they the money to buy, they still had the appetite.

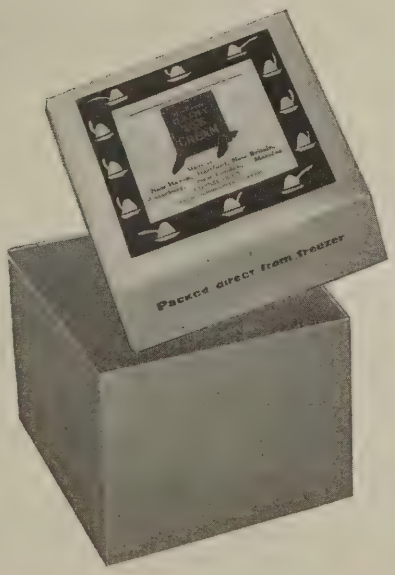
IN THE HALL OF FAME.

The discoverer of ice cream is certainly entitled to his niche in the Hall of Fame, and it is merely carelessness on the part of the millions, whose palates he tickled, that he is not there. Somebody had better get busy and find some ancestors of Sambo Johnson so that his likeness can be made immortal.

Innocence would need no guardian if curiosity was not a leading feature in our mental make-up.

* * *

Industry is more apt to lament that more was not accomplished than to boast of what has been done.



"READY"  BRICK BOXES

are specially treated two-piece boxes, which eliminates handling and wrapping. No parchment bags necessary with the Cardy "READY" Brick Box. Box needs no folding or tucking in of ends. Boxes come nested, and ready to use—saving space and freight.

Filled directly from Freezer by hand or with Rogers or Mojonnier Machines. Cream can be removed by dipping in warm water same as the tin moulds or by cutting down sides with sharp knife. Will save all the expense of collecting and washing of tin moulds.

The *Cardy "READY" Brick Box is the only brick box on the market that can be packed in salt and ice without injury — water-proof, moisture-proof, and will not soak up and become soft.*

Let us tell you more about the advantages of this new "Ready" Brick Box.

Cardy Ice Cream Box Company

Ice Cream Pails in New and Attractive Design

Our Ice Cream Pails are made from the very best stock obtainable, highly sanitary, and printed with new and snappy designs in one or two colors.

Organization Results in Favorable Publicity for the Ice Cream Industry

By ROBERTS EVERETT, Secretary-Manager, Association of Ice Cream Supply Men.

NOT since the first few years of its history when prosecutions for the violation of various pure food statutes, often unjustifiable, marked the month to month history of the ice cream industry and brought consequent newspaper attention, has the general press of the country devoted so much space and comment to this business of ice cream as it has recently.

This publicity, it can be noted with gratification, is practically entirely favorable today. Ice cream prices still evoke some criticism and complaint in print, but in almost every case such press attention relates merely to local conditions. The publicity now being received by the industry as a whole is of a character not known before.

The Association of Ice Cream Supply Men recently issued a folder reproducing some press stories of recent dates, and listing cities the newspapers of which have carried articles concerning the development of the ice cream business. The folder also lists a number of other industries, the trade publications of which are watching events in the ice cream industry with interest and complimentary comment.

The most notable instance cited by the Association of publicity received by the industry is that of an article in the New York Tribune of October 30th, 1921, under a two-column heading, "Ice Cream Supply Men Codify Business Ethics," which is as follows:

"Fair Practice Rules Govern Relations of Seller and Buyer as Well as Competitors.

"Business ethics, because of the unethical conduct of many buyers and sellers that have come to light within the last two years of wild business fluctuation, are receiving considerable attention among commercial organizations. A flood of 'cancellation and return bureaus," of special committees and bureaus established in various industries for the adjustment of disputes between buyers and sellers have come into being. All of these movements have accomplished something in the direction of elevating business to a higher plane.

"A new method of attack, however, has been devised by the Association of Ice Cream Supply Men, which has put into operation what is known as a 'fair practices code.' This code consists of forty rules, fourteen of which govern the relations of the seller against the buyer and twenty-six governing competitive action.

"The code was drawn up by a committee consisting of O. S. Jordan, of Brown & Shaw, New York; B. B. Scott, Providence, R. I.; L. B. Ismon, of the Essex Gelatine Company, Boston; K. W. Schantz, Buffalo; H. H. Miller, Miller Industries Company, Canton, Ohio, and Roberts Everett, secretary of the association.

It has become almost a business axiom that unethical conduct in business harms not only the one at whom the unethical action was aimed, but the perpetrator and his competitors as well. In other words, the entire industry feels the reaction. For this reason, where concentrated opinion can be gathered in trade associations, the elimination of unfair and unethical conduct has loomed large.

"The new code of fair practices governs the transactions of companies with an invested capital exceeding $100,000,000, with an industry spending $200,000,000 this year in merchandise and labor bills. The companies in the association include all the allied trades upon which the ice cream manufacturing industry is dependent for machinery, equipment, supplies and special services. Although several of the rules laid down in the code apply particularly to the ice cream supply business, the majority are broad enough to apply to almost any line of industrial endeavor. The code already has aroused much interest among other trade associations and is serving as a model for other codes now in process of formation. Violation of the code, which proved provides grounds for the expulsion of the offending member from the association attended by full publicity.

The Tribune then reproduces the Fair Practices Code of the Association.

Another noteworthy instancing of the ice cream industry is contained in an article. "The Right Side of Trade Associations," in The Nation's Business of November 1921. This is also cited by the association. The Nation's Business as the organ of the chamber of commerce of the United States, according to O. S. Jordan, president of the association, reaches the desks of many thousands of the country's leading business men and industrial executives. The Nation's Business' reference to the ice cream industry and the association is, as reproduced in the leaflet:

". . . a vast amount of the work of trade associations does lend directly to the public benefit. An association which adopts and enforces a code of business ethics does so primarily for the guidance of its members, but a secondary but inevitable result is that the public is protected. The fair practices code of the Association of Ice Cream Supply Men furnishes a ready illustration. Here are some things forbidden:

"I. Misbranding of articles as regards materials or ingredients: 'inferential misbranding,' i. e., using trade names or descriptive terms which simulate trade names or descriptive terms of unadulterated or genuine goods.

"3. Commercial bribery of customers by money, long-term credits, not in keeping with trade custom, excessive entertaining or any other means.

"II. Selling food or a product to be put into food which, because of its nature or method of manufacture or for any other reason, violates a local, state or federal ordinance or law.

Still further comment from the press is reproduced in an article from the Atlanta Constitution of September 18th, 1921. This article under the heading of "Fair Practices Code of Big Body," says:

"One of the most encouraging things in connection with economic conditions in this country is the fact that we hear more every day about trade codes, fair practices, etc. In defferent industries the members of different organizations, of their own free will, are drawing up agreements whereby they can give their buyers more protection.

"Perhaps one of the most interesting and effective codes of ethics now in force is that of an organization known as the Association of Ice Cream Supply Men. This organization has incorporated in a little pamphlet known as its 'Fair Practices Code,' some governing merchandising regulations that should be of interest to every business man, whether interested in the production of ice cream and ice cream manufacturing machinery or not.

Selling below cost to one particular firm, bribery of customers' employees, misbranding articles, distribu-

tion of samples of a better grade than the actual product—these are just a few of the acts of commercial thievery tabooed by the ice cream supply organization, which represents the leading manufacturers of various kinds of machinery and equipment, from motor delivery vehicles to ice picks.

"It governs its members' advertising policies, permitting of no false claims. It will not allow its members to pay jobbers' representatives bonuses for pushing their particular products to the neglect of a competitor's.

"One of the most remarkable edicts, showing the great care taken in combating trade evils, is the ruling against allowing the members to 'excessively entertain ›ective buyers.'

"In all of its regulations against questionable salesmanship the effort plainly stands out to make manufacturers make honest goods and sell them on their merits.

"To see if these articles of trade have been a success it is only necessary to call attention to the remarkable success that has attended the activities of this association's members in the last couple of years."

According to this leaflet, newspapers in the following cities, among numerous others, have paid the tribute of news articles to the work of the Association of Ice Cream Supply Men in behalf of the continent's ice cream industry: Chicago, Boston, Milwaukee, Portland, Philadelphia, Baltimore, Allentown, Hartford, Bridgeport, Portland, Middletown, Waterbury, Syracuse, Toledo, St. Paul, Sioux Falls, St. Louis, Council Bluffs, Dayton, San Francisco, Grand Rapids, Decatur, Memphis, Lansing, Duluth, New Orleans, Nashville, Denver, Atlantic City, Cincinnati, Watertown, Charleston, Columbus, Knoxville, Dallas, Mobile, Pensacola, Chattanooga, Athens, Elmira, Buffalo. According to the same authority, trade publications of the creamery, metal, dairy, bottling, drug, confectionery baking and kindred fields are commenting from time to time on the results that organization is producing in the ice cream industry.

TO THE MEMBERS OF THE WISCONSIN ASSOCIATION OF ICE CREAM MANUFACTURERS.

The Wisconsin Association of Ice Cream Manufacturers will hold their annual convention at Milwaukee, Hotel Plankinton, under date of January 17 and 18, 1922.

I think it is more important than ever before that each manufacturer attend this convention. We are confronted with problems today that mean much to our industry and can only be solved by organization. It behooves every manufacturer to bring these problems up before our convention meetings and try and have them discussed to your satisfaction.

Co-operation is badly needed by all manufacturers today. New factories are springing up every day and it is up to all of us to get these manufacturers to attend our convention and join our association so they may see some of the difficulties confronting the ice cream manufacturer.

The officers of the association are trying hard to prepare an interesting program and the "Badger Flyers" are furnishing an elaborate entertainment.

Don't say you can't spare the time to attend, but be there.

We will all be there — join us.

D. D. SMITH,
President.

CORRESPONDENCE SCHOOL.

Editor Ice Cream Review: Answering the appeal for help found on page 152 of the September issue, I would say that the trouble lies in one of two causes, possibly both. First, I do not believe they are freezing the cream enough before pulling. A cream pulled too soon and packed in salt and ice, will ice just as he describes. The fact that only part of the cream ices makes me believe that this is the whole trouble, because his ice cream maker pulls some so very soft or sloppy and some which is well frozen. Then, too, I notice he says that he pours it in five-gallon cans instead of drawing direct into the five-gallon cans and putting immediately into the ice.

Second, there is no good reason why his cream should be allowed to get soft after once hardening. I would call that carelessness. However, that will give him his icy cream just as described. I would suggest that he pay special attention to having every batch pulled when well frozen, not before, and that he have the ice there to keep the cream hard, even if he has to hold a larger stock of ice. If well covered it will not melt much. Neither fast hardening nor slow hardening would have the effect he describes, but cream not frozen enough will show the same result as mentioned, whether packed in salt and ice or put in a hardening room.

E. LOVE.

548 Colyton St., Los Angeles, Calif.

* * *

The following was furnished an ice cream manufacturer as a suggestion as to a talk he contemplated giving to people not familiar with the manufacture of ice cream:

"Gelatines of an organic nature, similar to milk, cream, butter, etc., all coming from the same origin, the cow. It is an asset and not in any way detrimental when used in confection products. For reason that it is regulated as to mineral properties, bacterial content and any other objectionable features, by the National Pure Food laws, manufacturers are stopped from selling any grade of their gelatine that does not comply with specifications of said laws. It is used in a large number of articles, a few of which are globules and capsules, marshmallows, jellied tongue, jellied fruit, jams, jelly powders, such as Jello, Jiffy Jell, etc., glazing of nuts, ice cream.

"In the latter product it is used in order to emulsify or distribute the moisture content of the ice cream mixture, thereby preventing the moisture when frozen with the mixture from becoming ice crystals, or lumpy ice cream.

"Ice cream that leaves a starchy taste and sticks to the roof of a person's mouth is caused from using fillers, such as corn starch. Gelatine is a binder and not a filler. Only a very small amount of gelatine is required, about three to four ounces per ten gallons of ice cream.

"A great many people will say, why not make ice cream like we do at home, but if they would stop to consider the fact that to make an ice cream of this caliber you must use entirely 30 or 40 per cent cream, which would naturally make the price per gallon prohibitive from a commercial standpoint."

* * *

AN INTERESTING DISCUSSION ON GELATINE.

Very naturally we took an interest in Professor Burke's article in the September Ice Cream Review, on Gelatine.

There is one little point in it that we do not agree at all on, and that is the matter of temperature to be used for dissolving. We put a printed notice in every barrel of our gelatine, suggesting to the user that they soak the gelatine in as near one gallon of water as possible, and then heat the solution to 180 degrees F.

We have been making gelatine a good many years, and we are quite confident in telling people that this temperature will not hurt the gelatine. Of course, it is not to be expected that they are going to keep it at that temperature hours at a time. It will not affect the jelly strength at all.

It does insure the product being very thoroughly dissolved, and in addition, makes it a commercially sterile gelatine when going to the mix. Any temperature under 180 will not sterilize gelatine, as extensive tests showed some years ago when it was looked into.

We are very glad to offer the above as food for thought as our recommendations have been a help in many cases, and our experience is such as to warrant our advocating these principles every year.

L. B. ISMON,
Manager Essex Gelatine Company.

Reply: I was very much interested in receiving your letter relative to my article on Gelatine, which appeared in the August Ice Cream Review. I note that you take exception to my statement regarding the temperature to be used for dissolving gelatine, and in this connection I wish to call your attention again to my statement along this line, which reads as follows: "At a temperature of about 140 degrees F. gelatine usually begins to lose some of its solidifying powers, yet the loss is so slight as to be negligible. Indeed, the writer has heated some solutions of the better grades of gelatine to a temperature of 170 degrees F. before adding these to ice cream mixes without any noticeable detrimental effects. However, for ice cream making it is not advisable to heat gelatine to a higher temperature than necessary to insure a good solution with the mix."

If it so happens that your gelatine will form a better solution with the ice cream mix, as you state, at 180 degrees F. then that is the temperature of course which you should recommend and this, you will notice, follows right along with my last sentence. As far as the gelatinizing power be affected at a temperature of 140 degrees F. or over I beg to refer you to an interesting study made by C. R. Smith and published in the journal of the American Chemical Society, February, 1919, volume 41, page 135, entitled, "Mutarotation of Gelatine." Also to an article by Rennosuke Shoji, published in the Biological Journel for November, 1919, volume 13, No. 3, entitled, "Studies on Coagulation."

Experiences of these men, and also the writer, have shown that gelatine will be slightly affected with regards to it's gelatinizing power when subjected to this high temperature, and the higher the temperature the greater the effect. You make mention of the fact that you advocate soaking gelatine in a gallon of water and then heating it to 180 degrees F. before adding it to the ice cream. This process has been tried time and time again by the writer, who has heated gelatine to as high as 180 degrees F. with no noticeable detrimental effects if the gelatine be added immediately to the ice cream as soon as it is brought to this temperature; however, I desire to call your attention to the fact that at the present time it is customary in most of the leading ice cream plants to add gelatine to the ice cream mix before pasteurization and thus dissolve it along with the other constituents in the mix.

Now if the ice cream mix were to be heated to 180 degrees F. the resulting product would suffer from a very pronounced scorched flavor. Experiments by the writer, which, by the way, you will find in the June, 1920, issue of The Ice Cream Review, page 94, under the title of "Some Gelatine Experiments," will prove that

"In the service of the ice cream industry . . . ."

The Association of Ice Cream Supply Men in that service protects the ice cream business of the country in its purchases . . . .

Extends its influence . . . . . .

Assists its organizing efforts . . . . . .

Increases its opportunities for testing and comparing goods . . . . . .

Makes easier the adoption of scientific methods and equipment . . . . . .

Serves in every legitimate way its advancement, its enlargement, the cementing of its foundations in the continent's daily life.

In such a name, *the service of the ice cream industry*, is The Association of Ice Cream Supply Men organized and its whole energy expended.

The Seal

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
1328 BROADWAY NEW YORK

of Safety

the better ice cream is made when gelatine is not prepared previous to adding to the mix but added to the mix and pasteurizing along with it.

You make mention of the fact that any temperature under 180 degrees F. will not sterilize gelatine as extentive tests showed some years ago when it was looked into. I would like very much to see those tests if you have them on file. In this connection I would like to state further that temperatures of 180 degrees will not sterilize any material in the true sense of the word. It is simply a high pasteurization temperature for complete sterilization of any liquid product which, as a rule contains spores of bacteria, a temperature of 212 degrees F. (boiling) for six or seven hours would be required.

You speak of commercially sterile gelatine and in this connection I suppose you refer to gelatine which contains no vegetative form of bacteria. I suppose we could speak of pasteurized milk as commercially sterile milk or could use the term of commercially sterile ice cream mix if we were speaking of this product, however, the germs which really have a detrimental effect on ice cream or other dairy products are not, as a rule, the spore formers but rather the non-spore formers and these I think you will find are readily killed at a temperature of 145 degrees F. for thirty minutes, which is the pasteurization temperature and as I state the temperature used in most up-to-date ice cream plants for heating and pasteurizing their mix containing gelatine.

I thank you very much for writing this letter to me and I assure you that I am greatly interested in both the welfare of the ice cream manufacturer and the gelatine manufacturer. In fact I intend to have an article on the Wonderful Food Value of Gelatine in The Ice Cream Review in the near future.

A. D. BURKE.

* * *

Editor's Note: We will be glad to have other readers of The Ice Cream Review write us their opinions on this subject.

SOUTHERN EXHIBITION GIVES DIXIE ICE CREAM MEN GREAT OPPORTUNITY.

The Southern Exhibition of the Association of Ice Cream Supply Men was held in the Auditorium-Armory, Atlanta, Ga., November 28th to December 2nd inclusive. Ninety-two exhibitors occupying 123 booths participated, their displays filling the South's largest building for such purposes.

The exhibition was held conjointly with annual conventions of the Southern Association of Ice Cream Manufacturers, the North Carolina Association of Ice Cream Manufacturers and the Twri-State Association of Ice Cream Manufacturers of Alabama, South Carolina and Georgia. The registration totaled 750 persons affiliated with the ice cream industry of which 200 were owners or executives of ice cream plants in the following twenty States: Alabama, Arkansas, Florida, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Minnesota, Mississippi, Missouri, New York, North Carolina, Ohio, Oklahoma, South Carolina, Tennessee, Texas and Virginia.

The exhibition opened Monday morning, November 28th. Monday night a meeting of the Salesmen's Club of the Association of Ice Cream Supply Men was held in the Piedmont Hotel, attended by 250 persons, at which Thos. J. Stewart, president of the club presided.

Tuesday was featured by a well attended dance given on the roof garden of the Ansley Hotel by the Dixie Flyers, an organization of Southern supply salesmen auxiliary to the Southern Association of Ice Cream Manufacturers.

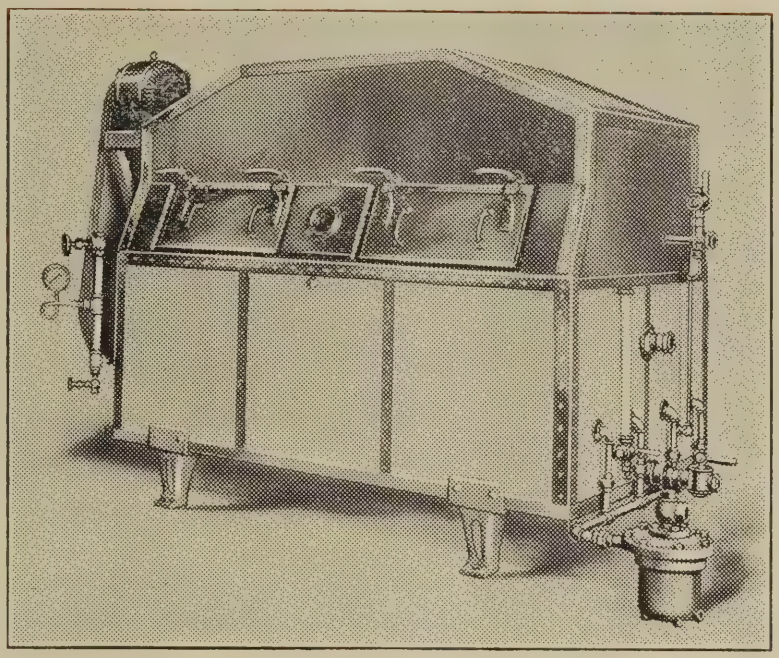
Wednesday the ladies of ice cream men and supply men attended a luncheon as guests of the Dixie Flyers and in the evening were theatre guests of the Association of Ice Cream Supply Men. The ladies also on the same day made up a motor party driving through and about Atlanta, Atlanta ice cream manufacturers acting as hosts. The Dixie Flyers in a meeting the preceding day elected B. B. Scott, Providence, R. I., president and P. N. Miller, Jr., Birmingham, Ala., vice-president.

Thursday a Southern Ice Cream dinner, entertainment and dance was held under the joint auspices of the Southern Association of Ice Cream Manufacturers and the Association of Ice Cream Supply Men, W. M. Sidebottom, Jr., and O. S. Jordan, presidents of the respective organizations acting as toastmasters. Speakers of honor following the dinner were Governor Thos. W. Hardwick of Georgia and Herbert Clay, president of the State Senate of Georgia.

"The Southern Exhibition was promoted and managed," according to O. S. Jordan, president of the Association of Ice Cream Supply Men, "in order to give the South, a section that has been the last to show broad signs of recovery from the great industrial depression of several months ago, but which on the contrary enjoys the most favorable ice cream weather in the country and has before it perhaps greater unrealized possibilities in ice cream than any other region—to show this wide section the latest developments in the modernized production and merchandising of ice cream, believing the providing of such opportunities to be the greatest service possible at this time and in present conditions to the national ice cream industry as a whole. We believe this purpose to have been justified by the Southern Exhibition and are glad to have the realization that our organization has been of aid."

ICE CREAM IN A CHOCOLATE KIMONA.

The idea and popularity of the chocolate bar has eventually found itself developed as a sales promoter for the ice cream trade.



Right now the Central West is alive with interest in this new style ice cream product. It is a slab of brick ice cream about one inch square dipped in an especially prepared chocolate and then put in a foil wrapper. These chocolate covered "ice cream bars" are then packed in paper boxes or cartons, one or two dozen to the box, and handled in regular ice cream packers. The bars retail at 10c and are sold to dealers at about 80c a dozen bars. This leaves the manufacturer a fair margin for the extra trouble and makes it attractive for retailers to feature the confection. So far much push has not been needed to win the favor of the public and it has been a long day since anything has sprung into such immediate favor as ice cream in this chocolate coated bar form.

Ice cream in this latest fashion can find sale, especially at this season of the year, through a good many avenues that bulk ice cream would not be handled. At cigar counters, news stands or on railroad trains, chocolate coated ice cream will prove a popular confection.

The manufacturing equipment needed is not elaborate and no doubt as the demand increases and becomes known nationally, considerable improvement will be made to effect a lower cost of putting up ice cream in this form.

This chocolate coated ice cream bar is only another demonstration of the possibilities of promoting ice cream sales and the fundamental popularity of ice cream itself.

The Ruff Process has no equal when you consider Quality and Economy.

The Cream Production Company,
Port Huron, Mich.

Gentlemen:

Having used one of your Condensers for sometime, we are so well pleased with its merits and the product that it produces that we gladly recommend same to all that might be desirous of turning their skim and surplus milk into money.

At this time of the year we are using our whole milk and butter, and by condensing it slightly we get the finest mix, and the best ice cream ever produced.

We find that by using your Condenser that we are saving the money, you claimed we would.

Yours very truly,

Stroudsburg Creamery Co.

ICE CREAM CABINET OF QUALITY

STYLE No. 5

Construction of Our "Zero Brick" Cabinet

STYLE No. 4

An Important Part of Your Equipment

IT is to the advantage of any manufacturer to recognize the true importance of the ice cream cabinet and the necessity for employing only the kind which will afford perfect preservation of his product on an economical basis.

For many years, Grand Rapids Ice Cream Cabinets have demonstrated in actual service that they are the answer to the ice cream cabinet question. They are constructed with a thorough understanding of the qualities which a cabinet must have in order to effect ice conservation and withstand the action of the refrigerating agents.

Standardizing on Grand Rapids Ice Cream Cabinets is a step which leads to saving expense and promoting all around satisfaction.

VALERIUS JOINS DAVIS-WATKINS ORGANIZATION.

Mr. T. L. Valerius, Fort Atkinson, Wis., one of the best known designers and inventors of dairy machinery in the country, has resigned his position with the Creamery Package Mfg. Co., a position he held for 24 years, to accept a position with the Davis-Watkins Dairymens Mfg. Co.

T. L. VALERIUS

Mr. Valerius is well known throughout the dairy world as an expert of rare ability in properly laying out complete milk handling plants. He has originated and developed many new ideas for some of the largest ice cream and milk handling plants in and about our large cities. His principal work, however, has been connected with the invention and development of milk pasteurizing machinery, ice cream freezers, brick cutting and carton filling machines, combined butter churns and workers, bottle filling, capping and washing machines, milk and ice cream can washers, cheese making equipment, milk heaters, coolers, etc., etc.

In addition to this work, Mr. Valerius has had complete charge of the construction of these machines. He has actually built them, and put them into service for customers. This has given him a wide practical knowledge, such as can only be gained as the result of many years hard and efficient work. He will now use this practical knowledge in helping the Davis-Watkins organization with the building of the most modern and efficient dairy equipment and machinery in their four large factories.

Mr. Valerius plans to continue his policy of keeping in close and constant personal contact with those men who are interested in the development of new equipment which must reduce the cost of handling and improve the product. Work of this sort builds customer satisfaction, which can be oftained in no other way. It is an expert service, such as cannot be secured from any outside source, other than the manufacturing company properly equipped with men having wide practical knowledge of the problems and how best to handle them.

MAY ESTABLISH BRANCH IN EUROPE.

Mr. Arthur Mory, of the Mory Ice Cream Co., Appleton, Wis., set sail on November 25th for Europe, where he will look over the manufacturing field relative to establishing a branch of the Mory Ice Cream Co. There are few, if any, ice cream factories in Europe and the ice cream that is offered is of a very inferior nature and it is believed that a taste for the American product can be created and that there is a bright future for an American ice cream concern in Europe. Mr. Mory will make his headquarters in Paris for several months.

You cannot clear your conscience by straining it.

Association of Ice Cream Manufacturers of Pennsylvania

Proceedings of Annual Convention held at Erie, October 31, 1921.

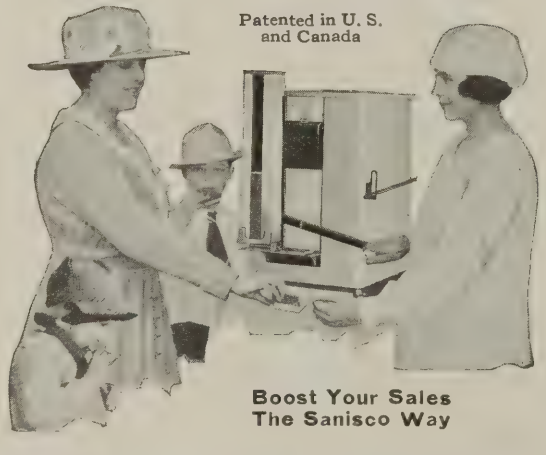
President Crane introduces J. B. Arbuckle, of Erie, Pennsylvania.

Mr. Arbuckle: Mr. President, Ladies and Gentlemen of this Association, the local manufacturers greet you upon this occasion, and thank you for having Erie as the place for holding this meeting, which we hope will be a source of pleasure and profit to you.

I am admonished to make my remarks short, so will say this,—we have a gentleman present whom I have known for many years, a man brought up on the farm, and who knows its associations. I have the pleasure of introducing to you the Hon. Miles B. Kitts, mayor of the city of Erie. (Applause).

Mayor Kitts: Mr. Arbuckle, Mr. Chairman, and Ladies and Gentlemen: I am sure it pleases me greatly to be introduced by such a staunch citizen of this community as Mr. Arbuckle. When my father used to bring me to town to market, I remember listening attentively to what Mr. Arbuckle and my father said to each other. I have known Mr. Arbuckle all my life, and it is indeed a pleasure to receive this introduction from him.

I am glad the chairman has admonished everyone to make short speeches. I have been so occupied with matters of state, church and office, I haven't had time to think of preparing a speech, so my few rambling remarks this afternoon will be extemporaneous. I have been staying temporarily at the hotel, and have watched the arrival of the delegates and the business of the convention, and you look to me like real business men. It is the duty of the Mayor, whenever a convention meets in the city to extend the hand of fellowship and give a sort of welcome address. We have many conventions in this city, and I am always glad to have people from north, east, west and south meet with us, especially Pennsylvanians,



It is not necessary to go into the history of Erie, but I do want to say that in the last ten or fifteen years the city has taken on a new life. I remember the street markets, stone pavements I believe in the market houses, where milk, cream, butter and everything was sold at one time, with no regard to regulating the commodity or the purity of the product.

One of the greatest civil engineering problems in any city of the size of Erie, I believe, is the Mill Creek tube; and you will do well to go up to 19th and French streets, up near the Erie County Milk Association, and see the gigantic work now under process of construction. I would also like to have you visit the Soldiers' and Sailors' Home, down where the vessels come in from the Great Lakes. At that point you will see an exact replica of Anthony Wayne's block house, and here the land is almost hallowed with the foot prints of men like Washington, Lafayette, and other heroes in the early struggles during the French and Indian wars. West, there is Gridley Park, and a monument on Cascade Park, in honor of the great hero, of whom Dewey said, "You may fire, Gridley, when you are ready." I am referring to Capt. C. M. Gridley, of Spanish war fame. Down at the foot of State street we have just completed a pavement and sidewalks to the steamboat landing. Here on the left you will see a replica of Perry's flagship, in which he won the battle of Lake Erie in the War of 1812. It is an exact replica of the boat sunk in Misery Bay one hundred years ago, and raised and reconstructed for the 100th anniversary of the battle, the Perry Centennial. The public library contains many relics of interest and education, which I cannot enumerate here.

We hope in the course of two or three years, when you come back to this city, to have a new depot. We got the contract through a few days ago, and the officials of several railway companies and other parties concerned assured us that they would start operations on the first day of April, 1922. When you get out at the depot, it makes you think we have a very ordinary town, indeed; but I am proud of Erie, proud of its growth, and proud of its people; and, as mayor of the City of Erie, I take pleasure in extending a hearty welcome to this convention of business men.

The manufacture of ice cream is in my estimation a very important industry, in its relations bringing in other milk products. There is no greater pleasure to me than going out on the farm and beat the hired man at milking. We do it by hand, too. I take a great interest in dairying, because I feel that from the soil I received enough strength to battle with the problems of life. Now, gentlemen, I have with me the great key to the city of Erie, which I am going to present to the chairman, (Presents a large gilded key tied with ribbon to the chairman, with the applause of the association). Gentlemen, I don't want you to in any way mistake this presentation. It will not unlock cellars.

Thanking you for the privilege of extending this address of welcome, which has been rather rambling,

Mojonnier Ice Cream Packaging Machine
Patented December 17, 1918. Process and other patents pending.

Mojonnier

Ice Cream Packaging Machine

THE Mojonnier Ice Cream Packaging Machine is a LABOR SAVER. It has reduced the labor of packaging from twelve to seven operations; has reduced number of helpers from seven to three; has reduced hardenings from three to one. It eliminates pouring into molds, dipping, cutting, wrapping and exposure to heat and air after hardening, thereby improving quality and texture of the brick ice cream. It prevents loss of ice cream and does not reduce overrun. The hopper is jacketed containing brine coils and outside insulation. Cream has been held in hopper for four hours without change.
Now in successful operation in plants of Goodman-American Ice Cream Co., Hydrox Co. and Lawrence Ice Cream Co., Chicago. These three big firms pack their entire output of three layer bricks on the Mojonnier Ice Cream Packaging Machine.

Sold on either a liberal rental basis or outright sale.

Write for descriptive circular and prices.

Automatic Force feed Positive in action. Fills exact measured quantity in either quart or pint cartons; carry home pails or round cartons.

from lack of preparation, I will close. I thank you. (Applause).

Chairman Crane: Does this include a free ride in the hurry-up wagon?

The Mayor: If you keep that key in your possession anything of that kind will fade away in the dim moonlight.

Hon. S. S. Robertson responded to the Mayor: It gives me great pleasure, in the name of the Association, to thank the Mayor for the cordial welcome which he has extended to us. Erie to me is not a new place at all. I am thoroughly acquainted with it, as I come every year to Chautauqua, and almost invariably stop off at this beautiful city.

I can scarcely remember a time in the history of the institution with which I have the honor to be connected, that we have not depended upon Erie for supplies and machinery. I might say also that our institution is closely connected with and interested in a new industry which we have started in Erie, which ultimately promises to be one of the big industries of the city in the near future. To my mind Erie is destined to be a very great city. Its progress in the last 10 or 15 years, to which the mayor has referred as predominant will, because of the natural advantages it has, and the knowledge which its sons are exhibiting, be a great manufacturing center.

I have the honor to be a friend of one of Erie's great citizens. This man finally found his true place from serving on the local bench, and was elevated to the Supreme Bench of the State of Pennsylvania. He is a gentleman whose modesty, fortunately for the citizens of Pennsylvania, wase not strong enough to entirely obscure the character which Supreme Justice Walling has. (Applause). So I have a good many ties, one might say, with Erie. I thank the Mayor for coming here and giving us this welcome. (Applause).

Chairman Crane: I will ask Mr. Robertson to read the Chairman's address, owing to my inability to do it myself.

Mr. Robertson: For the past several years I have been, as you all know, somewhat less closely in touch with you than I used to be, less well posted in regard to your day-to-day affairs; not so well informed about the details of change and progress in the industry. For this reason, perhaps, you will think I ought to confine myself at this time to a simple greeting to old friends and leave you, with your more intimate knowledge of conditions as they are today, to find your clear road to further progress in the industry and continuing and greater success collectively and individually.

But I have come to realize, as some day you will too, that as to some matters relating to our business we see with greater clearness after we are drawn away and become less directly concerned in them, just as our elder statesmen often see clearer, as to things political, than our younger men, whose sense of proportion is thrown off balance by the very keeness of their interest. Youth is intense and draws close to everything with which it concerns itself, and for that very reason may, and often does, see things somewhat out of focus. We "oldsters" on the other hand, push a thing from us to see it clearly, whether it is the page of a book or a fact or a principle of business.

We hear that there is a widespread and growing feeling, maybe some of you share it, that too much new competition is springing up, that too much new capital is flowing into our field, and that the cause is too much education, a too liberal and too wide dissemination of knowledge about the processes, conditions and possibilities of our industry. Well, that is nothing new, it is the oldest bugaboo of business, of all business that has been proved a thing of straw over and over again and laid away, only to be dragged up again whenever weather conditions gave us a bad season or when we experienced other set-backs less easy to explain.

It is even being said now, if I am not misinformed, that all our trade associations are too active in spreading knowledge of our business, and that if we are to continue our meetings at all it should be behind closed doors. It is being said, too, that exhibitions, such as those of the Supply Men and the National Dairy Show, are all wrong because they tend to create competition for us. All that is not new either, it is simply one of the ways in which the same old bugaboo presents itself from time to time.

Looking back, I can recall times when that bugaboo affected me in much the same way that it is affecting some of our friends today. But I know now that I was helped, not hurt; that to dam back the flow of knowledge in those days would have been hurtful and would be as hurtful now.

Let us consider a little the history of our industry since the organization of this Association, which followed closely upon the organization of our National Association. In those days the best of us had but little knowledge of our products and our business compared with what we have today, and of the possibilities of development we really had no realization. We though we had a big industry when it was taken all together; but the output of ten of our leading plants of today will easily match, if not overmatch, the total output of all the plants in the country in that day, and in total output our industry has increased to all of ten times

what it was then. To look back to the comparative crudity of our plants and methods is almost appalling, and I'll not dwell on that subject. In any case, most of you, if not all of you, are as familiar as I am with the improvements and developments from that day to this. All this change in the brief period of 15 or 16 years. You'll agree with me that it is little short of marvelous.

And how did it all come about? Chiefly through the dissemination of knowledge about our industry, which has always been one of the main objects, professed or implied, of all our associations, national and state. Whenever the policy of pursuing that aim has been questioned and looked into, it has always been found that the advantages so far outweighed the disadvantages that the disadvantages counted not at all. Of course, competitors were strengthened in many cases, but it made them better competitors. Equally of course new competition was created, new capital and new blood drawn in. Were any of us hurt, ever? I can't recall a single case. I am absolutely confident that without a single exception we were benefitted, and increasingly benefitted as knowledge increased and was spread about among us. We all grew, some beyond their wildest dreams, in spite of (perhaps in part because of) increased and increasing competition. Competition spurred us, and we went back, and back again to our conventions and our exhibitions, and even to our competitors themselves for the newer knowledge that would enable us not only to meet the most progressive competition, but to continue our own growth.

I doubt that any ice cream manufacturer would say, that any can say, he builded alone, that he got no help from the rest of us. I doubt that any of us can say we gave more than we received of help; indeed, I am sure that we progressed as we have progressed in 15 years only because we all worked for the good of all, contributing each a little and each gaining much.

Out of competition ill-feeling arises some times, and even bitterness. But these pass, and the older we grow the surer we are that they will pass. There remain always the fundamental facts that progress in any industry cannot continue without continuing increase in knowledge nor without a more or less constant inflow of new blood and new capital.

So I say in this, perhaps my last message, continue your seeking for knowledge, continue trading, openly and freely, your little for the aggregate much of your fellow-manufacturers, and put behind you once and for all the bogey of increasing competition. Dam up the stream of knowledge and you will not only slow up your own pace but will invite unintelligent competition. Were I a young man again and making my start I should fear nothing else as much as I should fear unintelligent competition.

You are gathered here today to discuss many topics relating to our industry. About them we still lack something of full knowledge; otherwise your program committee would not have brought them forward. If what I have said helps but a little to stimulate discussion of these topics, to bring out facts known to some of you and hidden to others, then I shall know that my message has gone home. (Applause).

Chairman Crane: I thank you.

Chairman Crane introduces Hon. Jas. Foust, Director of the Bureau of Foods, State of Pennsylvania. Subject, "Difficulties in Enforcing the Pennsylvania Ice Cream Law."

Mr. Foust: Mr. President and Members of the Association: I assure you that I enjoy the privilege of meeting with you again. There are three conventions I always particularly note. One is the Specialty Manufacturers Association, another the Wholesale Grocers Association, and third the Association of Ice Cream Manufacturers. I wish that all the branches of the trade were connected with some organization of this kind. It makes it much easier for any controlling body to administer the laws under its supervision, if every ice cream manufacturer in Pennsylvania belongs to this association. You would be a great help to one another, your industry would grow with leaps and bounds, because, instead of a feeling of jealousy and envy existing in the membership and the trade you would get together in these conventions and get to know each other and become helpful to each other; for when you are helping your competitor in business, you are helping yourself. Those are some of the things we need to think about. These are trying times in which we are now living, in fact people in all conditions I believe, need to know themselves and get real well acquainted with each other. Just now you business men need to watch your accounts as you never watched them before, because this readjustment period is not over. I might say there is a man in our department who is in the ice cream business, who was telling me of some of the accounts he had, one in particular that he was carrying of several thousand dollars,—money that they got for products that he made and sold to them, turned it into cash right away, and have held his money for nearly a year. I said to him, "You need to have someone go into court and ask for a trustee to be appointed to look after and manage your affairs." And I want to say, my friends, there is something to this. If a man isn't worth the money you are trusting him with in representing your goods, you had better not sell him,

An Investment In Futures

THE planning and construction of a Dairy or Ice Cream plant is an important responsibility. When completed it not only represents the initial investment but a daily operative expense. Whether this expense is economical or needlessly wasteful depends upon the general system plan developed before construction work is started. The time to protect yourself against extravagant operative expense is while the plant is being planned—not after construction is started, when every change means additional cost.

Complete information will be given you upon request—without obligation. Isn't it at least worth investigation?

Briefly, the function of

McCormick ARCHITECTURAL and ENGINEERING Service

is to first work out the most economical operating plan and arrangement of equipment adaptable to your particular requirements and property. Second, study out the most economical and durable form of construction consistent with your appropriation. Third, provide you with working plans and specifications together with detailed instructions to your contractor. Fourth, furnish competent supervision by our visiting superintendents for the purpose of seeing to it that the work is not slighted and that all materials are according to specifications. Thus, when your plant is completed it is exactly as you want it and in strict accordance with the plans you approved.

M

and do less business. On the other hand, if a man is worth it, carry him, for of course we have to carry one another. But you can't pay for material and carry people along who are doing business on your money, taking your goods and converting them into money and existing on it.

I will go back to the point where I said I am sorry every ice cream manufacturer is not a member of the association. We would get to know each other, understand each other, tell each other how to make a better product and how to please the people, how to increase the consumption of ice cream; for the best advertisement that any ice cream manufacturer can put out to the world is the quality of the product he makes. I don't care where your factory is, or where the store is. If you make a better product than somebody else, the people will find it, and go there and pay the price to get it.

Since the last meeting I have been in touch with the secretary of your association and the legislative committee, trying to work out some questions we are confronted with, and I think we are now in shape to handle them. I am going to suggest that when the legislature meets again, we amend our ice cream law at one point. It is only a very brief amendment, but will make doubly sure. One question I know is bothering some of you, if not all more or less, is to make it unlawful to manufacture or sell ice cream containing any foreign fat or oils. That is the only thing I can think of that is necessary to be amended and made a part of the ice cream law of this state.

In order to better protect the legitimate ice cream industry, and incidentally the consuming public, (applause) some months ago, while the legislature was in session, I suggested to Mr. — —that he make three grades of ice cream—one a normal ice cream, to be known as No. 1; a second containing ten per cent butterfat and five per cent cocoanut oil, known as No. 2, and a third to be made from skim milk and all cocoanut oil. I suggested we send them out to our chemists, one of them at Erie, one at State College, one at Scranton, and one at Philadelphia and Pittsburgh; and tell them to find out and determine the percentage of butterfat, and if they were in any way adulterated. Dr. LaWall, of Philadelphia, reported the following results from the examination of Nos. 1, 2 and 3:

No. 1, total fat present.....10.42
No. 2, total fat present.....15.41
No. 3, total fat present..... 4.29

I will read you Dr. Treat's letter: "My Dear Mr. Foust: I submit herewith a report on the several samples of ice cream submitted by the —— Ice Cream Co. These samples were received in a very bad state, just before the close of laboratory hours on Saturday, the 7th. I have learned indirectly that neglect of an employee of the postoffice was the cause of the delay. All the samples were badly soured and coagulated, and the container of No. 3 was broken and most of the material lost, and what small amount was retained, was soaked into the paper and walls of the container. Since the fat and the other locals did not with any certainty absorb at the same rate,—that is, in the same proportion, I did not undertake to determine the quantity of fat present in that mixture. Indeed, we had difficulty in securing from it a small amount of the fat for chemical examination, and it was altogether too small to carry out the examination strictly in parallel with No.'s 1 and 2.

All of the samples showed soured curd, and had the odors more or less of sour milk products. In the case of No. 1, it is clear that the fat of this mixture is composed of normal butterfat. Yet, owing to the wide range extracted, by the tone of it, the presence of a small amount of foreign fat is not altogether excluded.

In the case of No. 3, this fat was obtained in a clear, slightly yellowish oil. The refractive index is that of butterfat and palm olive oil, the only other oil having a refractive index lower than butterfat. The quantities of fat were so small that it was impossible to obtain for No. 3 the same quantities as used in the tests for No.'s 1 and 2, only 2½ grains being obtainable. However, it shows that the fatty material used in No. 3 is cocoanut oil, with little or no butterfat, suggesting a proportion of all skim milk products, and some stiffening agent or agents.

In the case of No. 2, the fat had little more color than No. 3. It was not, however, brown by the action of acid. It had some slight butter odor, but not nearly so marked as in the case of No. 1. The question naturally arises, what foreign fat, added to butterfat, would tend to produce the qualities determined in the case of No. 2. The only fat whose presence would produce the changes of this character in certain indexed numbers is cocoanut oil, and I come then to the conclusion that No. 2 is a mixture of butterfat and cocoanut oil. When I come to figure out the quantity in which cocoanut oil has been added to the butterfat my data does not bring me to identically the same conclusions. The properties are so similar it is impossible, and the only way we can proceed is by the method of approximation."

NOTE—The figures and technical analysis given in the letter are here omitted.

Mr. Foust: I think we get this out of the report: first, that all of the mixtures were sour; second, that

some of them possessed undesirable odors; third, that in the case of some of the fats, when the chemical analysis is applied, it doesn't determine the exact proportions in which they art present in the mixture,—that is, the proportion in which cocoanut oil is mixed with butterfat. He does determine, however, that in one case there is butterfat, in another there is less, and in the third very little. Other cases than that of Dr. Treat, of State College, were approximately the same: No. 1 being normal, No. 2 was ⅔ butterfat and ⅓ cocoanut oil, No. 3 was skim milk and cocoanut oil. There is no question but we can determine them without any doubt whatever; but to separate the fats and determine the proportions is not an easy thing for a chemist to determine. That will not be necessary if you will just put an amendment to our ice cream law, that it shall not contain any foreign fat, when we will only have to determine its presence. Now, we have to determine the percentage of butterfat,—it must have a fixed amount of butterfat. So far as any other fat is concerned, just where we would be at I am not prepared to say. It must have the legal amount of butterfat fixed by the Act in order to make it lawful to sell. Therefore, under our present law, they can't sell it unless they put in over and above the amount of butterfat finished ice cream must have. I don't think we need have any fear of trouble until the next legislature meets, then I think the legislature ought to be instructed to amend this law upon the one point,—prohibiting the manufacture and sale of ice cream in Pennsylvania if it contains any foreign fat or oil. That, to my mind, would make our law stronger, easier for our chemists, and easier to prove in court. We would not have to separate and determine the quantities of butterfat and cocoanut oil or any other oil that might be used. We have this summer, as well as last summer, been watching this very closely in the Middle West, where they have been using it some; and I have reports,—only reports,—that in some of the New England states it has been used some, but we have not found any in Pennsylvania, containing foreign fats or oils, although we have been looking for it ever since we learned that cocoanut oil was being so extensively used for so many purposes in connection with by-products of all sorts. Cocoanut oil, as a matter of fact, is one of the things used in the manufacture of oleomargarine, also many other food purposes; and we don't want it to get into our ice cream or our milk products. We have three laws we need to strengthen and make a little more specific, so as to make them easier to enforce, easier for our experts, and better, of course, all round for the consuming public.

Forty years ago, the ice cream industry was very small, and ice cream was eaten two or three months in the year by the classes. It is now an every-day diet, and eaten every day by the masses. So when we think of the ice cream industry in this country, representing one hundred fifty million dollars, just think where it is going to go to, when this country gets **real bone dry.** There is going to be more ice cream eaten, people are going to have more money to buy ice cream with for their families and themselves, we are going to be a better people, and the ice cream business is going to grow with leaps and bounds. Then your industry will not represent one hundred fifty million dollars, but will represent many times that amount. It is really in its infancy yet. So it is up to the ice cream manufacturers, by standing together, using the help of each other and the co-operation of each other, to continue as you have in the past to improve the quality of your product. As a result, no one can tell but that instead of being eaten for dessert at dinner, people will start to eat ice cream for breakfast, and, indeed, three times a day. (Applause).

I want to say, Mr. President, and members of the association, I am glad to be here today, and if there is any question or any problem confronting you in which I can help you where I have the tools to work with, help you to push your business ahead, make your product better, help you in your trade problems or in any way, I want you to be perfectly frank right here and now to state some of them. I am here to co-operate with you and want every one of you to co-operate with me. If you know anybody selling ice cream that you think don't meet the requirements of the law. Drop me a note,—we will be very glad to have it. This is a very large state, and ice cream is sold in thousands of places. We don't have many men to go out and apprehend all who are not complying with the law, but we do the best we can with the number of men available; so any information you can give, any assistance you can render, I assure you I will do all I can to see that our law is enforced and its provisions respected by everyone connected with the trade. While I am doing that, I am also protecting the consuming public of over eight and a half million people here. That is what the law is for, the protection of the people, but while we are protecting them, we are also protecting the industry, so if there is any branch of the industry not complying with this law, then it is our duty to see that it complies with the law and to enforce the penalty of the law in the regular way and through the proper channel.

If there is anyone who desires to ask questions, I will be very glad to answer. (Applause). One ques-

tion that comes to me,—how much should a freezer of ice cream vary if a test is made, from the bottom of a two gallon freezer of cream, that your retail dealer is selling out of? Say you take a pint out of the bottom, a pint out of the middle and a pint out of the top,—how much will it vary. I have been going into that somewhat, and I am confused myself. Unless someone can show me I am wrong, with proper mixing in the factory, that mixture when frozen, will not vary one per cent in butterfat. Does anyone take exception?

Mr. W. E. Hoffman (Tyrone): We don't know exactly the amount, but it varies greatly. Every test we make seems to differ. I notice in reading the reports of Dr. Lawall and Dr. Freer that there is a difference of two per cent in butterfat in those samples as between the two analyses. Now, these are samples taken at the same time I suppose, and if they vary, they show what will happen.

Mr. Foust: I will say this, I trust you will bear in mind these were samples taken and sent Thursday, and that it was a mixture not frozen, and they never got the mixture until Saturday. Then again, as I said, to separate the fats and determine the proportions, is quite different from determining that nothing but butterfat is present. So there is no question but that butterfat can be very accurately determined, but where you mix butterfat and some other fat, is not so easy to determine the proportion of each. Now, I have talked to our chemists about it, and there is much of interest entering into it. Suppose you sell a freezer of ice cream which eventually melts, and you bring it back and re-freeze it. That is bad practice, and ought not to be done. I don't believe any member of the association would do that, but there are some people in the industry who possibly do that, and that will make a difference.

I don't know what your system is of filling the cans, but if always well mixed when you do your freezing, and the mixture well above our standard, there is no danger of any trouble from the top, middle or bottom of the freezer varying to any extent as to butterfat content.

Chairman Crane: You will remember the meeting in Harrisburg, when we were there to frame that bill, and get down to a standard, President Pierce told us it would take forty gallons to determine the exact amount of butterfat.

Mr. Foust: I don't remember that.

Chairman Crane: Acting on your suggestion, I will appoint the following Legislative Committee: S. S. Robertson, chairman; James W. Neuman, Thomas Hall, W. E. Hoffman.

Chairman Crane introduces Ex-Mayor W. J. Stern, secretary of the Wholesale Credit Mens' Association of Erie.

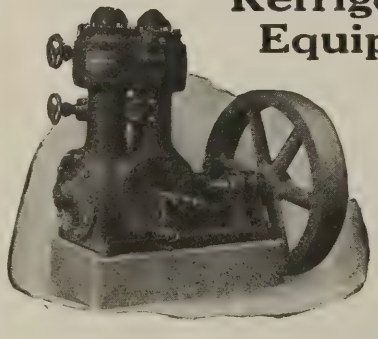
Mr. Stern: A few days ago I was called by a friend of mine saying, "I want you to come over Monday or Tuesday, and talk about our credit association in Erie. I told him I would, and now I haven't had a chance to think about it since that time. Your president wanted me to speak on the several articles which he had marked in that report. I haven't had a chance to look over it, and will have to glance at it.

When I stand on the corner and see the trucks of ice cream go by I think of the wonderful strides in this industry. I don't think I am so very old, but thirty-five years ago, when we used to buy ice cream for the girls it was a great treat, and a fellow who earned five or six dollars a week, if he could afford to take her out and buy her a fifteen cent dish of ice cream, was doing well.

I remember Franklin's, colored family, had a place on West 6th street, where the Erie Club now stands. They charged fifteen cents, and if a fellow had any money he went to Franklin's and thought he was the whole thing in doing it.

In traveling around, I see the empty ice cream cans and I thinkit remarkable how they have gone about specializing and have built up a wonderful industry. That is only one phase of it,—another is that twenty-two million gallons have been made in Pennsylvania to October of last year and thirty-five million dollars invested in the industry. When I was a boy I don't suppose there was two hundred thousand dollars invested in it in Pennsylvania.

Some firm in Erie advertises "Eat a Plate of Ice Cream Every Day." I think many people in Erie eat ice cream every day. I was reading an article in some magazine about the prohibition question. The article was rather neutral,—spoke about the effects of alcohol in the system, and then went on to say that possibly people were eating too many sweet things, too much ice cream and confectionery and making their own alcohol. I hope you won't have the same trouble. We have got to have some vent, you know.



About this credit business, I don't think it is generally known just how great our state of Pennsylvania is. Here are two hundred people here today representing a great industry, a new industry you might say. I don't think the people are conscious of what this means, or what we have in Pennsylvania. They would not even give a second thought to it as an agricultural state, although it ranks third in agriculture. Just think what a help you are to those farmers, think what it

means to those dairies,—the ice cream you make for the people. The forests of forty years ago are cut down, and you find herds of cattle where those forests used to be, and the farmers building up a nice industry in the dairy business. I want to say this is a great thing for the people, and a great thing for the state.

Here in Erie we have a Wholesale Credit Mens' Association. In that, or will be, every wholesale dealer in all lines in the city of Erie. Now, these men have thought of such an association for years, have met once a month and talked things over in a way,—the people to whom they were selling goods, some would write letters, which the secretary would read, and somebody say, "He is good" or "He is slow" or "He pays me every month." There was no general report of any kind. Now, the wholesale dealers of Erie are determined upon having a proper system of giving credit. They want to ascertain first of all "How much does everybody owe they sell to?" That is, after all, the key to the whole thing. When you are selling goods, you can better determine whether you should sell a man if you know what he owes. So we are doing this now, establishing a system in our office by which every dealer in Erie who belongs to the association,—and I hope every dealer will belong,—will get a report on the first day of November, giving the names of all the customers in Erie and contiguous territory, telling what each customer owes. We will list the parties name and address, and there will be twelve divisions, so that for each month in the year will be an account of what the debtor owes to the trade. Each member of our association will have a key number and we will put down according ao key number what each party owes on the first day of November and what jobber, so we will know what each dealer in Erie owes to the different jobbing concerns in the city of Erie. We believe that is the basis of all credit,—what a man owes and how he stands financially.

To give an illustration of how little a debtor knows as to what he owes, I went to a store two weeks ago, and said, "I am representing the Wholesale Credit Mens' Association of Erie, and have come here to ask you a few questions. First of all, "What do you owe?" He said, "About $800." I said, "If I told you a party has $1,610 against you, would you believe it?" He said, "Oh my, no." I said, "You certainly do, you owe $1,610." Before we got through, I found he owed $2,000, when he thought he owed $800. Now that fellow is actually insolvent and didn't know it, nor did the wholesalers of Erie.

Another case: I asked a man what he owed, and he said, $2,600. I said, "I have a bill against you for $4,000," and when I got through that man I ascertained owed $6,800 when he thought he owed $2,600. Now, we believe that where you find a man is slow pay, or not paying his bills, if you call our office and ascertain what that man owes, you will know in future whether to keep him on your books. That is the most important thing, and where such a man goes out, the quicker the better.

Now you may say "We can't have this correct, that there is a lack of honor." I told the members that I wanted an exact statement of what debtors owed each month, and I would give that information right from the office. All this will mean a tremendous responsibility when you stop to think there are about 60 or 70 jobbers of all kinds in the city of Erie, each one of them having a line of customers; and a tremendous amount of work to have in our office. Yet, it will be worked out with much benefit to the trade.

I don't know how you handle your collections, but I say you can't be too careful. We have passed through such a period of prosperity, with people living way beyond their means, many of them are very indifferent about how they stand,—in fact I believe two-thirds of them don't know how they do stand. For instance, a fellow saves up two or three hundred, and the first thing you know he buys an automobile and has a pretty good time. He moves into a more expensive place, buys a lot of fancy things, and the consequences is that today all these fellows are running behind in their bills, and are using the creditors to carry them. I believe we are going to have great results by this system we are installing. Surely it will be a place of turning, for how much better our dealers will feel when starting credit, they can call our office and find out how much a party owes.

We expect also to size up business conditions, and make a report as we see these conditions. We are going to try it all out here, and if I should be so fortunate as to live another year, and you so fortunate as to come back to Erie another year, and my friends invite me to speak again, I may be able to tell you a lot more of how this thing can be worked out. I believe that this system of ours will save its patrons many thousands of dollars every year, besides doing away with a great many cases where they have been working in the dark. First of all in my estimation, it is a matter of whether a man is entitled to credit. If a man is absolutely solvent and of good reputation, has money back of him, and is worthy of credit, well and good. On the other hand, if he is slow pay, he wants to be looked after very carefully.

I don't know as there is anything else to say other than we are going to work hard to bring this into a successful work. I am glad to have had the oppor-

tunity to come here this afternoon. I appreciate for the City of Erie what a convention of this kind means.

Chairman Crane: The Chair has to announce for the next part of the program an open discussion of the printed collection system, and while we have Mr. Stern here, perhaps he can suggest something, so we will open the topic.

Mr. Stern: I will be glad to stay and answer any questions.

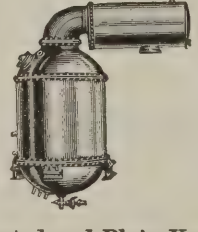
Mr. O. S. Jordan (New York): What is your idea on the moral credit question? You know, when you go to a bank to borrow money, there is a certain element taken into consideration, that is,— just a moral credit, or moral risk?

Mr. Stern: I think there is a whole lot in that, and will answer this way—a man who makes a good moral risk is usually a very desirable customer. In fact, some of our very best men started in a very small way, young men of excellent habits, great industry, and having very little money, and yet they have been worthy of being helped. A young man as a rule, will always know what he owes, and keeps track of his bills, because he knows the only way to get credit is to pay his bills. He is always watching his business and he keeps his books and accounts in proper shape and is always attending to business. He doesn't spend more than he takes in. That fellow is a mighty good risk. You go to his place of business and see this fellow working hard, and his wife working hard with him. Such a fellow usually pays his bills and will succeed where the fellow who has no morals or reputation will go under. Does that answer the question?

Mr. Jordan: It does in a measure. I will quote a man in the insurance business,—the New York Life. He said that where they had preferred risks, and where several men were examined, if he were to stand on Broadway and take every thousandth man that came along, those would be a better risk than the investigations they had. In my experience I have found that the moral risk has been better than Bradstreet.

Another case you exemplified of where a man keeps his place of business in good order. Yet, you have got to know your man, for if you rely absolutely on credit information, you are following a shadow.

Mr. Stern: Let me say this, that the moral risk you mention is a great factor up to a certain point. You know that if a man has some basis for credit, owns property and has money, that he is generally a safer risk than the man upon whose honesty you depend. Some times that man, who is a very good moral risk, becomes unfortunate. He intends to pay, but can't pay, and has nothing back of him. I would say the moral risk is a great factor in the extension of credit, but should be carried only to a certain point. If a man has nothing, has a few bills, but is paying them, he is entitled to a short line of credit, because something might happen that he can't forsee. A man who has property or something back of him, if anything happens, he can be made to pay. I think in dealing with anybody, you ought to consider the moral feature. It is a great factor, and as such must be considered.



Chairman Crane: You all know that every circus has a side show, so as a side show, I want to call on the manager of this side show, Mr. Jordan.

Mr. O. S. Jordan (President Association of Ice Cream Supply Men): I notice that I was billed here to extend an invitation to visit the display of the Association of Ice Cream Supply Men. It has been impressed upon my mind what does a man mean who ostensibly goes to the convention and yet doesn't come to the meetings. Between the remarks of Mr. Stern and Mr. Foust, if you stop to think, will show you the broad minded manner in which they look at things. Mr. Robertson mentioned something which I understood referred to inviting competition. Take in the history of your own business, whenever there was excessive competition, or what you deemed excessive competition, that was the stimulation of your industry. You found that you did just as much business, if not more, than the other fellow, or did most as much. Now that the Association of Ice Cream Supply Men are allied with the Pennsylvania Association, never in the history of any line of business was there a better example of friendship, understanding and co-operation between buyer and seller, for the ice cream manufacturers realize they are sellers as well as buyers. So we have dovetailed in to the extent we are one great brotherhood.

The Association of Ice Cream Supply Men welcome you, gentlemen, to Buffalo. We are in Buffalo with one of the greatest shows, one of the greatest exhibits, something that will dignify the ice cream industry. Men like myself, who were associated with the industry thirty years ago, when it grew up from a little hand machine, realize the importance of the industry, and our part is to dignify it. When the New York Tribune will come out with a half page devoted to the ice cream industry you men must understand you are being brought to a point where if you don't have co-operation, if you don't have this feeling, it will take fifty years to do it.

With the spirit of co-operation in mind, I want all of you when you adjourn, when you have finished entertaining or enjoying the hospitality of Erie peaple, knowing as I do that they will more than go the limit

"In Every Instance the Control Responded"

MORGAN & WRIGHT
DETROIT RUBBER WORKS
MAKERS OF
UNITED STATES TIRES
DETROIT, MICH. December 1, 1920

Refrigerating Specialties Company,
Mr. Troy L. Parker,
9 South Clinton St.,
Chicago, Ill.

Gentlemen—

We are in receipt of your communication of November 26th, with reference to a Monogram Automatic Pressure Control.

In this connection we wish to advise that the Monogram equipment has been installed on our machine for two seasons now, with satisfactory results. There were only two or three occasions where the pressure got sufficiently high to operate the Control, but in every instance the Control responded.

We trust this will give you the desired information.

Yours very truly,
MORGAN & WRIGHT
Supt. Power & Machinery

JHM:AMC.

That tells the story and thats why you should have a *Monogram* Pressure Control on your refrigerating equipment which will "respond in every instance" when ammonia condensing pressure gets too high.

For information, which we are glad to furnish, without any obligation on your part; mail us the attached data coupon.

REFRIGERATING SPECIALTIES COMPANY,
9 South Clinton St., Chicago, Ill.

Gentlemen: I want absolute protection against dangerously high ammonia pressure in my refrigerating equipment. I have a.....H. P., ...phase, ...cycle, ...Volt, A. C. or D. C. Motor, operating a ..... ton compressor. Don't bother me with a salesman, but quote what your system of safeguarding my plant will cost.

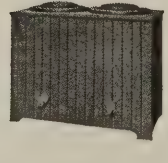
Yours truly,

Name .....

Address .....

City ..... State.....

being one of the finest bunches in this country, (applause) come with us to Buffalo. While there has been rather a misconception of the time this meeting was to adjourn, from the circular, we thinking it would be over at 12 o'clock noon tomorrow, so as to have all of you gentlemen adjourn to Buffalo and get there at 6:25, we understand that there is to be something of an entertainment tomorrow afternoon, and plans made so that you will get into Buffalo at 9 p. m. It doesn't make any difference whether you get there at 6 or 9 o'clock so far as the Supply Men are concerned,—they will be at the depot to welcome you and the gates are wide open. Tomorrow night a stag and smoker was planned, with a theater party for the ladies. On Wednesday, through the courtesy of the Buffalo ice cream manufacturers, the ladies will be entertained by a drive through Buffalo, and there will be a special movie picture shown, and a dance afterwards. On Thursday will be a dinner, an absolutely clean vaudeville and winding up with a dance.



I will say we have one of the most beautiful displays, more varified and more of them than we have ever had before; and as President of the supply men, and by invitation of the president and secretary of the association, I welcome you, and assure you that it will be one to be remembered. (Applause).

Mr. Hoeffler (Hoeffler Ice Cream Co., Buffalo,): I want to follow for just a trifle, what Mr. Jordan has said. I was fairly amazed yesterday afternoon at my first visit to Music Hall to see the wonderful exhibit they have ready for you. It is something that eclipses anything that has ever been put before us, and anyone who doesn't go to Buffalo for that purpose alone is going to miss a treat.

Schroeder Perfection Cabinets

Take an Inventory of your cabinets today - and know your requirements for 1922.

"Insulation is the thing"

JOHN SCHROEDER LUMBER CO.

"A Dozen Cabinets or a Dozen Carloads"

WALNUT ST. --- MILWAUKEE, WIS.

So far as the entertainment features are concerned, the manufacturers of the city will of course, do their best, but there is very little left for us to do, as the program of the supply men is so varied, something doing every minute, that I trust you will come in a body.

Chairman Crane: We have to get out at a certain time, and I want to appoint some committees, and I want them to get together and report at the beginning of tomorrow's meeting. I will appoint

On Resolutions: Hon. S. S. Robertson, B. R. Walker, Wm. H. Duff.

On Auditing: W. H. List, Jr., D. E. Wiseman, Geo. Brink.

On Nomination of Directors: M. D. Hoffman, Clark Dixon, Calvin Leichtman.

It will be up to this committee to elect somebody to take my place, as I have now been with you fifteen years.

Adjournment to 9:30 Tuesday morning, November 1, 1921.

* * *

MORNING SESSION, 9:30, NOV. 1, 1921.

Secretary's Report (J. W. Neuman, York, Pa.)

New active members since last meeting: Penn Ice Cream Co., Glenside, Pa.; B. Lascaris, Union City, Pa.; The Perfection Dairy Co., Kent, Ohio; Puritan Ice Cream Co., Newark, N. J.; C. A. Tharp & Son, Shamokin, Pa.; Yoenglings Ice Cream, Pottsville, Pa.

New associate members since last meeting: Arbuckle Bros., Pittsburgh, Pa.; Keystone Fruit products Co., Cincinatti, Ohio; Menasha Printing & Carton Co., Menasha, Wis.; Parker Vanilla Products Co., Baltimore, Md.; B. L. Roman & Co., Canton, Ohio; Frank A. Smith, Harrisburg, Pa.; Bellville Condensed Milk Co., Bellville, Pa.; Solar-Sturges Mfg. Co., Columbus, Ohio; Orange Crush Co., Chicago, Ill.; Bryan-Duvall Co., Inc., New York.

Resignations received during 1921: Pennsylvania Chocolate Co., J. L. Westbrook, J. H. Huston Company, Inc., French Bros. & Bauer, Widlar Co., Cleveland, O.

Reports of the Secretary and Treasurer were read and approved.

Chairman Crane introduces Thomas Hall, of Russ Bros., Harrisburg, who talks upon the subject of "Microscopic and Thermal Analysis of the Texture of Ice Cream."

NOTE—Mr. Hall's paper, which he read in connection with an enlarged chart, was not handed in for the minutes, as it was necessary to revise it before doing so. Mr. Hall arranged to send this paper on direct to the journal. He closed his paper with the applause of the association.

Howard A. Hartzell (Easton, Pa.): I think the thanks of the association ought to be extended to Mr. Hall for that very able talk. I move a rising vote of thanks be given him.

Chairman Crane: The motion is before the house, that a rising vote of thanks be given Mr. Hall. Motion seconded, and unanimously carried.

Report of Directors.

(Read by W. E. Hoffman, of Tyrone, Pa.)

Mr. President, and Members of the Association: Your Board of Directors met for organization at Atlantic City, immediately after the convention adjourned, and elected all the old officers.

November, 1920, the Board met in Philadelphia to take steps to prevent unfavorable legislation. On motion, the President was directed to appoint a committee

to look after same. Messrs. Neuman, Hall and Hoffman were appointed.

The committee met January 6, 1921, with the Pennsylvania Dairy Council and the Ice Cream Manufacturers' Association to frame a bill prohibiting the use of foreign fats in milk, cream and ice cream. The bill was introduced by Representative Cook, and passed the House. Your committee attended the hearing before the Senate committee, April 7th, 1921, but unfortunately the bill was killed by that committee. A bill covering the same points has been introduced in Congress, and we hope to have a national law passed that will take this product off the market.

The board met in Philadelphia to select a place of meeting. Altoona and Erie were considered, and Erie was selected and the dates Oct. 31 and Nov. 1 fixed, so that we could attend the Supply Men's show at Buffalo the same week. Messrs. Walker, Neuman and Hoffman were appointed a committee to go to Erie and make the necessary arrangements.

The committee came to Erie Sept. 10th, and, in conjunction with the members here, arranged for this convention.

Messrs. Reick, Neuman and Hoffman attended the National Convention at Minneapolis, and, following the lead of the National Association strongly recommended a resolution condemning the use of foreign fats, and that this association give all the assistance in its power to the proper authorities, in prosecuting any person or firm discovered using the same.

Chairman Crane: What do you want done with this report?

Motion it be accepted, and seconded. Motion carried, and report ordered filed.

Committee on Nominations Reports.

(Mr. M. D. Huffman.)

The following members have been nominated to serve as Directors for the coming year:

W. H. List, Jr., Newark, N. J.; Robert Crane, Philadelphia; E. Walker, Warren; Harry Breyer, Philadelphia; Howard A. Hartzell, Easton; W. E. Hoffman, Tyrone; J. W. Neuman, York; E. E. Rieck, Pittsburgh; F. M. Slater, Sharpsburg.

Chairman Crane: What shall be done with this?

Mr. Rieck (Pittsburgh): Moves that the Secretary cast one ballot, which motion was duly seconded, and carried.

Hon. S. S. Robertson: On every occasion where a convention has been held, it has always been helped out by local men in the particular place where the convention was held. I don't remember a single occasion, however, in which such extraordinary exertions were put forth, as has been done in this case of our visit to Erie.

First, I am told that there was an organization of the local men here, who, sinking all their differences, if they had any, united in a common effort to make the visiting members of the association welcome to Erie. They met us at the station as you know, looked after our accommodations before we came here, and then they brought their influence to bear upon the Mayor and other good citizens of the city to join in the welcome which they had prepared for us; and last night they furnished a magnificent banquet at great expense, to which they not only invited members of the association, but their families. All this without regard to the trouble involved in preparing it, or without regard to the cost of the entertainment.

So it has been thought proper that we should extend to these gentlemen a vote of thanks for their great generosity, and for the pains to which they put themselves to make our entertainment here, and this convention an overwhelming success, as it has been. I therefore move you, Mr. Chairman, that a rising vote of thanks be extended to the gentlemen and the companies in question.

Chairman Crane: What shall we do with this motion?

Motion seconded, and unanimously carried with applause.

Chairman Crane: Introduces Mr. Wm. White, of the Grove City Creamery, Grove City, Pa., subject, "Possibilities of Building Milk Supply in Small Dairying Community."

Mr. White: Mr. President, and Members of the Association: From some of the conversation I have heard around the convention, I think more people are interested in the subject of disposing of the surplus product. However, it is up to me to talk on the possibility of providing more raw material, and in doing so I am not going to discuss the various possibilities applicable to your location, but will relate what has been done in Grove City.

Prior to the establishment of the creamery at Grove City, in May, 1915, the rural community round there was somewhat backward, and not very prosperous. There were a few cows there, but very poor—in fact, as a whole, would be classed as scrubs. When the creamery was established in May, 1915, many of the farmers were skeptical about patronizing it, and during the first month of its operation only fifty-four brought milk or cream to the plant. However, each

month showed more patrons, and before the end of the first year the number of patrons had increased to 380.

The Dairy Division of the United States Department of Agriculture had a decided conviction that in a community where there was a good market for milk and cream, and where the natural conditions favored dairying, a field man would greatly stimulate and put real life into the dairying community, and here the farmers were not producing any one group, and the taxes and income on the farm were very low, it seemed that this community would be an ideal location, and they transferred one of their experienced field men to Grove City.

When he arrived and looked over the field, he found very little indication of scientific dairying. He first realized that one of the things needed would be better cows. I have already mentioned that most of those there were scrubs. There were two ways of going about this—either purchase them, or make an effort to get a few good cows in there and breed good stock. To have a few good cows would be a good thing, so that the rest of the community could see what a good cow was. So he talked good cows to the farmers, but they said they had no money to spend on dairy stock. They went to a banker, a gentleman interested in the establishment of the creamery, and talked good cows to him. This banker was a man of vision who saw the possibilities of developing good business for himself, right at home, and at the same time assist the farmers in developing their dairy stock. Arrangements were therefore made where by th bank was to loan money to the farmers on their personal note, but only for the purchase of cows. When the first cows were brought in, the bank arranged to have one cow go to a farm, and this proved a very good plan. So these first farmers each got a real good cow, pure bred, which he took home, feeling that he had an aristocrat of the dairy family. Naturally, that good cow, which he had paid good money for, got the best stall, the best feed and the best care; and quite as naturally the cow responded to that treatment and produced well. So the farmer was thoroughly sold on good cows, and wanted more. More cows were brought in—carload after carload, and eventually the farmers became convinced that their scrubs should be disposed of and be replaced with good cows.

With a good cow, it is necessary to have a good bull, so the subject of bulls came up. The farmers didn't feel like coming across individually with the money to buy good bulls—couldn't afford it. So the plan was resorted to which has been followed in a good many communities, that of forming a bull association. Some thirty farmers in Grove City were interested in Holsteins, all having a few, or wanting some. These were divided into four blocks, each farmer subscribing $75, which made the fund sufficiently large to purchase four very good Holstein bulls, one being placed in each block, where the 6, 7 and 8 farmers in the block could use this one bull on their entire herd, whether purebred or not. After two years, the bulls were changd round to prevent in-breeding, and at the end of another two years were again changed. Thus on an initial expenditure of $75, these 25 or 30 farmers have used a very good sire for eight years.

A Jersey Bull Association was also formed on the same plan as the Holstein association. Naturally, the question comes up, "How good are these cows—how are they doing?" To answer that question a cow testing association was formed, with which you are probably all familiar. The test has been one day per month at each farm, where the milk is weighed from each cow for two milkings, and that one day test taken as an average for the month. At the end of the first year, the average test on the production per cow for the year was 5,000 lbs. of milk and 225 lbs. of butterfat. This association has just completed its fourth year, and the average per cow for the fourth year was 6,300 lbs. of milk and 300 lbs. of butterfat. This increased production per cow per year, compared with the rate of production for the first year, shows that the same number of cows produced twenty thousand dollars worth of milk more than the first year. During the first year only five herds churned 300 pounds of butterfat per cow, but the fourth year eighteen herds churned 300 pounds of butterfat per cow, per year. During the first year only eleven cows exceeded 400 pounds of butterfat, but last year 42 cows exceeded that. Results like that make the farmer see the dollars and cents of it, and they are therefore sold on this question of good cows, not only from the standpoint of milk production, but also from the standpoint of the profit to be made from raising and selling good stock. One farmer bought a purebred cow when the second carload came in, paying $225 for her. He had that cow for four years, bred to a purebred bull, selling her and her offspring for $1,425. During that time, he was of course getting milk from the cow, and perhaps one of her heifers. Another farmer brought in Jerseys, a bull and five cows, paying $3,000 for them. His health failed him recently, and he sold these cows, with their offspring, for $7,000. So the farmers around Grove City are strong for purebred stock.

Another thing that was done to stimulate interest along the idea of increasing production was to interest the boys and girls on the farms in good calves. The field man, through the co-operation of the local banker, established a calf club, the banker financing it, so that boys and girls on the farms bought purebred stock, and

joined the calf club. They took home their calves, very proud of the fact, as all farm boys and girls are especially proud of anything they can call their own. When these were of breeding age, they were bred to purebred bulls, and pretty soon these members of the calf club had producing cows, and calves from those cows. In a great many instances, the interest of the boy or girl in purebred stock caused the farmer himself to become interested, whereupon he would turn his herd into high producers. In one case a man had a very poor herd of scrubs. He had two sons who had joined the calf club, and after these calves got to the breeding age, this farmer came to the field man and told him he wanted those heifers bred to the best bull that was available. The field man recommended a certain bull to this farmer who had kept nothing but scrubs, and who paid a service fee of fifty dollars for each of those heifers to be bred to this fine bull. That farmer is today developing into one of the progressive farmers of the community, and is a producer of purebred stock, which all started with those boys joining the calf club. Of course this development on the farms has been noted by increased receipts of milk and cream at the creamery. During the first year of its operation the butterfat received ran a little over 150,000 pounds, and last year nearly reached 600,000 pounds. During the first year only 183,000 pounds of milk were received, but later an addition was made to the plant, and arrangements made for the manufacture of cheese. The new addition provided more than the original floor space, and last year 6,000,000 pounds of milk were received—an increase of several hundred per cent.

This field man stationed there by the Dairy Division was there only two years, when he left to go to another and bigger field. After he had been gone for a few months the people in the community began to feel his loss, and realized that they couldn't afford to be without a field man, so arrangements were made to get a field man on the job again. The farmers didn't feel able to carry it themselves, but with the assistance of the creamery and the Commercial Club, they employed a field man, who, by the way, is the one originally sent, so things are once more going ahead at full speed.

In developing dairying at Grove City it was felt desirable to have the herds tuberculin tested, and over half have had their herds tested and accredited as being tuberculin free according to the plan of the state and federal departments. This accredited herd association, which has been formed and had their herds tested, also includes in its program the sale of surplus dairy stock. Every year, for the past five years about, this association, together with the creamery. has held a dairy show. This last year at the show were 305 purebred tuberculin tested dairy animals shown. Some five thousand people attended this little exhibition.

Because of the fact that the creamery was in the town, and is the scene around which the development is taking place, and because of the fact that every man had his residence in the town, as was also the banker, the farmers have become affiliated with the town more closely than before. Also because of this dairy development the farmers have been getting a check from the creamery once a month, so that they have had more money to spend, and the merchants report that the farmers have bought more and better merchandise, paying for their purchases with cash instead of asking for credit. The town is strong for development, because every business man is profiting by it, and the banker has increased his deposits within the last five years by a million dollars, one-half of that being in the hands of the farmers.

The Commercial Club of Grove City are a good, live bunch, and they have taken a great interest in developing the dairying round there; also have invited the farmers to become members. Now fifty are members, some of them very active. The Ladies' Auxiliary of the Commercial Club, known as the Women's Civic League, also has a good many members who take an active part. So the development of the dairy business has brought the farmer into town and taken the town interests out to the farmer, all of which is developing a community spirit. Anything to be done in connection with farm development is entered into by more than the farmers, in fact the whole town. In preparing the dairy show, for instance, there were two clean-up days, and the business men of the town went out and helped the farmers prepare the grounds. This association has purchased five acres of ground as a permanent home, and as soon as circumstances will permit, will erect a pavillion.

What has been done in Grove City is a matter of co-operation between the farmer, the merchant and the banker. It would appear that something could be accomplished in any community where there is a good market for dairy products, and where the people are willing to co-operate and push the proposition. (Applause.)

Chairman Crane: Is this creamery co-operative?

Mr. White: It is owned mostly by stockholders in town. There are some farmers that own stock.

Chairman Crane: The government is not interested?

Mr. White: The government has a 15-year agreement with that creamery and in that agreement it provides for supervising the operation of the plant, and a certain part of the building is used by the operating division for investigating the work. Several men are stationed there. The government doesn't own the plant, or put any money into it.

Chairman Crane: Is a certain amount of the expense borne by the government?

Mr. White: No, the only money the government pays to the creamery is the equivalent of the rental for the part their department uses. They have laboratories, and an experimental creamery room.

Mr. Robertson: Did the government do something in the way of assisting in the beginning?

Mr. White: The government started it, yes. It was at the request of the government, and with the agreement that the government should supervise the operation of the plant, that the thing was started.

Mr. Robertson: The point was, it wasn't financed by the people?

Mr. White: No, the government started it because they wanted a place to do investigation work on a commercial scale,

Chairman Crane: If some of us wanted to do likewise, is there such an opportunity?

Mr. White: That would not be the case, because the government needs only one plant for investigation work.

Chairman Crane: Calls upon J. L. Shoemacher, of the Crane Ice Cream Co., Philadelphia, who addresses the conventnon as follows:

Mr. Shoemacher: Mr. President, Friends and Fellow Members: First, I want to thank all the kind friends who helped me search for my hat last evening. I have to announce that I found it this morning.

One of the beatitudes is "blessed is the man who makes short speeches, for he shall be asked again," so I will not attempt to make any formal talk, but will just

pass on to you a few thoughts now going through my mind.

I wonder if you realize what this association means —what this industry means to the country. Every big industry passes through three stages—first, development; second, competition; third, co-operation. There are many men in this room who have seen this business from its inception, and who can remember the time when the ice cream soda brought ice cream before the people as a cheap article of food; and they can remember when the ice cream cone further popularized it. We are now searching for something else to further extend its popularity.

I know some of you have come to this convention, and have asked yourselves, "what does this Pennsylvania convention mean to me?" It means to you and to me just exactly what you put in and what you give it. Your officers, your directors, can't make this association. This association is just as big as the individual members in the industry make it; and I can say to you in all seriousness that the growth of any industry in this country has been measured by the strength of its association. Possibly the biggest example before us is the California Fruit Growers' Association. I trust and hope this industry will not have to be brought together for the same reason as was that. You know there is nothing that brings a family or community together like trouble or death. Brothers who have been estranged for years will be united, and the same thing over in Dayton, Ohio, will save Patterson from the penitentiary, and make him a benefactor. It was trouble that brought the California Fruit Growers together—they had to stick together or see the industry go by the board. We have an industry here, developed like that was, by co-operation and competition. If there is any message we should take from these splendid topics, it seems to me to be this—that this industry is today in competition, and that it remains with us as men in the business to determine how long it is going to be before we come into such co-operation. What advantage is it to the industry if I take a customer from a competitor; what advantage is it if I get other people to use ice cream who have used it before? What advantage if I devise some new way of selling or distributing if I cannot devise new methods and new uses for ice cream?

I wish I had the brains to be able to determine what the next development of this industry will be. I firmly believe that something will come along in the next year or two. As during the days of the Centennial in Philadelphia, when ice cream was made popular, we hear a lot today about that word **service.** I don't care what your relations or politics are, you look up and worship some man whose life has meant service to the world,—some man who as a stellar light, has in history rendered something to their fellow men. If you go to the bottom of your heart, you will find there is one thing we are striving for,—business; and the keynote of business is service. The more you give, the more you get; and the more you take away from somebody else, the less you get.

For countless centuries men have been fighting one another,—from the time of stones and clubs until they have got to this miserable poison gas of the war; and we can point out men who have built their reputation on the bodies of those they have trodden down. It seems to me we have come to a degree of intelligence, when all sensible thinking men will see the future of this world of industry we are so vitally interested in,—see that it depends upon a knowledge of the method of co-operation. First, co-operation and service to the community, because the community will regard us just to the degree

we render service. You can't put anything over on the public, if you try to, you can't get anything out of it; but if you render to the people a real service, you will get your reward. If instead of merely talking about it we honestly try to bring this period of competition into one of co-operation we will find this industry more quickly attaining the goal to which it is entitled, a goal to which it has been leaning for the past fifteen years.

There is no question but that the ice cream business stimulates the milk business. It has created a business whereby the over-supply of milk in the summer time is used; and in the winter time, and when not produced so abundantly, it goes to the milk people. So the industry is rendering a service to every man who is producing milk, and if we will come to that point where we are willing to try to bring about co-operation in our industry, the more industry will prosper, and each member must of necessity prosper accordingly.

So folks, I just simply plead with you this one thing,—here in Pennsylvania we make possibly 22 million gallons of ice cream. Let us make this Pennsylvania Association the biggest thing in the United States; let us by the conduct of our business, attract the attention of other states in the Union so that they will believe the state of Pennsylvania the finest state in the Union. (Applause).

Mr. Hartzell: Mr. President, and when I say it I hope it will be as long as this Association lasts,—I want to make a motion that we give a rising vote of thanks to the gentleman who just made this address.

Chairman Crane: What will you do about this motion?

Motion seconded, and unanimously carried.

Chairman Crane introduces Geo. M. Brink (Pottsville) who speaks on "Benefits of Regional Ice Cream Associations."

Mr. Brink: Mr. President and Members of the Association, as Secretary of the Central East Ice Cream Association, I want to toot the horn for our members, so I have prepared a little stuff here entitled, "Benefits Derived from Regional Associations."

The benefits derived from regional associations are numerous and of various kinds. These benefits can best be summed up under the following heads,—adjustments, advertising, arbitration, compilation of trade information, cost accounting, elimination of excess varieties, elimination of abuses in trade practices, labor problems, insurance matters, investigations, (both technical and practical) legal advice, market reports, production problems, research work, standardization, technical information and traffic work, (both express and freight) and last but not least establishing good fellowship among competitive manufacturers.

In all probability the Central East Ice Cream Association can be looked up to as a good example of benefits derived; this association having stood as a body, the acid test for almost two years. We have had several ups and downs, but have always come through with colors flying high. One of the biggest benefits that have been derived has been the fact of meeting a competitor face to face and holding a **friendly** conversation, thus allowing each to study the other, and the result has been a **permanent** friendship. Before this association was organized in this district, the competitor's usual method of talking about another was in an unprintable way. Today, you will find this condition practically eliminated in the district we cover, which includes the following counties: Franklin, Chester, Northumberland, Northampton, Cumberland, Montgomery, Carbon, York, Berks, Lebanon, Lehigh, Lancaster, Luzern, Dauphin,

Speed Up

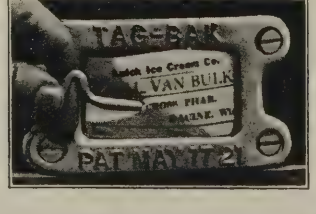
The New Era Company
146 Merritt St. Oshkosh, Wis.

Schuylkill. We have found that to take in a larger area brings about many difficulties. It is a well known fact that commercial conditions differ largely when you travel from one territory to another, and that is the reason that a small association with set rules cannot dictate for a large area.

This association has several examples of the good work that has been accomplished. As a general condition in our region, you will not find what may be termed "over advertising." For instance, if a customer comes to a manufacturer and asks for a large, elaborate electric sign or else lose his business, the manufacturer knows that he can stand fast and not give this sign, because his competitors would not do so. Another example, is the matter of loaning money to a customer to get his trade, and as an example of what has actually happened in our association I will quote something like this: A customer called a certain manufacturer and asked him to loan $500 in cash so that he might further his business. The manufacturer refused to grant this request and was immediately informed that his competitor would do it, and that he, the manufacturer, should have his cabinets removed, thus signifying he was out the trade. The first manufacturer immediately called the other fellow who was said to have made this arrangement, and learned from him that it was not true. Had this man not been an association member, this would not have been done, or maybe the customer would have carried out his $500 proposition. As it stands now, the customer could not use the manufacturer as a bank, nor would the first manufacturer lose the trade by having the customer try to jockey him.

Undoubtedly the small manufacturer has reaped a larger benefit from this association than some of the larger ones. It is a well known fact that the small manufacturer could not stand the overhead of an elaborate cost system, thus doing a business more or less in the dark and allowing the customer to use a club on him, beating him down in his price, even below what his material would cost. The larger manufacturers in the Association have been good enough, and they should be, to give the small fellow cost values, which enable him to get an approximate cost of his own material without any overhead attached to it. By doing these favors for one another, it can readily be seen that the customers in this region are being canvassed and sold to on a quality and service basis, and not a price proposition.

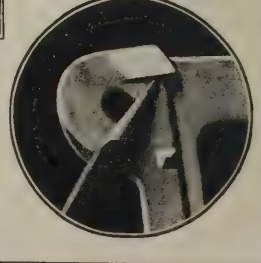
On matters of arbitration as to troubles that arise between competitive manufacturers, we have appointed a man in each district to listen to the arguments and adjust the difficulties to the satisfaction of both parties concerned. It has usually been found that when troubles exist between manufacturers, it is a case of the customer being a better buyer than the manufacturer is a seller. In many instances too numerous to mention, these arbitrators have stopped the customers from bulldozing the manufacturer and having him almost give his product away by threatening that if this fellow would not give him what he wanted. This association has been instrumental in keeping legislation that had to do with our industry, within reasonable bounds.



We did good work at the time the auto license fee was to be raised; also at the time our so-called competitors tried to put over their cocoanut fat proposition. The Pennsylvania State Association should thank the Central East Ice Cream Association for bringing forth such a man as Thomas Hall, of the Russ Bros. Ice Cream Co., who undoubtedly would not have come forth to the front had it not been for this association. With very few exceptions, we have met each month in different cities, at the option of the membership. We have had outsiders make addresses, but with such wonderful talent in our own association, it is very rarely that we have to go outside for men to lecture and talk on subjects in which we are interested.

This association has been termed "a price-fixing association." This is absolutely wrong and untrue. Our main object is to eliminate unfair practices and methods of making business, and to place the ice cream industry as a whole, on the highest plane possible.

The friendship established among our members can never be destroyed. We have grown to know one another by our first names, and each treats the other as a man.



Some subjects to be taken up that lay on our association desks at the present time are: The rental charge per hole for cabinet service to a customer; our idea being to try and abolish the customer's using of too large a cabinet for the size business they do. Another is the matter of establishing a trade credit bureau, and a third a central purchasing and pricing bureau in regard to raw materials and supplies. As regards cabinets, one of our members had just been compelled to buy three carloads of cabinets, which not only broke his heart, but busted his pocketbook. He remarked, "How am I going to get my living?" In our association, the idea was proposed of charging a rental per hole in the cabinets placed in stores,—take the interest on our investment, depreciation, labor, etc., and apply that on the renting of the cabinet, charging each customer a rental on a monthly basis. Our association is going to try and put that over, but you can't put it over unless you have an association like the Central East, that will stick together. I hope by the time we meet again, we will have these

Why TAG-BAKS Bring Your Tubs Back

is best explained by the special patented construction of the TAG-BAK itself and by those who have used them.

The projection on the back is the little device that lets the tag slip in easily and prevents the tag from coming out again. Only a sharp pointed tool; deliberately inserted in the tag can remove it from the TAG-BAK System.

Learn more about the TAG-BAK System thru one of our circulars—write

TAG-BAK, 183 Ogden Ave., Milwaukee, Wis.

things working, so I can tell you how they are working out.

Now, I want to plead with some of you fellows about putting free regional associations in your district. As a general average, I have found that a man puts out 75 pounds of ice and 15 pounds of salt for every 15 gallons of ice cream. You can't find that in the Central district. We don't go to another man's customer and say, "Here, we will give you so much." I defy anybody going into the Central District and find our association doing that. We are sticking together on that, also on our advertising. We don't paint a man's building, refurnish his store, or finance him,—that is not being done. We are giving a customer all he can figure on, and making a legitimate profit. We are not at each other's throats. When this or that happens, we go to the telephone and say, "Did you promise this man this or that?" and he says, "No." And when that man says "No" who is an association member, we know he means no.

We have no price fixing association in our district,—have a price variation of from $1 to $1.40 for the same kind of service. But we are staying clean, and not going out and saying this or the other fellow is a dirty bum, and he is using this thing or that, or other things that are unfair. We are meeting on the level, and doing business in a clean way. I want to say to you we are going over the top, going to save money for each of our members, and give the customer dollar for dollar for what he is paying. I don't see why you can't have such an association in Philadelphia, Pittsburgh or Erie, and I hope next year we will have several instead of one. Applause).

Chairman Crane introduces Mr. L. M. Hendler, of Baltimore, who addresses the Association on the subject, "Boosting Winter Business."

Mr. Hendler: I am not surprised at President Crane calling on me. He is just getting back something I owe him. I arrived a little late, but early enough to hear the gentleman talk about co-operation.

I started in the ice cream business with some of the older fellows, when we used hand grinders, and I have been fairly successful. I have been able to make a good living, provide for my family, drive an automobile. I think I have got about everything the Good Lord owes me, and the world doesn't owe me a thing. I have done that through what I thought was co-operation, but I have reached the point now where I have decided I am not going to try and reform anybody else,—I am going to let them go to h—l, as they please.

We are today in Baltimore giving what we feel is a fair price for good ice cream. I believe that every man here knows that at one time we made the poorest ice cream in the United States, but we did the best we could at the price we were getting, and you have got to give us credit for being able to come from 50c ice cream to $1.20,—that was the hole we had to climb out of. When our Philadelphia friends were getting 80c and 90c we were getting 50c and 60c. Today our friends in Philadelphia are kicking one another over the door steps for $1, and we are still getting $1.20.

Competition was getting so that I had about decided to give up, when we decided to take stock of ourselves. Whether here, or in Baltimore, co-operation is not going to be a success; you will not do certain things; you can talk all you please, but unless deep in your heart you are going to do these things, your association will not be a success. We thought we were co-operating in Baltimore. Some of you men have interests in Baltimore, which possibly should be looked after before they go to

Increases Winter Business

Think what it would mean to you to ask thousands of customers their first choice of fruit, and flavors, and then offer those same customers a combination of a dozen or more of those first choice fruits and flavors, made into a **Supremely Delicious Ice Cream.**

Blanke-Baer Honey Fruit Salad

The Marvelous Fruit Combination means much in overcoming Winter Selling difficulties as Honey Fruit Salads adds to your Ice Cream just the Fruit and Flavor your customers want.

Put up in gallons cans, 10 gal. kegs, ½ bbls. and bbls.

Don't lose time or wait for sample. Order TODAY a case (6 gal. cans) of this heavenly mixture. You'll be surprised at wonderful results and low cost.

the devil. They have the same conditions there as in Philadelphia. I say these things openly, because that has been my method, and so as to benefit the entire association here. We are not in business for our health, but profit; and unless you fellows take stock among yourselves first, all this association and co-operation talk doesn't amount to a damn.

As I said before, I am not much of a talker, but I can argue a question much better than I can talk. So I am willing to take up and discuss this subject, but so far as making a speech is concerned, I can't do it.

Mr. Rieck: What do you think ought to be done?

Mr. Hendler: Take stock of ourselves first.

Mr. List: How are you going to do that?

Mr. Hendler: Down deep in your hearts you know whether you are doing right or wrong. I am not the most honest fellow in the world,—can do a trick as well as anybody else, and anybody who thinks he can pull a trick on me, is kicking me and defying me to go and pull a trick on him,—that is just exactly what he is doing.

Question: Are they underselling you in Baltimore?

Answer: That is a pretty broad question.

Q. Are they cutting prices?

A. We have four prices: 90c to $1.20.

Q. We have five: $1 to $1.50.

A. When you sell that ice cream at one price, and another ice cream at another, it is a question of getting down to quality.

Q. What is the idea of so many different grades?

A. You can't sell any person quality ice cream at a low price. You cut quality until you go out of business.

Q. I understand Philadelphia is hauling ice cream to New York?

A. Because they can't get enough out of it in Philadelphia. I believe all Philadelphia manufacturers deem they are not making a great deal of money out of it, at $1 per gallon. I heard a man say the other day "They want to make the dealer pay for their business out of the dealer's business." If a man wants an electric sign he comes to you and says, "If you don't give it to me the other fellow will." Putting two and two together, the other fellow won't do it. Of course, there are two ways of looking at an electric sign, and it is all right if a man has enough business to justify it. Whether you put it in electric signs, bill posters or newspapers doesn't make any difference, but when I paint a man's place, and he is my customer; then my competitor comes along and gives him $50 for that same place, after I have painted it, that is where you are stepping on my corns. That is what the association is for.

Mr. Rieck: Don't look at me, I don't belong in Philadelphia.

Mr. Hendler: Do you know why I look at you? I like to look at a fellow who has good sense enough not to do those things.

Mr. Rieck: But you might create a wrong impression.

Mr. Hendler: You are a good scout. You know how it is. Here is a cabinet over here. Some salesmen don't know a thing. It is "Whose ice cream are you using? Oh, that fellow Rieck? He just put in a beautiful cabinet for a fellow two blocks away, painted a sign on his wall, fixed his windows." That is the kind of feeling that causes trouble. He may say "The water is all over your floor. Why don't you get them to connect that to the sewer,—we did that for the fellow down the street?" "You ought to see the cabinets we put in. You don't have to have that counter there at all, as this

cabinet comes as a counter and everything else." Those are the things that get you into trouble, and those are conditions you have got to take stock for among yourselves.

I heard the remark here about a charge for the service and cabinets, and about the only time people get together is when somebody has died. When the ice cream people get close to death, then they realize something has got to be done. In Baltimore we got pretty close to death, so we formed a little association and decided to charge a fine of one cent per gallon for every gallon he sold, to the first fellow who jumped the price. We put a service charge on every customer, and I believe it is one of the best things we ever did. We charge every man $2 per week for service. That regulates his price, and if he uses 25 gallons of ice cream a week, his ice cream costs him 8c per gallon for additional service. If he uses 100 gallons, it costs him 1c per gallon. That took care of the big customer at a little lower figure. It took care of the situation as easily as anything we could do, and there wasn't a great deal of bookkeeping.

At one time we made three flavors—vanilla, strawberry and cherry. Today we are making six known flavors, and a couple with names nobody knows. We run strawberry, cherry, vanilla, peach, and two private brands. We run extra names and occasionally drop out a flavor. Something has got to be done to give the fellow a little better service, and I am frank to admit I would do it myself.

Some of the manufacturers give to the trade individual bricks—vanilla, strawberry, cherry. Now, if you give a fellow those individual bricks, price doesn't mean anything at all. When we were near death, at 60c a gallon, we formed our little association, we got together, and we never made so much money in our lives as we made after that.

Mr. Rieck: Does your association still exist?

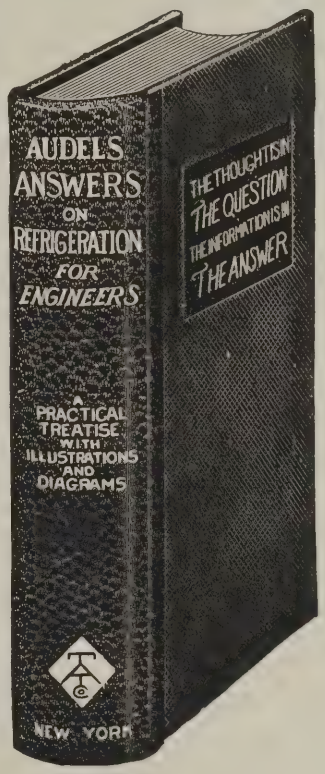
Mr. Hendler: No. Some of our patrons died, some went out of business, etc., and we are now waiting for another death.

Mr. Rieck: Couldn't you get the new fellows to consider it?

Mr. Hendler: I don't think it has gone so far that something couldn't be done, but I wouldn't want Baltimore to be held up as an example to the rest of the world. The salesman is the one who is responsible for it, you know. (Applause).

Chairman Crane closes the session, with announcing and having read a telegram from Wm. D. McCormick, Pittsburgh, Pa., regretting his inability to attend the convention.

Adjournment.



NEW BASIC FRUIT PRODUCTS.

Puyallup, Wash., is in the midst of a most wonderful valley stretching from the foot of Mount Rainier, whose summit is cold-storaged with a perpetual ice crop covering fifty square miles. Rimmed in by three distinct ranges of foot-hills, and influenced by the great Puget Sound, the Puyallup Valley is favored with an equitable temperature the year around.

The research laboratory of the Puyallup & Sumner Fruit Growers Canning Co., Puyallup, Wash., is increasing the efficiency of its laboratory equipment. This department, under the direction of Dr. W. S. Beekman, will investigate the basic by-products of bush fruits.

Over ten million pounds of bush fruits are handled annually through the Puyallup & Sumner Fruit Growers' canneries.

Can You Answer These Simple Questions on Refrigeration?

How may refrigerator machines be classified?

What are the different forms of compressors? What conditions make top expansion desirable and what bottom?

What is the first process in pumping out expansion coils?

Could a single cylinder, double-acting compressor be kept in service while being repaired?

If Not—You Need a Copy of This Book

A practical book that should be handy wherever mechanical refrigeration is employed.

SPECIALTY BRASS COMPANY HAD COMPLETE FITTINGS ON DISPLAY.

The Specialty Brass Company, of Kenosha, Wis., had a most complete and interesting line of sanitary creamery fittings at the National Dairy Show; and several new innovations in fittings were shown at their attractively decorated booth.

One of the new accessories was a strainer used where large quanities of milk are taken care of, principally on homogenizers and such other machines.

A sediment tester was on display which was designed by Mr. Kendall, of Potsdam, N. Y. The sediment in the milk is quickly and accurately located in a few moments' time. A patent has been applied for on this machine by the inventor.

A no-foam can filler, which is considered an improvement on the older type, in that it can be taken apart and cleaned in the proper way, attracted no small attention at the show. This filler facilitates cleaning regardless of condition and misuse, as in some of the older types it is most impossible to take them apart and clean in the proper way.

Drains for ice cream cabinets and a new sanitary check valve were shown.

Mr. Chas. Anderson had charge of the display.

ICE CREAM IS KING.

According to statistics presented by the National Association of Ice Cream Manufacturers since prohibition the consumption of ice cream in this country has increased by 100,000,000 gallons a year. In other words, instead of putting a foot on the rail and ordering three fingers of bottled in bond, the citizen in search of refreshments, strolls into a soda emporium, studies the list of flavors as keenly as he used to ask "What brands do you serve," and once served ladels his order into his interior, instead of pouring it down at a gulp, with a chaser and wry face to follow.

It's a good sign, every way you take it. It pays the farmer better to feed his grain to cows and sell his milk to the ice cream maker than to sell his corn or rye to the distillery, and 100,000,000 gallons of ice cream a year requires a lot of cows to produce the necessary milk. And the ice cream business is a better business all around than the corner saloon.

"But," says the man on the other side of the prohibition fence, "there is not a kick or a punch in a whole gallon of ice cream," and that, brother, is why the ice cream box is more popular with the wife and kiddies than the old-fashioned "package" some folks used to take home.—Harrisburg (Pa.) Mfg. Co., Detroit.

OBSERVATIONS.

By C. J. Yuncker, of Rex Extract Company.

Buckeye Dairy Co., Marion, O., is now making ice cream. Mr. E. A. Williams is the proprietor.

* * *

Salem Sanitary Milk Co., Salem, O., will install an ice cream plant. Mr. Smith is the buyer.

* * *

Mr. Mitchell, formerly with Tiffin Pure Milk Co., Tiffin, O., has taken a position with the Seneca Dairy Co., Fostoria, Ohio.

* * *

The Paige Dairy Co., Toledo, O., is building a new addition to their dairy plant.

* * *

C. O. Wells Creamery Co., Crestline, O., will install a new ice tank and cold storage room.

* * *

Mr. and Mrs. Chas. Beardsly are spending a vacation with relatives in North Carolina. Mr. Beardsly is manager and buyer of the C. O. Wells Creamery Co., of Crestline, Ohio.

* * *

Sanitary Tinning Co., Cleveland, O., will have an exhibit in Booth 32 at Michigan Show in Saginaw, Mich., February, 1922. Mr. A. J. Miller will see to the booth.

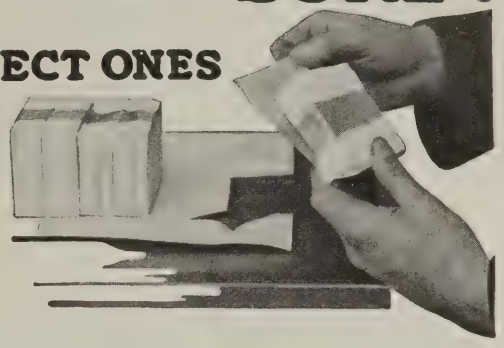
* * *

Bryan Ice Cream Co., Bryan, O., just purchased a two-ton Wilson truck to add to their fleet of automobiles.

* * *

Esmond Dairy Co., of Sandusky, O., will erect a creamery and condensed milk plant at Fulton and Railroad Sts., Port Clinton, O., the building will be three stories. Ice cream for wholesale trade will also be made in the plant. It is also expected that they will later manufacture artificial ice. Mr. R. E. Miller will be the manager.

* * *



The A. E. Hughes Dairy Co., Bowling Green, O., has installed a Rapid Bottle Washer in their milk department. They are making other improvements.

* * *

The prize winners for the Ice Cream Supply Men's Salesman Club was announced in Buffalo, N. Y., during the convention there last week. They are as follows: C. J. Yuncker, Toledo, O., first prize; J. W. Mulligan, Louisville, Ky., second prize; A. A. Senor, Cleveland, O., third prize; S. W. Mendelson, Chicago, Ill., fourth prize. The first and second winners represent Rex Extract Co., Brooklyn, N. Y.; third winner represents National Paint and Varnish Co., Cleveland, O.; the fourth winner represents A. Daigger & Co., Chicago, Ill. The

"National Approved Ladd *Distributors Specialties"*

DETROIT CLEVELAND

Salesmen's Club held a meeting on Friday night when Mr. Yuncker made a speech to them.

* * *

Mr. Chas. A. Beall, President of Rex Extract Co., Brooklyn, N. Y., and his southern representative, Mr. J. W. Mulligan, attended the Atlanta convention as the firm had an exhibit there.

* * *

Look out now and make arrangements to attend the Michigan Allied Dairy Convention in February, 14th to 17th, 1922, for the show will be a good one and have plenty of exhibits there. Let us all be there.

* * *

All ice cream manufacturers, cheese manufacturers, dairies and creameries in Ohio and Indiana, especially

The Shore Acres Creamery Co., Pontiac, Mich., are thinking of building an ice cream plant.

* * *

The Widlar Co., Cleveland, O., will have an exhibit at the Michigan show at Saginaw, Mich., in February, 1922. Howard Black will take care of the booth.

* * *

Rex Extract Co., Brooklyn, N. Y., will have an exhibit at the Michigan show to be held at Saginaw, Mich., in February, 1922. Their representative, C. J. Yuncker, will take care of the booth. He invites you to make their booth your headquarters while attending the show.

* * *

A. J. Miller of Sanitary Tinning Co., Cleveland, O.; Howard W. Black of Widlar Co., Cleveland, O.; A. E.

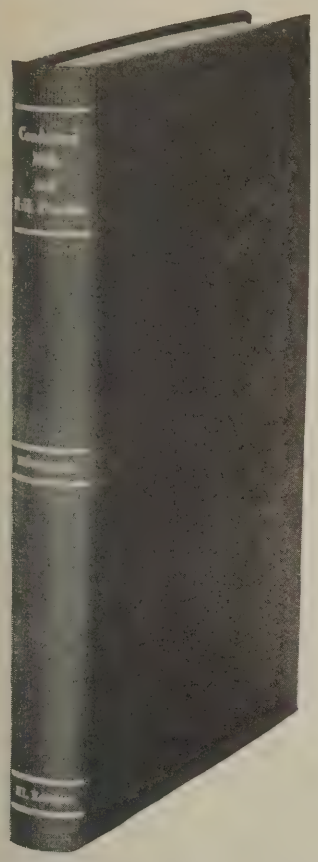
those who are located along the state lines, should attend the Michigan Allied Dairy Convention and show at Saginaw, Mich., on February 14th to 17th, 1922, and get acquainted with the manufacturers in Michigan so as to know each other more and work closer together. You will see a show with nice exhibits, for Michigan has always had good exhibits. You will no doubt find the attendance will be good and surely will enjoy yourselves while there. Think this over and see if you can not attend this show.

* * *

The City Pure Milk & Ice Cream Co., East Liverpool, O., will erect a modern plant for their business.

* * *

C. J. W. Smith, Detroit, Mich., representative for Creamery Package Manufacturing Co., also secretary of Michigan Dairy Boosters, has had his hands full as Mrs. Smith has had a long spell of sickness.



McFarland, Chicago, Ill., who sells Essex gelantine, will be at Michigan convention as usual.

* * *

Some of the salesmen returning on their way home from the Buffalo convention stopped off at Cleveland, O., Sunday night and were entertained at the home of A. J. Miller of the Sanitary Tinning Co., and they all had a good time, as Mr. and Mrs. Miller know how to entertain their friends. Of course Miller would make you split your sides a laughing for he is such a hearty laugher himself.

* * *

Mansfield Pure Milk Co., Mansfield, O., will install new boilers in their plant, also build a new cold storage room and make some other improvements. Mr. Sam Isaly has become the buyer for the firm, taking the place of his father, as buyer. Mr. William Isaly has

Condensed Milk and Milk Powder

(BY OTTO F. HUNZIKER)

THE THIRD EDITION of This Book Has Just Come from the Press.

This work represents a new book from cover to cover. It contains the description of the latest equipment and of the most improved methods and practices in the manufacture of every marketable line of condensed and dried milk products.

The More Outstanding New Features Are:

New methods for cooling sweetened condensed milk to prevent grittiness and sugar sediment.

New methods for sterilizing evaporated milk to prevent formation of a permanent curd.

Viscosity tests.

Condensing and drying of buttermilk by commercially practical methods.

The use of the Ruff Condenser.

Description of 20 different processes of desiccating milk by the dough-drying principle, the film-drying principle, and the spray-drying principle.

Detailed discussion of the commercial manufacture of powdered milk.

Cost of manufacture, composition solubility, properties, defects and keeping quality of milk powders.

All other chapters have been revised so as to make available such information as will be of the greatest service in the successful manufacture and marketing of condensed and dried milk products under the new and changed conditions of the industry.

The price of this new and enlarged volume is $5.75 per copy.

Send your order with remittance to

The Olsen Publishing Company

been on the sick list but is now able to be around the plant.

* * *

The Defiance Ice Cream Co., Defiance, O., purchased the Defiance Dairy Co. plant and added it to their business. W. C. Hopkins and Geo. Watts are the new managers.

* * *

The American Ice Cream Co., Cincinnati, O., will remodel their plant.

* * *

Mr. W. D. Axtell, formerly with the Esmond Dairy Co. and also the Martin Ice Cream Factory at Sandusky, O., is now manager of the Dickson Creamery Co., Mansfield, O.

* * *

Dairy Products Co., Bucyrus, O., has completed the new two story brick addition to their plant and also has added a cheese plant to their business.

* * *

The Paige Dairy Co., of Toledo, O., is building a two story brick building all up to date for a branch dairy and ice cream plant in Mansfield, O. It is being built on Franklin St.

* * *

A. D. Baumhart, Vermilion, O., is planning to build a new building for his ice cream plant. His business has grown so large that he needs more room.

* * *

Mr. Charles Isaly, manager, and Mr. W. H. Yuncker, salesman for the Isaly Dairy Co., Marion, O., made a trip to Maine for deer, and as both are good hunters, they came back home with a deer each.

The Ice Cream Review editor's sidekick is some writer. Come to Saginaw for convention and see the happy bunch who attends it for they are hustlers.

NOT A "FLYER" BUT A "BOOSTER."

C. J. W. Smith, secretary of the Michigan Dairy Boosters, and Detroit representative for the Creamery Package Manufacturing Company, wrote us a letter and informed us that we had titled his picture in the November issue of The Ice Cream Review a "Dixie Flyer" when he was just a "Michigan Dairy Booster" and was proud of it. So we make this correction, folks, to let you know that he is not a Flyer but a Booster, though we'll wager he could do both if he were called upon.

The letter reads as follows: "Hurrah! Also Huroo! I see on page 26 of the November Ice Cream Review I am all pictured and listed as 'A Dixie Flyer.' That's good, and I would be glad to be one of them, especially as I see our friend Adolph Skinner, who really is a 'Dixie Flyer,' is set in on the same page.

"The Dixie Flyers are all good fellows, and while I am proud to be so listed, still, however, notwithstanding and what is more to the point, I am really not entitled to that honor. As a matter of fact, I am a 'Michigan Dairy Booster' and proud of it. And don't forget we are boosting for the biggest and best ever convention at Saginaw, Mich., February 14-17, 1922. Floor space is being taken rapidly. Secretary Wendt tells me he is now worrying because there is a probability there will not be space enough and late comers will be disappointed.

"We are going to have a real exhibit of machinery and supplies by the creamery, ice cream and dairy supply houses.

"The program promises to be exceptionally fine. A banquet and smoker are also on the list. Not a combination, but a real banquet put on by the Allied Dairy Association and a smoker by the Boosters.

Brother Yunker of the Rex Extract Company writes that he has taken space 31—also space 30 for the Widlar Company of Cleveland—and space 32 for the Sanitary Tinning Company of Cleveland. That's the spirit that makes the Michigan Boosters."

BRING THE LADIES.

Secretary Caughey of the Wisconsin Association of Ice Cream Manufacturers has authorized us to state that special arrangements will be made for entertaining the ladies at the January convention. Bring them along.

The annual meeting will be held at Hotel Plankinton, Milwaukee, January 17-18. Secretary Caughey and President Smith are both working on a good instructive program which we expect to be able to publish in next issue.

It has also been reported that Secretary Harwood, of the "Badger Flyers," and his committee are busy working on the entertainment program to be given by that live organization during the convention. We could tell you right here about some of the "flying stunts" that Harwood is spending many a night's sleep over, for instance, how can a Badger fly." But we are not going to let the cat out of the bag. All we can say, there is going to be plenty of fun and entertainment on tap. Come and see for yourself.

If whistlers are allowed to go to Heaven a second rebellion may occur.

Condensed and Evaporated Milk Market Report

By Bureau of Markets and Crop Estimates, U. S. Department of Agriculture.

Manufacturers Wholesale Selling Prices of Condensed and Evaporated Milk (October)

The wholesale prices given below are based on reports made by manufacturers covering actual sales of condensed and evaporated milk to jobbers, wholesale grocers and similar buyers, delivered at manufacturers' distributing points on basis of cash or short time credit. Foreign prices are given as F. O. B., or F. A. S., points of export in section in which sales were made.

RELATIVELY HEAVY PRODUCTION OF CONDENSED AND EVAPORATED MILK FINDS BUT MODERATE DEMAND.

Condensed and evaporated milk markets are still featured more or less unsatisfactory trading conditions, with the November demand apparently offering little support beyond the very moderate movement which has continued to take place. From nowhere are there encouraging reports indicating a domestic or export demand which seem sufficient to absorb this season's production of canned milk. Export buying seems to be limited mostly to relief agencies, but latest available export figures indicate a marked falling off even of this class of business. This outlet is recognized to be of a temporary nature only and cannot be depended upon indefinitely. Other export business is difficult because of unsettled foreign trade conditions, making it more of a problem as to how the anticipated production is to be disposed of. The domestic outlet has been somewhat enlarged through advertising, but even with retailers in some quarters featuring the goods at attractively low prices the lessened purchasing power of the public presents itself as a new factor to contend with. The pressure of this condition has been felt mostly by the less known brands, although numerous manufacturers indicate that their standard brands have been affected. Late figures on production are not available, and it cannot be stated definitely whether production is being materially curtailed, but there is talk around to that effect. It appears that at present prices other manufactured milk products would offer considerable competition. Milk production has kept up remarkably well for the season, favored by the mild fall, and in certain districts the surplus is reported to be quite heavy. The advent of winter weather will materially reduce this, although there are said to be plentiful supplies of cheap feed in some of the principal producing sections.

Lighter Exports for Relief Purposes.

The October figures furnish the latest available export data, and show that but for a lighter movement the heaviest shipments continued to be made to the same countries as during August and September. However, exports to Germany were materially reduced during October, especially evaporated milk. As in September, exports of condensed constituted only about one-third of those of evaporated goods. In 1920 the reverse took place, the shipments of condensed goods being much the heavier. October exports this year of both classes of

January-October, Inc., 1920 ..... 2,271,140 pounds

RELATIVELY HEAVY PRODUCTION OF CONDENSED AND EVAPORATED MILK FINDS BUT MODERATE DEMAND.

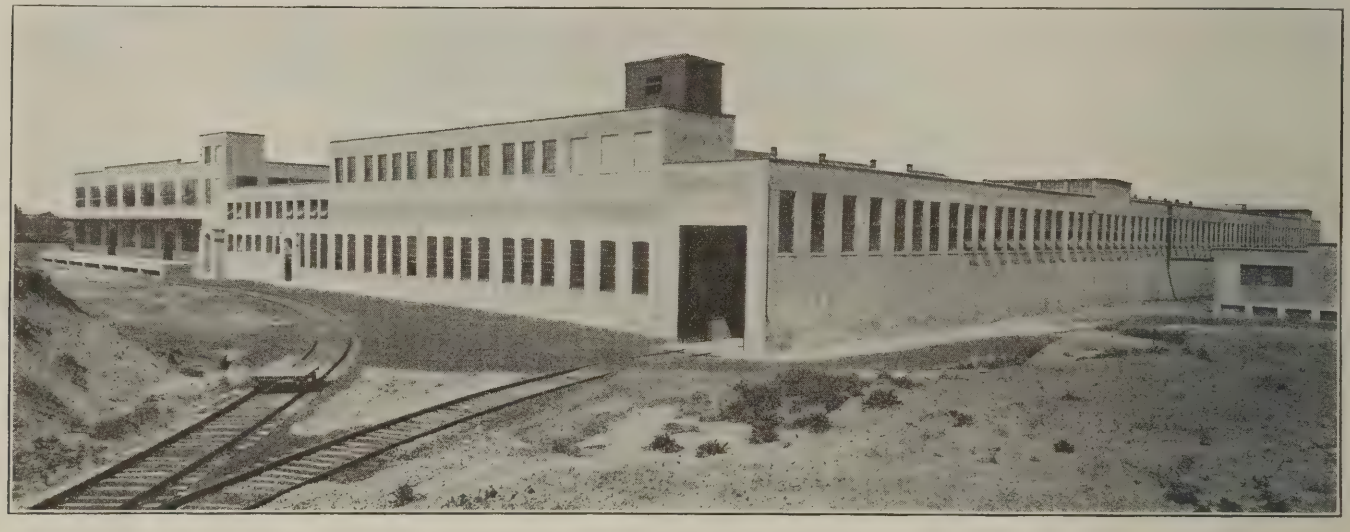
(Continued from page 132)

goods were considerably heavier than those of October, 1920, approximately an increase of 12,000,000 lbs., but the total movement for the first ten months of the year lags behind the similar period for 1920 by some 125,000,000 lbs.

Comparisons of the stocks held by manufacturers show that they were close to 50 per cent lighter on November 1, 1921, than on November 1, 1920. This is also true of unsold stocks. Comparison with the previous month reveals slightly lower total stocks, but heavier unsold stocks. Figures showing this comparison appear in the accompanying tables. The relatively heavier movement of case evaporated during the past few months may have contributed to more interest in the manufacture of this class of goods, for from a comparison made of the total stocks of firms which reported on both November 1 and October 1, it is noted that stocks of evaporated were heavier on November 1 and stocks of condensed were lighter than the previous month. Just the reverse was true in August and September.

A Mammoth Gelatine Factory

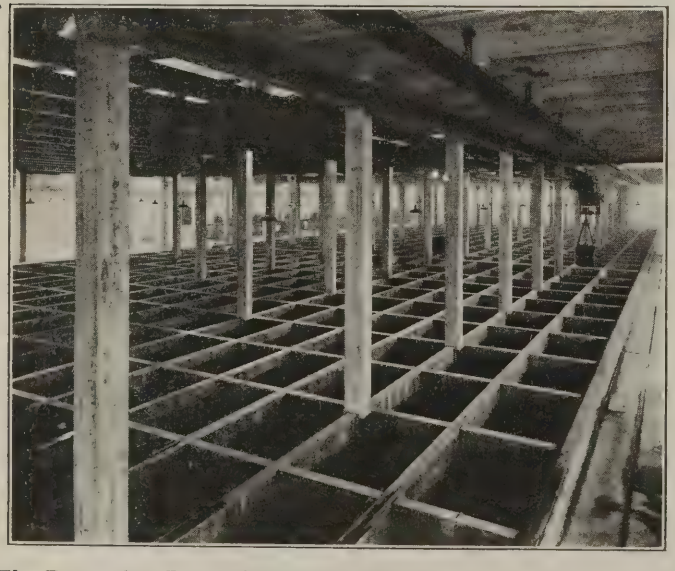
The Ice Cream Review Editor Enjoys a Trip Through the United States Gelatine Plant at Carrollville, Wis.



For a long time we have wanted to see gelatine made. We have a well-developed bump of curiosity anyway, and then we have heard so much about gelatine in years past, pro and con, that we just naturally wanted to get some first-hand information.

Our work used to bring us in close touch with the high dignitaries in food control work, in the different states and in the nation, and we recall the time, not many years ago, when to accuse an ice cream manufacturer of using gelatine in his product was to accuse him of a serious crime. Some of these men still like to refer to gelatine as "an adulterant," "a filler," "a stretcher" or an aid to "air blowing." It is hard for them to recede entirely from the position they took in the early stages of ice cream making.

Gelatine is now looked upon by everybody, not only as necessary to commercial ice cream making, but as a most valuable food element.

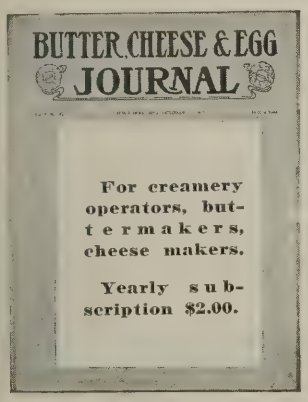


So we wanted to see it made and in these days of high travelling costs it was the most natural thing in the world for us to go for information to a place where we could "fliver" rather than pay railroad fares.

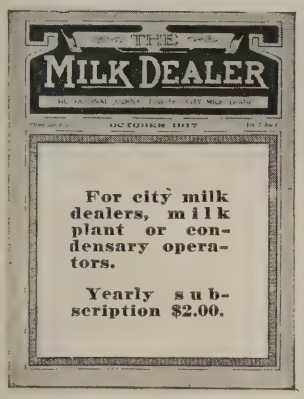
We went to Carrollville, Wisconsin, and we surely "got an eyeful." The pictures accompanying this article will give the reader some idea of the magnitude of the business of the United States Gelatine Company, but they can't tell the whole story. Neither can we, but we want to give you some of our impressions. We were cordially received by Mr. H. W. Luscher, secretary of the company, and Mr. Carleton Bates, superintendent.

The $2,000,000 Plant at Carrollville, Wisconsin.

We asked Mr. Luscher if he couldn't tell us something about the business that would be of interest to the readers of The Ice Cream Review and he replied, "I don't know what there is to say about gelatine. Gelatine is gelatine and that is all there is to it." After our visit through the plant with Mr. Bates we were forced to the conclusion that Mr. Luscher would starve to death in the newspaper business.



The Processing Room, 610 Big Tanks Where the Gelatine Stock Is Held for 14 Weeks.



The "Cook House" Where the "Boilings" Are Made and the Gelatine Run Off.

The main plant is 357 feet wide and 500 feet long, made of solid concrete and is absolutely fireproof. White tile and white enamel walls and ceilings and terrazo floors are found in most of the departments and

THE OLSEN PUBLISHING COMPANY

210 SYCAMORE STREET MILWAUKEE, WIS.

every means known to modern architecture have been employed to make the plant and equipment absolutely sanitary and practical. We got our first shock upon entering the big room where 610 holding vats, each 5½x7x 11 feet, lie "side by each" and containing from two to five million pounds of gelatine "stock" in the process of cleansing and purifying. The "stock" is held in these vats for 14 weeks, being occasionally moved from one vat to another to permit constant cleaning. The different vats are reached by huge grab buckets which travel on mono I beam rails, of which there are 10,680 feet installed.

Along both sides of this large room are twenty-four washing mills, each twenty feet in diameter and five and one-half feet deep. A mammoth filter purifies the water for this big plant and they use 9,000,000 gallons of water

A Section of the Condensing and Evaporating Room Where 12 Big Elyria Glass Lined Tanks Are Installed.

A Section of the Storage Room Furnishing Facilities for Holding 5,000 Barrels of Gelatine Ready for Shipment.

daily. An industrial railway system furnishes all the transfer facilities not furnished by the overhead system.

After the 14 weeks' period of processing and cleansing the "stock" goes to the "cookhouse" on the second floor where there are 50 cook kettles, seven and one-half deep by seven and one-half inches diameter. Twenty-five kettles are in use while the other 25 are being cleaned. The boiling of the stock in these big kettles extracts the gelatine which is drawn off. Successive boilings—four in all—follow at higher temperatures and eac hsuccessive "run" shows, of course, less jelly strength. Dump cars travel from kettle to kettle so that the highest labor efficiency is obtained.

Twelve big Elyria glass lined tanks, six and one-half feet in diameter and twelve feet long are installed in the evaporating and condensing room, as well as four mammoth Swenson evaporators made of special cast aluminum. Glass lined Elyria piping is used throughout for handling the liquid gelatine.

Cooling of the condensed product congeals and forms the gelatine which is carried in thin sheets from the refrigerating machines by long belts on to wire nets, and thence to the drying rooms. Eight big drying tunnels, 15 feet wide, and 6½ feet high and 100 feet long furnish drying facilities. Two especially constructed Davis-Watkins pre-coolers add to the efficiency of the operation. From the big drying rooms, which are heated by warm, purified air, the sheets of gelatine go to the grinding rooms where the gelatine is prepared for market. There are five of these rooms, each turning out a special "blend" or "mix" and are separated to avoid the possibility of error. Each blend is made up of several "runs" and individual boilings are rarely put upon the market. The different "runs" or "boilings" are blended so as to get uniformity in grade, viscosity, jelly strength, clarification, color and physical appearance, in fact, standardization in everything.

A fully equipped laboratory is one of the features of this modern plant and is one of the most essential features as well, inasmuch as the manufacture of high-grade gelatine is a constant fight against bacteria growth. The product furnishes an ideal medium for bacteria propagation, hence the necessity of the best possible equipment to insure sanitation.

The company has branch offices in New York, Chicago, Cincinnati, and Grand Rapids, Mich. The following representatives call on the trade in the sections mentioned:

Hans P. Johnson, Wisconsin, Minnesota, Iowa.

M. C. Patton, Wisconsin.

Wm. C. Valentine, Chicago (Branch Manager).

Ralph Garvey, Illinois and Missouri.

Fred Volkman, Illinois.

T. W. Steward, Michigan and Canada. (Branch Manager at Grand Rapids).

R. P. Driscol, Michigan and Indiana.

C. H. Nieman, Ohio and Kentucky. (Branch Manager at Cincinnati).

Herman Schwandt, Southern States.

W. J. Grothaus, Southern States.

W. E. Hughes, New (Branch Manager at New York City.)

J. K. Upham, New York and Pennsylvania.

Harold Cooper, New England States.

F. W. Baker, Jr., New England States.

The trip through the modern plant was a revelation to us and we only wish that every reader of The Ice Cream Review might enjoy seeing this necessary food article manufactured. It would do the layman good too. He would better understand the merits of gelatine as a food product and would be impressed by the extreme care taken in its manufacture.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—What do you think of the following ice cream formula?

12 lb. sugar, 1 lb. gelatine and flavor (12 oz. gel. and 4 oz. flavor).

87 lb. of 14 per cent cream (made with cream, about 30 per cent, and skimmilk). In an upright 40 qt. freezer what speed should be used to get a good overrun? It takes about 52 lbs. to make a 10 gal batch. G. R. J.

Reply: I am glad to give you below in Table No. No. 1 the analysis of your ice cream mix.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lb. sugar			11.40
1.0 lbs. filler and vanilla			.75
87.0 lbs. 14 % cream	12.18	6.68	18.86
100.0 lbs. mix	12.18	6.68	30.01

You will notice that you have a total solids content of 30 per cent and about 18.5 per cent milk solids. You stated that you are getting ten gallons of ice cream from about fifty-two lbs. of mix. This is all you should expect from your mix containing only 30 per cent total solids. You could very easily improve your formula by adding 2 per cent milk serum solids either in the form of condensed milk or skimmilk powder and that would assure you a little higher overrun, and I believe also a little better ice cream.

* * *

Dear Sir:—Will you kindly make an analysis of the enclosed note, as to fat, solids, etc. How are the proportions? We do mostly a family and some Hotel trade—and make a high grade ice cream, that is we try to.

10 cans 20 per cent cream, 5 cans 40 per cent cream, 4 cans 8 per cent condensed, 3 cans skim condensed, 11 cans 4 per cent milk, 495 lbs. sugar, 12 lbs. gelatine.

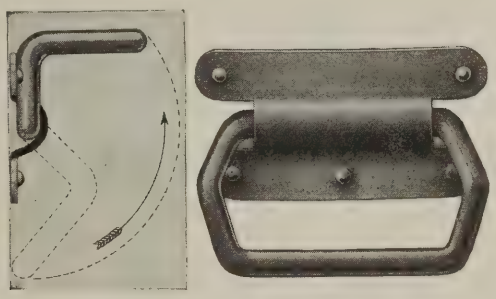
This batch is pasteurized and homogenized.

F. S.

Reply: You will find an analysis of your ice cream formula given below in Table No. 1.

Table No. 1.

Ingredients	Fat	Ser.Sol.	Total Sol.
10 cans—840 lbs. 20 % cream...	168.00	59.81	227.81
5 cans—400 lbs. 40% cream...	160.00	21.36	181.36
4 cans—360 lbs. 8% condensed	25.8	64.80	90.60
3 cans—270 lbs. skim condensed		45.90	45.90
11 cans—946 lbs. 4% milk.....	37.84	80.82	118.66
495 lbs. sugar	.....	.....	470.25
12 lbs. gelatine	.....	.....	11.40
3323 lbs. mix	391.64	272.69	1145.98
Per cent	11.78	8.206	34.5
Per cent sugar	14.8		



You will easily see that you have a formula which should give you excellent results for your family and hotel trade. If, however, you are doing any fountain business I believe your ice cream would be too sweet, containing, as you notice, 14.8% sugar. Your ice cream formula is also pretty well balanced for butter fat and other milk solids. You have perhaps noticed a number of times that I have recommended at least 20% milk solids. Your formula figures out 19.98%.

* * *

Dear Sir:—I would like to ask you to analyze the following ice cream mixes for me if you please.

304 lbs. 20% cream, 72 lbs. unsweetened skim condensed, 56 lbs. sugar, ½ lb. I. C. powder, 10 lbs. gelatine

C. E. ROGERS
Builders of Better Condensing Equipment
8731 Witt St. Detroit, Mich.

and water, 4 lbs. skimmilk powder, 1½ oz. flavor vanilla, 3 oz. color.

How much finished ice cream should each formula make? E. F. H.

Reply: I have analyzed your two ice cream formulas for you and you will find the figures given below in formulas No. 1 and No. 2.

Formula No. 1.

Ingredients	Fat	Serum Solids	Total Solids
204.0 lbs. cream 20%....	52.80	18.78	71.58
64.0 lbs. evaporated 8%.	5.12	11.52	16.64
40.0 lbs. milk 3.5%....	1.40	3.32	4.72
56.0 lbs. sugar	.....	.....	53.20
10.0 lbs. skimmilk powder.....	.....	.....	3.80
4.0 lbs. skimmilk powder.....		3.80	3.80
.5 lbs. ice cream powder....		.....	.45
.2 lbs. vanilla & color		.....	.05
438.7 lbs. mix	59.32	37.42	154.24
Per cent	13.28	8.5	35.1

Formula No. 2.

Ingredients	Fat	Serum Solids	Total Solids
304.0 lbs. 20% cream ...	60.80	21.72	82.52
72.0 lbs. skim cond. 27%		19.44	19.44
56.0 lbs. sugar.....	.....	.....	53.20
10.0 lbs. gelatin & water	.....	.....	3.80
4.0 lbs. skimmilk powder.....		3.80	3.80
.5 lbs. ice cream powder.....		.....	.45
.2 lbs. vanilla & color		.....	.05
446.7 lbs. mix	60.80	44.96	163.26
Per cent	13.6	10.0	35.5

With either of these formulas you should be able to secure a gallon of ice cream for each 4.7 lbs. of mix. You can easily calculate how much ice cream you should get from either of the two mixes. I suggest that in order to make the calculation of your mixes more simple you try to figure out both of these formulas, or either one which you intend to use, on a 500 lb. basis. That is, making the total number of pounds of ingredients weigh 500 lbs. instead of a fraction like 438.7 lbs. By doing this you will easily know what the per cent of fat and solids are in each mix.

* * *

Dear Sir:—I am well pleased with the people I am working for now. My employer is very much pleased over my work although I do not have charge of the plant. He told me as soon as I could get hold of the plant and understand the work and machinery he would like me to go ahead.

Have found out considerable about formulas but don't quite get on to mixes over 1,000 lbs., also do not understand how you figure on condensed milk in the Review you give 35 lbs. of condensed milk, 40 per cent sugar, 8 per cent fat. You figure 2.80 fat, that I understand; but your serum solids 6.10, total solids 22.90. I don't. Is this condensed milk sweetened? Also do you figure the 35 lbs. condensed double the amount of raw milk?

Mr. —— gave me the formulas that he had and I have worked them out satisfactorily.

I am. I. S. O.

Reply: I have your recent letter and I am glad to know that you are satisfied with the position at ——. I should be glad to have you come to Stillwater for a week or longer as I am sure you could spend the time very profitably and learn a good deal about the calculation of ice cream mixes, and about other matters which would probably help you when the season opens next spring.

Referring to the calculation in your letter relative to the solids in 35 lbs. condensed milk, the calculation was made as follows: 35 multiplied by 8 per cent amounts to 2.8 lbs. of fat; 35 multiplied by 40 per cent amounts to 14 lbs. sugar solids; 35 multiplied by 18 per cent amounts to 6.3 lbs. serum solids; which makes a total of 2.80 plus 14 plus 6.30 or 23.10. This calculation is made on the basis that the condensed milk contains 8 per cent butterfat, 40 per cent sugar, and 18 per cent serum solids.

If you should decide to come to Stillwater for a week the only expense you would have would be for your board and room as there would be no fee attached to such a course. Board and room would possibly cost you $2.00 per day.

* * *

Dear Sir:—Will you kindly tell me through your column what effect ordinary soda has on yield, when added to the mix at the freezer?

How long should it take to freeze a run in a Perfection freezer, brine at 19° and obtain the best overrun? With brine at 10° we find the cream freezes too soon to incorporate air. Should it be whipped before turning the brine on, or allowed to freeze with brine valve half open?

Is air whipped out of cream by prolonged agitation in the freezer after it has reached the proper point for drawing? G. C. I.

Reply: Replying to your inquiry regarding the effect which ordinary baking soda has on the yield when added to the mix at the freezer I am glad to say that this soda should have absolutely no effect on the yield and there is every reason that the addition of this soda should be prohibited.

If your mix is handled correctly, aged properly, after mixing and pasteurizing you should have no difficultiy in securing the proper yield. If you have trouble in this respect I should be glad to have you tell me exactly how you prepare your mix and handle it before freezing.

Ordinarily it should not take over ten to twelve minutes to freeze a batch in the freezer. If your ice cream mix is in the right physical condition it should not be necessary to whip it in the freezer before turning on the brine. The ice cream should not be over frozen in the freezer. If agitated too long and frozen too hard the yield will be less than when the ice cream is drawn at the proper stage.

* * *

Dear Sir:—We are wanting to make our ice cream better by using more butterfat, and we have been experimenting along this line, but for some reason we cannot make any headway. We were sure we could get advise from you so we are writing to you in regard to this matter.

Say for instance a ten gallon batch, our ingredients as follows: 3½ gal. cows milk (part Jersey), 7½ lbs. sugar, 1 cup gelatine, 1 oz. meloine, 1 tablespoon Olio-Venild, 1½ gal. evaporated or condensed milk. The brand of this milk is Plow Boy and is said to contain 25.54 per cent solids and 7.8 per cent butterfat.

Drug stores say our cream is not of the standard.

Please send us formula and also please give this formula so as to have the correct per cent of butterfat and correct per cent of solids that the standard cream ought to have, and the state laws require.

How many pounds in a 10 gallon mix? How many gallons in 100 pound mix?

If there are any charges on these formulas let us know and we will forward same.

V. I. C. Co.

Reply: Replying to your recent letter with request for analysis of your ice cream formula, I have figured over your ice cream mix and you will find the calculations given below in Table No. 1.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
3½ gal. or 30 lbs. 4% milk.	1.2	2.5	3.7
1½ gal. or 13.2 lbs. evap 78%	1.3	2.4	3.43
7.5 lbs. sugar	...	...	7.07
1.0 lbs. gel., mel. and flavor	...	...	.50
51.7 lbs.	2.23	4.9	14.70
Per cent	4.3	9.4	28.4

You will notice that your ice cream tests only 4.3 per cent butterfat and with total solids of 28.4 per cent. You understand of course, that your ice cream is not up to your state standard. I suggest that you try the mix given below in Table No. 2.

Table No. 2.

14.0 lbs. sugar	....	....	13.30
3 gal. 26.4 evap. milk.....	2.05	4.75	6.80
14.0 lbs. 30% cream	4.2	.86	5.06
44.6 lbs. 4% milk	1.8	3.81	5.61
100.0 lbs. mix	8.05	9.52	31.37

This, you will notice, tests 8 per cent butterfat and about 31 per cent total solids. I am sure that you will have no difficulty in making a satisfactory ice cream with the mix in Table No. 2. It is best to work with a mix of this kind on a basis of exactly 100 lbs. because in that case the number of pounds of butterfat, serum solids and total solids also represents the percentage of these ingredients. One gallon of this mix will weigh 8.8 pounds.

Trusting that this information will assist you in making a better quality of ice cream.

* * *

Dear Sir:—I want you to give me a formula for a 100 lb. mix of 8 per cent butterfat ice cream. I want to use Carnation brand milk 8 per cent and 4 per cent cows milk. I have something like 500 lbs. of Purity powder on hand and if they will help would like to use them too. Let me hear from you at once. Can I make good ice cream by just using Carnation milk 8 per cent. cows milk 4 per cent, gelatine, Purity powder, flavor and sugar? I. E. P.

Reply: I have your letter of recent date with a request for the formula of a 100 lb. mix containing 8 per cent butterfat ice cream which you wanted calculated by using condensed milk 8 per cent and sweet milk 4 per cent. This will absolutely be impossible and you will have to use either some cream or some sweet butter to bring up the butterfat.

Kindly advise me which of these two ingredients you desire to use and I will suggest a formula for you.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Mobile, Ala.—The Columbia Ice Cream Co. have made extensive improvements lately and the purchase of a five or ten ton refrigerating machine is soon to be considered by Mr. Betha, the manager.

Montgomery, Ala.—The Mellilotus Creamery Co. has organized with W. L. Lancaster, president; B. F. Miller, vice-president and manager; J. T. Fowler, Jr., secretary and treasurer and will go into the manufacture of ice cream.

Little Rock, Ark.—The Clem Cream Co. has incorporated at $50,000. It will engage in the manufacture of ice cream.

Searcy, Ark.—Searcy is to have an ice cream factory. The owner and manager of the Kensett ice cream factory will move same to Searcy and it will be operated in connection with the ice company. Ben Grisham is the owner and a resident of Kensett.

Fort Smith, Ark.—Enlargement of the Ward Ice Cream plant is forecasted as J. Ward has purchased an additional lot.

Brentwood, Calif.—The Oakland Ice Cream Co. of Oakland has purchased the ice cream manufacturing plant of George Davis.

Chico, Calif.—The Ellamore Ice Cream Company of Marysville plans to be represented in Chico with a $15,000 factory. The company also plans to erect factories at Redding and Sacramento.

Los Angeles, Calif.—A $700,000 ice cream plant will be erected. This new company will be headed by W. E. Keller of the Globe Milling Co., and by A. A. Comey.

Redding, Calif.—The Ellamore Candy Co. of Marysville is reported to have decided to put in an ice cream factory and creamery in Redding, the total cost of the building and equipment to be $57,000.

Stockton, Calif.—The Gloria Ice Cream Company are adding 12,000 square feet to their plant and the cost will be in excess of $25,000.

Greenville, S. Car.—The Carolina Ice Cream Co. of Greenville, S. C., has incorporated with capital stock of $75,000. C. M. McGhee is president; J. G. Sherrer is vice president, and L. E. Girardeau is secretary and treasurer. The company has purchased the plants of the Garrison Ice Cream Co. at Greenville and of McKay Ice Cream Co., at Anderson, and will operate both plants. The main office will be at Greenville.

Wilmington, Del.—The Quaker Ice Cream Co. has incorporated at $250,000.

Tallahassee, Fla.—The Leon County Milk Co., purchased the plant o fthe Purity Milk Company of Jacksonville in Tallahassee and will install machinery for the manufacture of ice cream.

Macon, Ga.—A corporation is the result of the merging of the Kinnett Coal & Ice Co., The Odom Ice Cream Co., and the Purity Ice Cream Co. The capital stock of the new Kinnett-Odom Company is valued at $400,000.

Waycross, Ga.—B. J. Ford, owner of the Glynn Ice Cream Co. of Brunswick, Ga., announces that he will open a new ice cream factory in Waycross.

Belleview, Ia.—Not long ago the Bellevue Co-operative creamery had an over supply of ice cream on hand and they gave the youngsters a treat. Fifty-five gallons were consumed in less time than it takes to tell it and the children will long remember their treat.

Muscatine, Ia.—The Leu & Stein Ice Cream Company has started clearing a site for a new factory which will cost $20,000.

Sioux Rapids, Ia.—F. R. Ballantyne has sold his ice cream business to Howard Sawyer. Mr. Ballantyne intends to resume the business in some larger city.

Pocatello, Idaho.—The American Ice Cream Co. is planning the erection of a new $10,000 ice cream factory, to be ready for the spring trade. The site has already been selected.

Twin Falls, Idaho.—The Sterling Dairy Products Company intends to purchase complete equipment for the addition of a wholesale and retail pasteurized milk department to its ice cream and butter factory.

Chicago, Ill.—Kosmos Ice Company is adding a plant to its buildings for the manufacture of ice cream. They expect to have it in operation in the very near future.

Chicago, Ill.—The Kosmos Ice Cream Co. has increased its capital stock from $50,000 to $75,000.

Rock Island, Ill.—O. G. Sturtevant, president of the Sturtevant, Wright and Wagner Dairy Company and Chas. E. Baker a former employe of the S. W. W. Co. of Beloit, Wis., have increased the capital stock of the Sturtevant-Baker Ice Cream factory at Rock Island, Ill., from $70,000 to $250,000, and will begin construction soon of a $200,000 factory in the Illinois city. The Rock Island factory uses eight motor trucks to handle deliveries and is one of the largest industries of its kind in the district. C. E. Baker is the active manager.

Springfield, Ill.—Marshall & Lawrence Co. has changed hands and is now called the Capital City Ice Cream Co. Mr. Schuze is manager of the new concern.

Providence, R. I.—The Puritan Ice Cream Co. will move into their new plant in the spring of 1922.

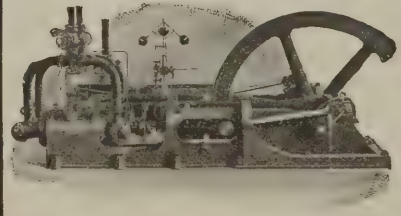
Elkhart, Ind.—The Phend Dairy Company will purchase some new milk wagons. The company uses horse-drawn equipment.

Fort Wayne, Ind.—The Fort Wayne Dairy Co. has recently elected Mr. King as their new manager.

Laurens, Ia.—A new co-operative creamery company is being organized at Laurens. It has purchased the ice cream factory and creamery of J. G. Hinn and is now open for business. Tom Edge is president.

Lawrenceburg, Ind.—The Batesville Ice Cream Co., has incorporated with a paid capital stock of $30,000. The officers are: president, Louis Goyert; vice-president, Daniel W. Foley; secretary, Louis Goyert; treasurer and general manager, Wm. B. Goyert.

Monticello, Ind.—Mack & Company have sold their Monticello ice cream factory to C. R. Byers.



South Bend, Ind.—The Reliable Dairy Co. has incorporated with a capital stock of $100,000. The incorporators are G. C. Palmer, W. H. Palmer and I. D. Shirk. The company will manufacture ice cream.

Garden City, Kas.—C. E. Nuttle has purchased the rink building and will convert it into an ice cream factory.

Goodland, Kas.—D. W. Dillingham, secretary and treasurer of the Dillingham Ice Cream Mfg. Co., of Otis, Colo., expects to locate in Goodland and transfer his company there.

Kansas City, Kas.—The DeCoursey Creamery Company is building an addition to their plant sized 50 x 40. The structure is of two story brick and will cost $20,000. The addition will give more room for the ice cream department and thereby enable them to handle a larger volume in the

645 North Michigan Avenue, Chicago, Ill.

1922 season. A new 100 quart freezer, together with the battery of other freezers, will turn out a volume of 5,000 gallons per day.

Kansas City, Kan.—The Atwood Ice Cream Company has begun the erection of a one-story and basement building, to be occupied next summer.

Manhattan, Kans.—A new ice cream factory will open here Dec. 3rd. The contract for the erection of the new building has been let to a Marysville, Kans., firm.

Pratt, Kans.—The Kaufman creamery is installing a York compressor, size 7½x7½ hardening rooms, to hold 3,000 gallons of ice cream, butter storage for 40,000 lbs. of butter, and a No. 8 Perfection churn is also being installed.

Ashland, Ky.—The Imperial Ice Cream Company, of Clarksburg, W. Va., will build a new plant this winter at Ashland, Ky., as well as in Huntington, W. Va.

Newport, Ky.—It is planned to manufacture ice cream next spring at the Feldman Milk and Cream Company.

Lowell, Mass.—The Cameron Ice Cream Company's new plant is now ready for occupancy.

North Adams, Mass.—The Country Maid Ice Cream Co., of which C. H. Mauser is proprietor, is now building a new plant and will equip it fully.

Webster, Mass.—The Nectar Products Company will have a new ice cream plant.

Worcester, Mass.—An ice cream plant will be built by the C. Brigham Company.

Pontiac, Mich.—An ice cream plant will be added to the Shore Acres Creamery Company, according to F. W. Lambert, manager.

Port Huron, Mich.—The Carlisle Ice Cream Company is erecting a new two story concrete building which will be used for the manufacture of ice cream.

Minneapolis, Minn.—The Northwestern Ice Cream Company will begin work on an ice cream factory next March. G. A. Ball, president of the Ball Pharmacy, is interested. The building will cost about $100,000.

Minneapolis, Minn.—A five story brick and concrete cold storage plant will be built by the Kemp Ice Cream Co.

Northfield, Minn.—The manufacture of ice cream at Northfield will begin in the near future by the Twin Cities Milk Producers' Association. They will cater to the trade in and around Northfield.

St. Paul, Minn.—The Creamery Package Mfg. Co., of Chicago, Ill., will build a new factory and warehouse in St. Paul. The cost will be about $120,000.

Rochester, Minn.—The Cairo Food Products and Dairy Manufacturing Co., of Cairo, Ill., will manufacture ice cream in the Schuster Brewing Company building at Rochester.

Jefferson City, Mo.—The Weber Ice Cream Co. is planning to build another plant in the state of Missouri in addition to their plants in Jefferson City, Moberly and Sedalia.

Kansas City, Mo.—The Okey Ice Cream Company has chartered with $10,000.

Louisana, Mo.—The Weber Ice Cream Co. recently added equipment and will distribute milk hereafter; bottle crates and bottles are soon to be purchased.

Neosho, Mo.—The Quality Ice Cream Company, of Tulsa, Okla., have leased and remodeled the creamery building at Neosho.

St. Joseph, Mo.—The Thomson Ice Cream Company has been compelled, owing to a big increase in business, to occupy larger quarters. Their new plant is on 15th street.

St. Joseph, Mo.—The Thomsen Ice Cream Company is now in their new home.

David City, Nebr.—J. G. Duncan and Arnold Reid will soon have their ice cream factory ready. It was purchased from Tom Case and several changes made.

Minot, N. D.—Campbell & Tompkins have been succeeded by the Purity Ice Cream and Dairy Company.

Trenton, N. J.—An incorporation for $100,000 has been formed by the Hildebrecht Ice Cream Co. C. F. Hildebrecht, A. B. Hildebrecht and Wm. H. Titus, of Trenton, are interested parties.

Albany, N. Y.—The Albany Ice Cream Co. is planning to erect a two-story brick addition to their present plant, which will involve an expenditure of $20,000.

Amsterdam, N. Y.—The Kirk-Naher Company has purchased the ice cream plant and business of Messrs. Hill, Marks & Heath. The business will be continued under the name of The Amsterdam Ice Cream Co., Inc. The company is capitalized at $75,000. Mr. H. L. Hadlock will manage the organization.

Buffalo, N. Y.—The capital stock of the Rich Ice Cream Co. of Buffalo has been increased from one to two hundred thousand dollars.

Elmira, N. Y.—The Nestles Ice Cream Co. is planning to build a plant in Elmira, N. Y. This company is now operating a large plant in Ithaca, N. Y.

Freeport, N. Y.—Fire destroyed the ice cream factory of H. Wiebold. The loss includes the damage to machinery and has not been determined but will run into thousands, it is estimated. Origin of the fire is unknown.

Schenectady, N. Y.—The Presto Ice Cream Equipment Corporation has incorporated with a capital stock of $10,000. W. L. and F. X. Daly, F. Hovey and A. E. Bishop are interested.

Bryan, O.—The Bryan Ice Cream Company intend adding two freezers to their present equipment.

Cincinnati, O.—The DeHaven Ice Cream Company will have a two-story structure, 60x100 feet, with equipment, costing about $75,000 in all.

Cincinnati, O.—The DeHaven Ice Cream Co. will build a new ice cream plant and will be in operation about January 1st. Mr. Connolly and Mr. DeHaven are members of the concern.

Columbus, O.—The Furns Ice Cream Company has purchased the ground south of its present factory for the purpose of building an up-to-date garage and storage building. No better indication can be given of the steady growth of this firm than the present expansion which makes it one of the finest and largest ice cream plants in the state.

Cresline, O.—C. O. Wells Creamery Company will add a freezer, ice tank and cold storage room to their creamery for the manufacture of ice cream.

Dayton, O.—Plants at Piqua and Xenia, O., have been opened by the Red Wing Ice Cream Corporation.

Defiance, Ohio—The Defiance Ice Cream Co. has incorporated for $25,000. The officers are: W. C. Hopkins, president; L. W. Hopkins, vice president; G. E. Watts, secretary and treasurer. They plan to make improvements on plant and to build a new plant later.

East Liverpool, O.—Ambrose E. Webber, manager of the City Pure Milk and Ice Cream Co., announces that the company is preparing to erect a modern ice cream plant.

Findlay, O.—The Findlay Dairy Company will soon add some glass lined tanks and two new freezers to their plant.

Port Clinton, O.—The Esmond Dairy Co., of Sandusky, O., will manufacture ice cream in a branch plant which will be opened in Port Clinton. An artificial ice plant will be established also.

London, O.—The London Creamery plans within the next year to enter the ice cream manufacturing business.

Miami, Okla.—Harry Plummer purchased the Miami Ice Cream factory. He was the superintendent of the Miami Ice Company.

Mansfield, O.—The Paige Dairy Company, of Toledo, is erecting a two-story building, of brick, on Franklin St., in Mansfield.

Mansfield, O.—The Mansfield Pure Milk Co. is intending to add two 60 H. P. boilers and will also have a new cold storage room. Sam Isaly is the competent buyer for the plant.

Marion, O.—The Buckeye Dairy Company, of which E. A. Williams is proprietor, are now manufacturing ice cream.

Norwalk, O.—Gelatines and extracts just now are what the Norwalk Dairy Company is mostly concerned about.

Norwood, O.—Mr. F. A. Huck, the buyer for the Norwood Ice Cream Co., will soon purchase a brick cutter and an ice cream sandwich machine.

Salem, O.—The Salem Sanitary Milk Co. is adding an ice cream department to their plant and will purchase a freezer, cans, tubs and other necessary equipment for the full equipment of same.

Springfield, O.—The Purity Ice Cream Co. is building an addition to the plant and will purchase new cabinets.

Springfield, O.—The Springfield Dairy Products Company will soon purchase a full line of supplies.

Vermillion, O.—Improvements and a new building for the ice cream plant of A. D. Baumhert are now being made.

Purcell, Okla.—A 40 quart brine freezer is the next addition which the Binner Ice Cream Company will make to their equipment in the ice cream plant of that company.

Charleroi, Pa.—One of the most complete and up-to-date ice cream manufacturing plants will be erected in Charleroi by Calistic & Sons.

DuBois, Pa.—Smith Brothers will erect a new ice cream plant.

Kittanning, Pa.—F. F. Bowling, G. R. Schnars and others are interested in a corporation to be called the Kittanning Pure Milk Company. They will manufacture ice cream.

Lancaster, Pa.—The Lancaster Sanitary Milk Company will build a three story building to be used as an ice cream factory.

Milton, Pa.—The Pleasant Valley Creamery Co. will soon install piping for their hardening room. Electric signs, street signs, tubs and cabinets will also be added to the ice cream department.

Osceola Mills, Pa.—An incorporation has been formed by W. R. Swett, A. Britton, F. D. Askey, T. C. Estep and G. M. Estep called Superior Ice Cream Corporation. They will manufacture ice cream.

Scranton, Pa.—The M. G. Ice Cream Co. broke ground for the erection of one of the largest ice cream plants in eastern Pennsylvania. John Mealey, president of the company, presided at the ceremony, which attracted much attention in Scranton.

Tarentum, Pa.—Ganoe and Lee, of the Ganoe and Lee Ice Cream Company, have severed partnership, Mr. Ganoe retaining control of the business.

El Paso, Tex.—About January 1st the Sanitary Ice Cream Company of Cisco, Texas, will be moved to El Paso, and a new name will be decided upon. A new building is being erected and a twenty-five ton ice plant will be in connection.

Huntsville, Tex.—Huntsville is to have an ice cream factory in the near future. Messrs. J. H. and J. V. Ash of Conroe, Texas are interested in the project.

Corpus Christi, Tex.—Plans have been consummated for a large two-story concrete building to be occupied by an ice cream factory.

Sweetwater, Tex.—The Abilene Ice Cream Co., of Abilene, Texas, will have a new ice cream plant in Sweetwater.

Roanoke, Va.—The Westover Dairy Co. will open an addition to their plant and will indulge in the manufacture of ice cream in the spring.

Richmond, Va.—The Horn Ice Cream Co. has purchased a $100,000 ice cream plant.

Spokane, Wash.—The Curlew Creamery Company of Curlew, Wash., will build an ice cream plant in Spokane in the spring. They also have a factory at Chewelah, Wash., and at Grand Forks and Nelson, British Columbia. John J. Helphrey, of Curlew, is president, Ira Carter, of Chewelah, is manager.

Monroe, Wis.—The J. Gempeler Company has purchased five cheese cellars of the Badger Cheese Company and will go into the manufacture of ice cream. The plant will be ready in about two months time. Jacob Gempeler, Jr., is principal owner and manager of the Gempeler Company.

Ashland, W. Va.—The Imperial Ice Cream Company of Parkersburg, W. Va., will also build a plant at Ashland, the contract has already been awarded. A. G. Sine is president of the company, W. M. B. Sine, general manager, Geo. W. Strong, vice-president, and J. H. Randolph is secretary and treasurer. The company has factories at Wheeling, Parkersburg, Clarksburg, Fairmont, Cumberland, Md., and Steubenville, Ohio.

Huntington, W. Va.—The Imperial Ice Cream Company of Parkersburg, W. Va., and operating a chain of factories in West Virginia, Maryland and Ohio, will begin the erection of a modern factory in Huntington immediately. A. G. Sine, Parkersburg, is president. The plant will have a daily capacity of 4,000 gallons and storage capacity of 12,000.

Antigo, Wis.—The Howe Creamery Company, which has been established in a portion of the old Citizens' Brewing Company building is now installing machinery for the manufacture of ice cream. O. W. Johnson is a member of the company. A ten-ton ice machine and a 40-quart freezer have been purchased, which will give a capacity of 400 gallons daily. An expert ice cream maker has been engaged.

Cumberland, Wis.—Officers of the company of the Cumberland Creamery announce that they will also manufacture ice cream in their new plant which is soon to be erected.

Kenosha, Wis.—A. C. Blommer, manager of the Blommer Ice Cream Co., of Milwaukee, Wis., opened a new branch factory which is one of the finest of its kind in the west, at Kenosha recently.

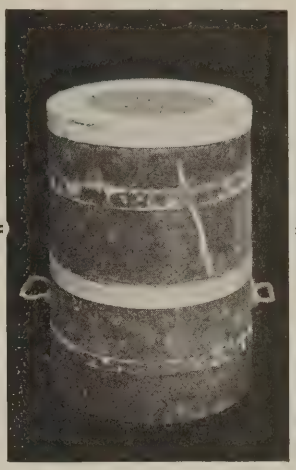
Milwaukee, Wis.—The Luick Ice Cream Co. is building a five-story addition to its plant.

Dallas, Texas.—The plants of Smith's Ice Cream factory and the Crystal Ice Cream Company have been purchased by the M. B. Ise Kream Co. of Waco, Tex., and the two Dallas plants will be consolidated under the name of M. B. Ise Kream Company of Dallas. A. P. McLendon is the president.

San Diego, Calif.—The Globe A-1 Grain and Milling Co. is branching out into the ice cream manufacturing business. They propose to operate a plant in San Diego. Three new plants will be erected, the principal new plant will be in Los Angeles. The president, Will E. Keller, has been interested in the manufacture of ice for some years past and his experience in the ice business led to the ice cream project.

Berlin, Wis.—The Berlin Ice Cream and Dairy Products Co., which has been operating in a factory building, is soon to have a new location. Other property has been purchased and a general renovation is in process preparatory to occupying the new place.

Waukon, Ia.—L. B. Stilwell purchased the Waukon Ice Cream factory from Thompson & Hansmeier. New modern machinery will be installed and the present equipment will be overhauled. The Purity Ice Cream Manufacturing Co. will be the name of the new company.



Forest City, Ia.—F. R. Ballentyne of Sioux Rapids will put in an up-to-date ice cream freezing plant equipment which will necessitate an expenditure of over $10,000 in his plant which will be established in Forest City.

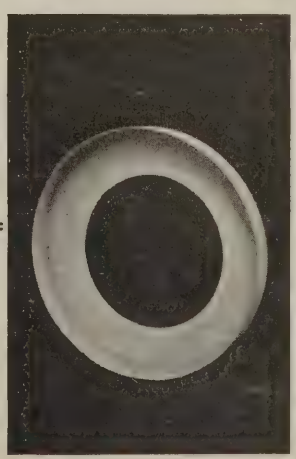
Minneapolis, Minn.—Installation of a new ice cream manufacturing plant at the University Farm at an approximate cost of $3,500 is now completed and the plant is in operation.

Fairmont, Minn.—The Fairmont Ice Cream Company has started a second addition of its plant. The new addition will be 20x30 feet with full basement and when completed will represent an investment of more than $5,000.

NEW STAFF MEMBER FOR MATHEWS COMPANY FROM PACIFIC COAST.

The "Servants to the Dairy Industry" announce that Miss P. A. Grant, of Vancouver, B. C., has recently joined their staff. Miss Grant has for some years past been advertising manager of the Fraser Valley Dairies, Ltd., of Vancouver, one of the largest milk distributing and ice cream manufacturing organizations on the Pacific coast. Prior to this connection she had been associated with advertising agency work, publishing and department store advertising. Thus she brings to her new work a useful fund of practical experience as well as a fine record for successful achievement, and the Frederick C. Mathews Company are to be congratulated on their policy of building an organization that not only knows the perplexing selling problems of the dairy industry, but also knows how to solve them.

Have Your Tubs This Protection?



When your packers are dragged along over rough concrete floors—flung around as so much junk by the express companies, and given innumerable severe bumps when unloading from trucks,—what is there to protect the bottom against the "springing" this vicious abuse sooner or later must cause?

The Roman Reinforcing Hoop Ice Cream Tub Protector is ample protection. A substantial metal rim that needs no tools to apply except those illustrated.

These Protecting Hoops have proved their worth wherever employed. They will do the same for you.

Write for circular and prices.

The B. L. Roman Mfg. Co.
608 Cherry Avenue, N. E.
Canton, Ohio

ANNUAL MEETING, NATIONAL DAIRY COUNCIL.

The National Dairy Council held its annual meeting December 1st, 1921. The meeting was held at the Auditorium Hotel, Chicago, and was largely attended. Representatives were there from every branch of the dairy industry. Considerable enthusiasm was manifest regarding the council work.

M. D. Munn, president, first of all outlined briefly the status of the dairy industry at the present time and the favorable financial conditions existing among dairymen compared with other interests of agriculture. Mr. Munn commented on the work of some of the manufacturers and dealers of socalled substitutes for dairy products featuring the need of the dairy industry to inform the public as to the truth.

Sealright Co. Exhibit at the Southern Exhibition, Atlanta.

Following Mr. Munns' report came the secretary's report which showed that the National Dairy Council during the past year has been co-operating with and supplying literature to more than 40,000 school teachers, Red Cross nurses, and other educational agencies and leaders.

The report showed that over four million (4,000,000) pieces of literature have been distributed by the National Dairy Council during the past year. Furthermore, the Council has participated in milk and dairy products campaigns in more than one hundred (100) cities, counties and towns. Among these are such cities as Philadelphia, Cleveland, Minneapolis, St. Paul, Youngstown, Canton, Bloomington, Trenton, Wilmington, and many others.

During the past year the National Dairy Council has prepared considerable new material including a series of four 24-sheet billboard posters with others in course of preparation; also three moving picture films and a series of moving picture slides; also three mechanical devices, one of which has been shown very extensively in which milk rings the bell.

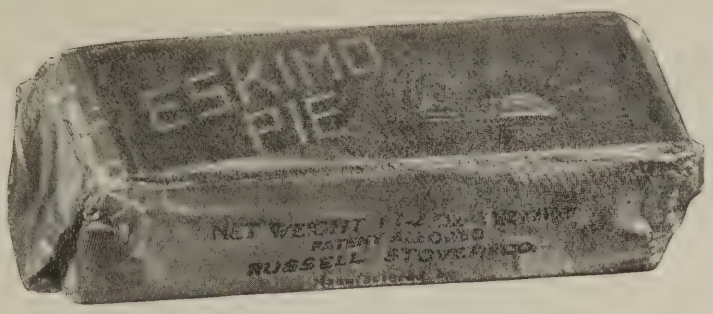
During the past year the National Dairy Council has had exhibits at numerous national conventions and some state conventions and fairs. The National Dairy Council had exhibits at the National Educational Association convention and the American Medical convention, Pageant of Progress, and the National Dairy Show, and numerous others.

Representatives of the National Dairy Council have spoken during the past year at over fifteen hundred (1,500) meetings.

The "Milk Fairies" play has been staged in over one thousand (1,000) schools.

There are now engaged in milk and dairy products campaign work thirty-three (33) National Dairy Council workers, twenty of them engaged in nutrition and education work, and thirteen in "Milk Fairies" work.

The National Dairy Council has been instrumental in organizing a system of serving milk in schools for health's sake, during the past year. Thousands of children are now being weighed and measured and taught health habits.



The work of the National Dairy Council, according to the Secretary's report now under way, consists of—

First, the organization and promotion of additional local dairy products campaigns;

Second, the continuation of national publicity through the schools, women's clubs, the press, and various conventions and meetings. Additional material will be prepared, one piece being a 32-page booklet by Dr. E. V. McCollum, entitled "Child Health Demonstration," and another booklet on butter.

Following this report came an address by Mrs. Ira Couch Wood, director of the Elizabeth McCormick Memorial Fund, a national organization promoting child health. Mrs. Wood spoke very complimentary of the work of the National Dairy Council and of the desire of her organization to work along hand in hand with the National Dairy Council. Mrs. Wood presented in a very pleasing and forceful manner the conditions of undernourishment and how to overcome them, outlining the general program of health for children.

Following Mrs. Wood came Miss Louise Fitzgerald, in charge of the National Dairy Council Nutrition and Milk Fairy Play workers, who outlined in a very instructive way the milk campaign work now being con-

Trade Mark Registered, U. S. Patent Office.
Patent Allowed Russell Stover Co., Chicago

What Is Eskimo Pie ?

Ask any one of these Ice Cream Manufacturers:

Luick, Benfelt, Mansfield and Blommer—*all of Milwaukee.*

Hutchinson Purity Ice Cream Company—*Des Moines, Iowa.*

Harding Cream Co., Fairmont Creamery Co.—*Omaha.*

Beatrice Creamery Company —*Dubuque, Iowa.*

THESE are but a few of the many ice cream manufacturers who have so far taken out a license from the Russell Stover Co. to manufacture Eskimo Pie.

Any reliable manufacturer of ice cream may secure license from us to manufacture Eskimo Pie.

Eskimo Pie will keep increasing your Winter Sales. The uniform contract provisions under which Eskimo Pie is sold standardizes the quality, size, shape and wrapper, and insures uniform selling prices and a satisfactory profit to retailer and manufacturer. No exclusive contracts granted.

Sooner or later you will be called upon to meet the demand for this product. Get in touch with us at once and enjoy the benefits of increased winter business.

WRITE

RUSSELL STOVER CO., Mallers Bldg., Chicago, Ill.

ducted by the National Dairy Council, using St. Paul and Minneapolis as examples.

After a brief recess for a dairy lunch, Mr. Robert Balderston, secretary of the Philadelphia Inter-State Dairy Council, spoke of the milk and dairy products campaign work being conducted in Philadelphia and surrounding cities. The campaign is financed equally by the producers and the dealers, each contributing 1 cent per 100 pounds on all milk sold or purchased. The campaign is conducted as all other campaigns—purely as a health measure, through the schools, women's clubs, and other organizations. The campaign is a **continuous** campaign.

Next came a very instructive talk by Dr. C. W. Larson, chief of the Dairy Division at Washington, D. C. Dr. Larson illustrated by graphic chart the trend of the dairy industry, and stated that the American nation should consume much larger quantities of dairy products than are now consumed. The United States ranks way down the list among nations in the consumption of dairy products. Dr. Larson commented very highly on the work of the National Dairy Council, stating that the secretary would have been unable to make a statement that 100,000,000 more pounds of butter were manufactured during the first ten months of 1921 than in the corresponding period of 1920, with less in storage now than a year ago, without the National Dairy Council having done some wonderful work.

Following Dr. Larson came Dr. E. V. McCollum, who gave a powerful talk on the need of using more dairy products in the diet. Dr. McCollum is recognized as the foremost authority on nutrition in the world today. He outlined very clearly and emphatically the present status of nutrition; also how earlier peoples lived and their daily diets. Dr. McCollum pointed out very plainly that if the American nation expected to maintain its high standard of mentality and physical development that it is very necessary that we, as a nation, consume more dairy products and leafy vegetables. At the close of Dr. McCollum's talk the large attendance present gave him a rising vote of thanks. President Munn referred to him as the "keystone" of the dairy industry.

The following were elected to constitute the board of directors: H. G. Van Pelt, W. B. Wanzer, E. M. Bailey, John LeFeber, H. S. Johnson, J. A. McLean, Frank Lowden, T. H. McInnerney, T. B. Lewis, W. F. Luick, J. A. Walker, A. E. Wilkinson, C. Bechtelheimer, H. E. McClintock, R. W. Balderston, W. P. B. Lockwood, E. M. Harmon, H. D. Wendt, S. H. Greene, E. S. Brigham, J. J. Farrell, A. E. Haecker, Mr. Engle, W. C. Davis, E. W. Chandler, C. M. Burdette, S. J. Van Kuren, W. S. Moscrip, D. D. Aitken H. E. Van Norman, Fred Pabst, M. D. Campbell, M. D. Munn, W. A. West.

The executive committee which was elected consists of the following: D. D. Aitken, A. E. Wilkinson, H. G. Van Pelt, W. C. Davis, T. H. McInnerney, John LeFeber, M. D. Munn, W. B. Wanzer, J. A. Walker.

The officers elected were as follows: President, M. D. Munn; vice president, J. A. Walker; treasurer, T. A. Borman; assistant treasurer, C. T. Hays; secretary, M. O. Maughan.

A summary of the financial report showed the following:

INCOME.

Milk Producers	$ 7,509.21
Butter Manufacturers	18,427.95
Milk Distributors	1,319.10
Ice Cream Manufacturers	3,037.00
Dairy Machinery Supply Dealers	32,966.70
Barn Equipment	200.00
Miscellaneous	100.00
Sale of educational literature	50,162.69
Total income for 10 months ending Oct. 31, 1921	$113,722.65

DISBURSEMENTS.

Preparation and distribution of literature	$42,519.41
Salaries and expenses of officers and field workers	26,101.96
Office labor	6,041.98
Stationery	678.56
Postage	1,430.92
Telephone and telegraph	872.65
Office supply and expense	428.25
Rent	3,819.28
Lights	82.40
Miscellaneous	34.23
Pageant, Shows, Exhibitions	3,759.22
Total disbursements for 10 months ending Oct. 31, 1921	$ 85,768.86
Leaving a balance to income account	$ 27,953.79

All present were of the opinion that the time is ripe for every man engaged in this industry to recognize the opportunities and possibilities lying ahead. Had it not been for the educational work conducted by the National Dairy Council and other organizations along similar lines, such as the Dairy Division at Washington, the dairymen would possibly be facing at the present time a financial crisis such as is being faced by the corn producers, the wheat growers, hog raisers, and by all other branches of agriculture.

The work of the National Dairy Council has a big future. The best move on the part of every man engaged in this industry is to support this big movement, which will mean increased profits for the industry and improved child welfare and national development.

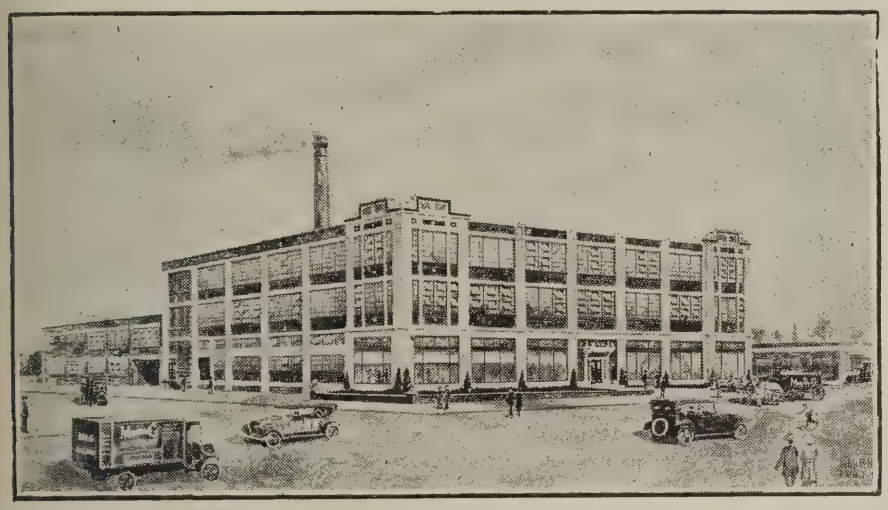
RUSSELL STOVER CO., PROMOTERS OF ESKIMO PIE.



Those who were not at the Illinois Ice Cream Manufacturers Convention at Chicago this month, have no doubt heard a lot about Eskimo Pie and many are wondering how this name and the product it represents sprung into the limelight of the ice cream industry so rapidly.

We are informed that a trade-mark registry has been secured for the name Eskimo Pie by the Russell Stover Company, havin goffices at the Mallers Building, Chicago. They are the promoters of the chocolate coated ice cream bar under this name, contracting with ice cream manufacturers for the use of it. Ice cream manufacturers interested in this product can learn more about it by writing the promoters.

PACIFIC ICE CREAM MANUFACTURERS HOLD SIXTH ANNUAL CONVENTION.

The sixth annual convention of the Pacific Ice Cream Manufacturers' Association, held at the New Washington Hotel, Seattle, Wash., November 14, 15 and 16th was a rousing success.

Twenty-two new members were added to the association at the time, while fifteen additional came in since the meeting a year ago, and that is "going some" for that territory. Four of the new members are Canadian manufacturers, which speaks well for the friends across the line, and there was a very nice delegation from California also.

Proposed Plant of the M. & G. Ice Cream Co., (See Page 60).

The attendance was fine and the convention program was quite up to the previous year's program at Portland, while the entertainment far surpassed it. There was nothing undone to make the members and guests feel at home and the Seattle ladies' committee were wonderful hostesses to the visiting ladies.

A little disappointment was felt at not having some of the speakers present; illness prevented a few appearances.

Monday morning's session began with registration. This was followed by "America" preceding the address of welcome to Seattle given by Mayor Hugh M. Caldwell; response by F. N. Martin; president's address by J. E. Dunne; report of the secretary by Bert H. Walker; report of the treasurer by A. F. Bird and the appointment of committees.

The afternoon session opened with a speech by Paul Heath of the Heathmade Carbonated Products Company, Chicago, Ill., "A Year's Progress." A. R. Fernald of the Frederick C. Mathews Company of Detroit, Mich., chose "Broad-Minded Advertising" for his subjest. Nettie May Miller, of Oakland, Calif., contributed "A Talk by a Silent Partner."

In the evening "The Ice Cream Mix" met in the hotel and were conveyed in automobiles to the Seattle Yacht Club, where informal dancing was enjoyed.

Tuesday's session began in the morning by a talk, "Silent Salesmen in Ice Cream," by W. R. W. Nichols of Garrett & Co., San Francisco, Calif.; followed by "Creating New Business," given by H. C. Stokes of the Stokes Ice Cream Company of Seattle, Wash.; W. P. Abel of the Impruv-Mix Company, New York City, spoke on "Ice Cream Improvers—Do They Improve?" "California's Fight Against Selling Ice Cream by Weight," by Robert J. Dryden of the Dryden Corporation, Oakland, Calif., was a paper read due to Mr. Dryden's inability to attend. "Long Distance Delivery by Auto and Its Cost," was handled by W. C. Robb of the Puyallup Ice Cream Company, Puyallup, Wash.

Tuesday afternoon's session was ushered in by "The Ice Cream Business in Idaho," by J. R. Brown of the Farmers' Co-operative Creamery, Payette, Idaho. This was followed by "Importance of Progress in Applied Refrigeration," by J. C. Corbin of Seattle, Wash., Henry W. Stern of A. Daigger & Co., Chicago, Ill., spoke on "How to Put Pep Into Production and Profits." Mr. L. O. Thayer of Delft Gelatine Co., New York City, was unable to attend, but sent in his paper on"Let's Understand Gelatine." "Consistency, Thou Are a Jewel," was given by Frank Flood of the Broadview Dairy, Spokane, Wash. "Cabinets, Containers and Re-Icing," was chosen by E. C. Schmidt for his talk. Mr. Schmidt is with the Mutual Creamery Co. of Seattle.

Tuesday evening the ladies were entertained at a theater party and the men adjourned to the Automobile Club, where the supply men and western Washington ice cream manufacturers were the hosts at the biggest night, it is whispered, ever featured at an ice cream men's convention.

Wednesday morning's session began with "Echoes from the National Convention," by F. N. Martin of the Hazelwood Company, Ltd., Spokane, Wash. Then followed "Modern Accounting Methods in Ice Cream Industry," by C. B. Terwilliger, a certified accountant of Portland, Ore. F. E. Miller of the Miller Creamery Company of Oakland, Calif., favored with "Co-operation With the Public." Dr. S. A. Huntington selected "Knowing Milk for Quality's Sake." Dr. Huntington is connected with the Royal Ice Cream Company of Tacoma, Wash. Wyn Morris of Barker, Duff & Morris, Pittsburgh, Pa., gave a speech on "Observation," and the speech of "Bacterial Control," given by E. G. Emery of Bellingham, Wash., ended the morning program.

At the afternoon session on Wednesday the report of the auditing committee was given, followed by the reports of the resolutions committee and nominating committee. The election of officers was as follows:

W. V. S. Robb, Seattle, Wash., president; G. W. Weatherley, Portland, Ore., first vice-president; D. M. Dorman, Los Angeles, Cal., second vice-president; A. F. Bird, Seattle, Wash., third vice-president; Bert H. Walker, Tacoma, Wash., secretary; Jay H. Kugler, San Francisco, Cal., field secretary.

The directors are: W. V. S. Robb, Seattle, Wash.; G. W. Weatherley, Portland, Wash.; F. N. Martin, Spokane, Wash.; J. E. Dunne, Portland, Ore.; A. F. Bird, Seattle, Wash.; G. S. Helphrey, Sand Point, Idaho; H. B. H. Hirsch, Butte, Mont.; V. A. Sampsell, Billings, Mont.; S. J. Simonson, Yakima, Wash.; H. C. Stokes, Seattle, Wash.; D. M. Dorman, Los Angeles, Cal.; Bert H. Walker, Tacoma, Wash.

The annual banquet of the Pacific Ice Cream Manufacturers' Association was held on Wednesday evening and a full evening of royal entertainment completed the very successful convention given by an association which Bert H. Walker, the secretary, still maintains is the best state association in the country. It will be our pleasure, in subsequent issues, to publish some of the addresses delivered at the convention.

HELP WANTED

WANTED—Ice cream maker; capable man, who understands manufacturing; good opportunity for hustler. Would prefer one who could invest to some extent. Write fully experience, age, etc., in first letter. Address: R-87, Ice Cream Review. 12-21

"LIVE WIRE" not afraid of work who thoroughly understands the game, is open for engagement. If your business is in a run-down condition or competition too keen, I'll put it on a paying basis again. Will locate anywhere. Address: R-88, Ice Cream Review. 12-21

WANTED MANAGER—A practical ice cream man in new up to date factory in city of 40,000 in Oklahoma. Must thoroughly understand ice cream business and be able to invest two or three thousand dollars in business. Address: R-106, Ice Cream Review. 12-21

HELP WANTED—Fine opening for young man with capital enough to make him interested. Must know manufacturing and selling end of the ice cream business. New refrigerating plant, capacity 350 gallons, value $15,000 unencumbered. Three railroads. One-half block from express office. Ten thousand people within four miles. Richest fruit and trucking section in Florida. Owner more interested in other business and wants to be away at least three months every summer. Will eventually turn over entire management. More machinery needed for making commercial ice cream. Present business principally retail and family. Explain fully your qualifications, how much money you could put in business and wages expected to start. Sias Ice Cream Company, Bradentown, Fla. 12-21

SALESMEN WANTED—An opening in several desirable territories—established line to wholesale ice cream manufacturers—worth while opportunity for A No. 1 men who are two-fisted fellows with money-making ability. Give complete details in first letter. Chicago factory. Address: R-89, Ice Cream Review. 12-21

WANTED—Position with party contemplating the installation of dry milk machinery; 8 years' experience in installing equipment and condensing and drying of milk. Address: R-91, Ice Cream Review. 12-21

ADVERTISING MAN—Competent to handle the advertising for an ice cream concern. Must be qualified to edit copy, analyze conditions, create ideas and follow up advertising leads. At present all copy is prepared and campaign directed by an agency. Material is bought from various sources. Give previous experience, qualifications, age, references and salary expected in first letter. Address: R-95, Ice Cream Review. 12-21

PRODUCTION SUPERINTENDENT—An ice cream concern with several plants throughout the South requires the services of a man competent to inspect and superintend the manufacturing at the various plants, which necessitates being away from home at least four or five days every week. He must know the ice cream business and freezing methods thoroughly and be able to figure solids, fat and overrun. This is a man's job with plenty of opportunity for promotion. State experience and qualifications in detail in first letter, also age, whether married or single, references and salary expected. Reply to R-96, Ice Cream Review. 12-21

SALESMEN WANTED—Some desirable territories are open in the East and Middle West states for the sale of the "Glacifer Dry Packer for Shipping Ice Cream." Commission business only, with protected territory. For the present it may be handled as a side line. We want an unusually high type of salesman who can produce results. Acquaintance with the trade desirable, but not necessary. Interviews will be arranged after January 1st. Tell us all about yourself in your first letter, which will be treated confidentially, what you have done, are doing and territory now covered. The Glacifer Company, 102 Merrimac St., Boston. 12-21

WANTED—First class salesman to sell a full line of materials to ice cream and candy manufacturers. Great opportunity for man who is able to produce. The Wexmar Co., 2712 Montrose Ave., Chicago, Ill. 2-22

POSITION WANTED

HIGH GRADE ICE CREAM MAKER, capable all around dairyman, open for engagement. Thirty years' practical experience, expert on testing, standardizing, pasteurizing milk, cream. Thoroughly experienced in all departments inside, and outside work, steam, refrigeration; good mechanic; reliable; best of references. Will guarantee to save and make you money in your plant. Desire position with reliable firm. Address: R-48, Ice Cream Review. 7-21tf

POSITION WANTED—By thoroughly experienced person who understands modern methods of ice cream making, as superintendent or ice cream maker. Address: R-68, Ice Cream Review. 12-21

POSITION WANTED—By up to date ice cream maker. Wholesale or retail. Understands all methods, also care of cold storage plants. First class references. State wages in first letter. Address: Wm. Williams, Necedah, Wis., Box 183. 12-21

POSITION WANTED—As a well known member of Supply Men's Association I cannot openly lend my name to recommend a man for managerial and buyer's position, but I have in mind a man who knows as much all around about the scientific and practical side of the retail milk and wholesale ice cream city and country as any manager I have met in 25 years travel all about the country, he is of the highest type of executive. He is well situated but might make a change of location, 29 years' experience. Nothing under $7,500 or $10,000 considered. Address: R-92, Ice Cream Review. 1-22

POSITION WANTED—By ice cream maker with broad experience in large plants. Good references. Address: R-94, Ice Cream Review. 12-21

POSITION WANTED—By a man with seven years' practical experience in making commercial and fancy ice cream and sherbets. Have just completed a contract with a plant in a large Texas city, where the output was 1,200 gallons daily. Am experienced in the use of all machinery used in modern plant, including refrigerators. Can furnish references regarding abiuity to handle the help found in modern plants as well as the making of a real quality product. Write H. M., 200 Bird St., San Angelo, Texas. 12-21

POSITION WANTED—As superintendent or plant foreman in up-to-date ice cream or combination plant. Understand all latest methods in mixing, freezing, homogenizing, pasteurizing, testing, standardizing and refrigeration. Dairy school course. Married. Age 28. Can come on short notice. Best references. State salary and describe plant in first letter. South preferred. Address: R-100, Ice Cream Review. 12-21

POSITION WANTED—As ice cream maker; 10 years' experience. Capable of handling 3,000 gallons a day. Address: R-101, Ice Cream Review. 1-22

POSITION WANTED—By an ice cream maker, who knows the business in all of its branches. Also ice making and refrigeration, in all of its branches. Can come on short notice. W. A. Waring, Barton, Md., Box 51. 12-21

POSITION WANTED—Ice cream maker and general creamery man of ten years' experience would like position as ice cream maker or take charge of plant. Can also handle refrigeration machinery. Address: R-103, Ice Cream Review. 12-21

POSITION WANTED—As an ice cream maker or superintendent; 25 years' experience in the business; expert at brick ice cream, also good salesman. Address: R-107, Ice Cream Review. 12-21

WANTED TO BUY—Established ice cream plant. Middle west preferred. Describe fully in reply. Address: R-90, Ice Cream Review. 1-22

"YOUNGEST WOLF HOUND" NOW HAS A BABY SISTER.

At the last annual meeting of the Oklahoma Wolf Hounds "the youngest wolf hound in captivity," Master Benjamin Ralph Hauk, was duly initiated. "Ben" has been revelling in his honors but now he must at least share them with a baby sister who came to visit him on Nov. 21st and who evidently intends to stay. Ben and the new Wolf Houndette make their home with Mr. and Mrs. C. R. Hauk, of St. Louis. Congratulations, folks!

COPY OF TELEGRAM TO SECRETARY OF WOLF HOUNDS.

Fort Worth, Texas, Dec. 10, 1921

Mr. DeRoache, Sec. Oklahoma Wolf Hounds,
Oklahoma City, Okla.

After full consideration am compelled to resign my position as official. Nurse of Wolf Hounds.

Noting the new addition to the Hank family I do not feel that I can do the position justice. Have a white elephant on my hands here in Texas.

Suggest that a committee of six, with Pete Miller as chairman be appointed to assume duties of the position I have had honor to hold.

M. S. PENNYPACKER.

ILLINOIS ICE CREAM MANUFACTURERS HOLD CONVENTION.

The Illinois Association of Ice Cream Manufacturers held their twenty-second annual convention in the Sherman Hotel, Chicago, Ill., December 6-7. The attendance was large and the program was an interesting one. The following officers were elected: L. W. Roszell, Peoria, Ill., president; A. D. Cunningham, Chicago, Ill., vice president; N. Loewenstein, Chicago, Ill., secretary; E. L. Joehl, Alton, Ill., treasurer.

The directors are: The officers, F. W. Holmes, Manteno, Ill.; A. A. Chapell, Chicago, Ill.; G. E. Thompson, Chicago, Ill.

National Director: W. A. Schwindeler, Quincy, Ill.

A more complete report of the convention proceedings will be published in the January number of The Ice Cream Review.

FOIL WRAPPERS FOR ICE CREAM.

With the advent of ice cream being sold in the popular "chocolate bar style," a new field is also opened for the foil wrapper. Much experimentation was necessary to make foil wrappers adaptable to the various products they were intended to wrap.

Today aluminum foil, on account of its lightness and inherent nature that keeps it from rusting, has probably found its widest use for wrapping confections and food products.

The Milwaukee Printing Company, with offices and a modern equipped plant at 377 Florida Street, Milwaukee, Wis., have developed a large line of wrappers for the confectionery and food trade known as "Radio" wrappers and the progressiveness of this concern will no doubt secure a good share of the wrapper business resulting from this new departure in the ice cream industry.

WHY THE KANSAS MEETING WAS POSTPONED.

The Ice Cream Review:

Owing to a small pox epidemic which prevails in Kansas City, the convention of the Kansas Association of Ice Cream Manufacturers has been postponed until some time in January.

B. T. PERKINS, Secy.,
Kansas Assn. of Ice Cream Mnfrs.

Davis-Watkins
Catalog No. 6

This catalog is the result of many years work, and the experience of many men, working together to build the best milk handling equipment which can be, and is produced. The information recorded is that of experts in each line. If you operate a milk plant, creamery or ice cream factory, you should have it handy.

Here is a list of the Sections:

SECTION ONE	Milk Cans, Ice Cream Cans, Can Washers, Can Fillers, Can Strainers, Dippers, Brick Moulds, etc.
SECTION TWO	Bottle Fillers and Cappers, Valves, Rubbers, etc.
SECTION THREE	Milk Pasteurizers, Heaters, Holders, Coolers, Coil Vats, Milk Tanks, Receiving Vats, etc.
SECTION FOUR	Pressure Bottle Washers, Small Washers, Turbine Washers, Brush Washers, Tanks, Brushes, etc.
SECTION FIVE	Milk Pumps, Sanitary Fittings, Bottle Cases, etc.
SECTION SIX	Butter Churns and Workers, Cream Ripeners, Batch Pasteurizers, Starter Cans, Weigh Tanks, Testers, etc.
SECTION SEVEN	Small Butter Making Outfits, Churns and Workers, Printers, Cartons, Coolers, etc.
SECTION EIGHT	Ice Cream Freezers, Homogenizers, Batch Mixers, Emulsors, Brine Outfits, Carton Fillers, etc.

Perhaps the complete catalog contains many things you are not interested in. With this in mind we are also printing the eight sections in separate books. You can have the whole catalog in one book or any of the several sections. It is up to you to tell us what you want sent.

If one or more of the Sections will answer your purpose, we would prefer to send them, as the complete catalog costs us more money. However, if you are interested in all that pertains to milk handling, you should by all means have a copy of the complete catalog so you can study it over as you have time.

Write us on a postal card or in a letter: "Send me the Davis-Watkins Catalog No. 6" or "Send me Sections ....."

JANUARY 1922

IT'S a little late to talk about New Year resolutions, and to wish you a Happy New Year, but that isn't the editor's fault. New Years comes too early. However, we are still sentimentally reminiscent, but we are not counting the mistakes of last year—simply because we don't believe in that sort of thing. We would rather build air castles any time than to worry about last year's errors. So we are wondering what 1922 has in store for the men in the ice cream industry.

That probably depends a good deal upon us. Business prophets are all telling us that the new year is going to bring about a big revival in business and that we are about due to get "out of the woods," so to speak.

We have a "hunch" that these fellows are right, but we advise the man who wants more business in 1922 not to expect that Dame Fortune is going to come along and throw it into his lap of her own free will and accord. Conditions are not going to change so much and so good that business is going to come very fast for the man who doesn't hustle for it.

We believe, however, that the man or the firm who goes out after business the way business men used to go after it before the world war, will get it. The war spoiled lots of folks. Business came so easily that they didn't have to hustle for it. Then the reaction came in and the change was so violent that they gave up. They are still waiting for "good times" to come back. The kind of "good times" they are looking for will not come back unless another war comes on. We believe that normal, honest-to-goodness good times are just ahead, but we have got to hustle if we catch up with them.

The ice cream manufacturer or the ice cream supply man who wants to do a bigger business in 1922 than ever before can do it if he plans accordingly. The business is in sight, but he must go after it "hammer and tongs."

THE elimination of the government tax on soda fountain sales will undoubtedly result in increased sales of ice cream. This increase may not be marked on account of unfavorable business conditions, but as the situation improves tax-free ice cream will surely find favor among the consumers of the country. The kid who has been hanging on to his nickel waiting for Dad to give him another penny so that he can buy a cone has no occasion to wait longer. He will not get a nickel as often as he once did, but the old times will return and the consumption of ice cream cones will again help to swell the total.

We believe that there never was so good a time before to push the sale of good ice cream. The tax barrier has been removed and it was more than a financial barrier—it was a sentimental barrier as well. There is no question but what the consumer of ice cream resented this tax more than other forms of taxation. The action of many retailers in boosting their profits, using the tax as an excuse, helped to aggravate that resentment. People refrained from buying ice cream cones and ice cream dishes many times because they felt they were being imposed upon.

Now, with the tax removed, old time prices will return, as a general thing, and consumers will feel that they have won their fight. They will spend their money more freely and will be boosters for ice cream instead of being enemies.

The progressive ice cream manufacturer is going to take advantage of this changed attitude on the part of the buying public to "sell" his ice cream in every way at his command. He will spend more money on advertising than he ever did before. He will "sell" ice cream in general to his people and will then "sell" his particular brand of ice cream. If he backs it up with quality and service he stands to win great results. We believe the time is ripe for such an advertising campaign in every community. Don't wait until hot weather to do it, either. Get your people in the habit of eating ice cream as a food and a dessert, not merely to cool themselves off in hot weather.

THE next few weeks will conclude the series of state conventions that are being held over the country. If your state convention is still ahead, don't let anything short of sickness keep you from being there. It will be time and money well invested.

THE ice cream manufacturers in a few of the states in the Middle West set apart only one day in the year for a convention. They reach town in the morning and take a train home in the evening. They spend the hours between talking business. They call it a day and go away.

Now, we believe in attending to business during business hours, but this kind of an arrangement doesn't leave any time for play and social intercourse. Yes, that's it, we are arguing for a two or three days' convention and we believe it is the proper thing to do. "All work and no play makes Jack a dull boy," and a convention that doesn't afford opportunities for the delegates to loosen up a little and be sociable is—well, it isn't our idea of a real ice cream manufacturers' convention.

Ask the Texas ice cream manufacturer, for instance, when he arrives, whether he could get done in one day. He would probably tell you that a three days convention is none too long and he wouldn't bother to leave home for a one day's meeting. The Oklahoma man would tell you the same thing. These men would ask, "How about the White Caps and the Longhorns and the Wolf Hounds, where would they come in?" The man in Kansas would tell you that a successful convention would be impossible without the Jack Rabbits. Then there are the Cornhuskers in Nebraska, the Poodle Dogs in Iowa, the Badger Flyers in Wisconsin, the Hoosier Wild Cats in Indiana, and the Dairy Boosters in Michigan. No ice cream manufacturer in those states would want to attend a convention without them.

These auxiliary associations are impossible in those states where a one day's meeting is held. They operate only during play hours and these play hours are essential to the best interests of the ice cream manufacturers' association. Of this we are firmly convinced and we suggest to the officers of those state associations where one day meetings are held to enlarge their program next year and use at least two days. The Ice Cream Review stands ready to help you in any way it can to make your annual convention a bigger thing. It will increase your attendance and increase the usefulness of your organization.

WHEN the secretary of your association asks you to "please remit" for your dues it is well to keep in mind that right there you can help him in the good work he is doing. We realize that for the "jiner" this is the most expensive time of the year. In addition to the holiday demand upon his suffering wallet, his dues are due. He gets a notice from the secretaries of the various lodges, clubs and associations to which he belongs that his membership will be worth just about as much as a last year's bird's nest if he doesn't pay up within a certain definite period. Of course the information is conveyed to him in more brotherly language, but it means the same thing.

When you get a notice from the secretary of your trade organization give it "preferred position" among the pile of bills that you intend to pay when you have recovered from the demands of Christmas time. Don't let your membership lapse or even worry the secretary with a delay. When he is spending time trying to collect delayed dues he can not be spending time doing constructive work for you and for your organization. The most encouraging message of all the year that it is possible for you to send him is, "Here are my dues."

ESKIMO PIE." Who hasn't heard about it? Surely no ice cream manufacturer. Probably nothing since the advent of the ice cream cone and the ice cream sandwich has stirred up a like interest, not only among ice cream manufacturers and retailers, but among all classes of consumers as well.

Some folks think that chocolate covered ice cream is but a passing fancy and hesitate to adopt it as a regular product, but we feel they are making a mistake. We are strongly in favor of any product that will mean a larger consumption of ice cream and enable the ice cream manufacturer to run his business at a loss a less number of months during the year. One large ice cream manufacturer testifies that the manufacture of Eskimo Pies enabled him to show a profit in December, the first time in the history of his business.

Why not use such a legitimate means of increasing the consumption of ice cream? Why not give the people what they want, especially when it can be done at a good profit? We believe the ice cream manufacturer who does not seize upon every opportunity to develop his business is standing in his own light.

IN THE Ice Cream Review office we feel that this issue if just about the most interesting one that we have ever pubilshed. Notice the volume of news regarding the activities of the various associations of ice cream manufacturers and of the supply men. Pages and pages of live reading matter of real interest to the men in the business. We call special attention to this issue, not to pat ourselves on the back, but to make sure that you will not let the size of the paper discourage you from reading every page carefully. Each page has something that will interest you.

BULLETIN OF EVENTS

Wisconsin Association of Ice Cream Manufacturers, Annual Convention, Hotel Plankinton, Milwaukee, Wis., January 17-18, 1922. F. E. Caughey, Secretary, Madison, Wis.

Louisiana Association of Ice Cream Manufacturers—Annual Convention, New Orleans, La., Jan. 19, 1922. Headquarters hotel to be announced later. N. F. Manning, Monroe, La., Secretary.

Minnesota State Association of Ice Cream Manufacturers—Annual Convention, Hotel St. Paul, St. Paul, Minn., Jan. 20, 1922. W. M. Paulson, Minneapolis, Minn., Secretary.

Association of Ice Cream Manufacturers of Iowa—Annual Convention, Cedar Rapids, Jan. 24-25, 1922. P. W. Crowley, 709 Citizens National Bank Bldg., Des Moines, Secretary.

Kansas Association of Ice Cream Manufacturers—Annual Convention dates changed to January 26-27, 1922. B. T. Perkins, Secy., Pittsburg, Kans.

Ohio Association of Ice Cream Manufacturers—Annual Convention, Deshler Hotel, Columbus, Ohio, Jan. 31-Feb. 1, 1922. Arthur S. Burket, 509 Outlook Bldg., Columbus, O., Secretary.

Michigan Allied Dairy Association—Annual Convention, in Municipal Auditorium at Saginaw, February 14, 15, 16, 17, 1922. H. D. Wendt, General Secretary, Lansing.

Nebraska Association of Ice Cream Manufacturers—Annual Convention, about April 1, 1922. Room 4, Chamber of Commerce Building, Lincoln, Nebraska. R. W. McGinnis, Secretary and Treasurer, 1024 O Street, Lincoln, Nebraska.

Wisconsin's Convention at Milwaukee Expects Large Attendance

We've written up so many conventions for this issue and now that we are down to the last one (and it's far from being the least important — being in the "home town") we've nearly run out of gas. Chap at the next desk suggests that we try ether—but this not being a dental parlor — suggestion was "scrapped."

The main idea is to urge you all to attend—the best way, in our estimation, to get all you fellows and your wives over to this "Ex-Beer" city of ours for a nice little vacation trip and the best time ever to get some of the newest ideas in the ice cream industry—is to call to your attention the BADGER FLYERS "Rogues' Gallery" we have printed in this issue of THE ICE CREAM REVIEW for your special pleasure. These are the men you all want to meet—they are the boys who will be able to help you out in the coming heavy ice cream season, they are the ones who will help swell the all-year sales in ice cream in the state of Wisconsin.

When the spacious mezzanine floor of the Hotel Plankinton throws open its portals and session halls for the opening meeting of the Wisconsin Association of Ice Cream Manufacturers—we want you all to be present when the roll is called—in fact, we want it to be so crowded that we shall be obliged to seat some outside the doors—nothing will please us more. Don't disappoint us, for we have YOU particularly pictured in mind and we shall miss you even before the roll is called if you don't attend. Don't forget the dates—January 17-18. Don't forget the place — HOTEL PLANKINTON. Don't forget the city—MILWAUKEE. And last, but not least—DON'T FORGET THE LADIES. We have something in store for their entertainment—something they will like and enjoy, and now that Christmas is over, you fellows will be on the safe side.

City Hall Square With City Hall.

Next to New York and Chicago, MILWAUKEE is the greatest convention city in America. We entertain many conventions; you have read all about them in the newspapers. We are now perparing to entertain you; don't dis-

appoint us for we have planned long and hard for your benefit and entertainment.

During the twelve months from September 1, 1920, to September 1, 1921, Milwaukee entertained 346 conventions, the total attendance at these conventions was 527,230 persons. We want the ice cream manufacturers and supply men of the state of Wisconsin, and all other states, are also very welcome, to co-operate with us and help make this 1922 meeting one long to be remembered. Never was the opportunity to do good for the association members and other fellow manufacturers of ice cream of the state of Wisconsin, who, we hope, will soon join our association, better than at the present time of the reconstruction of business conditions. Ice cream making has grown to be a mighty powerful industry and there are problems which come up from time to time which must be made clear to the manufacturer if he is going to make his ice cream of a better grade — these problems find the real place for discussion in no better place than right in the convention meetings. We cannot urge upon you strongly enough to attend so that you may be benefited by the many valuable suggestions that are offered at just such meetings as these conventions afford. It is very vital to the success of your business that you attend. The association is constantly on the alert to help its members—that is what these organizations are for—surely once a year is not asking too much of you manufacturers to come to the convention—they are for your benefit and for your good.

The Court of Honor, Grand Avenue.

Milwaukee is the metropolis city of Wisconsin—noted for its hospitality, good cheer and excellent accommodations—you will find your visit here very enjoyable—the city offers no end of entertainment, and right at the convention on the evening of the 17th of January, we promise you a big surprise—don't fail to attend—we are not letting the cat out of the bag but are keeping it all a dark secret in hopes that it will offer a little inducement for YOU to come. We promise you four hours of the finest entertainment you have ever had the pleasure of witnessing, and if you don't come you'll be sorry when the other fellow comes back and tells you about the fine time he had.

The Hotel Plankinton, convention headquarters, is one of Milwaukee's better hotels, noted for its hospitality, just rates and the rule that guests must be pleased. You will find its spaciousness and elegance pleasing to the eye—you will enjoy eating in the beautiful Sky-room which boasts of the best grill-room orchestra in the city of Milwaukee.

Directly opposite the Court of Honor pictured in connection with this article, you will find a public museum which is considered one of the finest in the world. The ladies will enjoy a visit there—they can linger for hours and see interesting things which have been salvaged from out of the ages.

Every ice cream manufacturer who is a member of an ice cream manufacturers' association will agree that the benefits he has received from belonging to the association have been a most wonderful factor in helping him to increase his business to the proportions that it now has attained. A prominent president of a certain association of ice cream manufacturers once made the remark that "he has never come away from a conven-

Once Again Our

"NO-SWET" CABINET

has proven to be the most efficient and economical Cabinet for Ice Cream Manufacturers. At the Atlanta Show, the Jessup and Antrim Ice Cream Company of that city attended all cabinets used and gave it as their unbiased opion that our Cabinets were superior to all others. For low even temperature and perfect refrigeraation coupled with minimum comsumption they stand supreme. Add to this the "None-Swet" feature and and what more is desired.

They are made in a modern factory in Grand Rapids "The Furniture City" where skilled woodworkers are the rule. Standardization and the latest type machinery enable us to produce them at competitive prices.

tion without feeling that the benefits he had received from meeting the wonderful aggregation of enthusiastic and successful ice cream manufacturers did not fill him with enthusiasm and make him fully believe that he was connected with one of the greatest industries in this great United States of America.'' The manufacturer who does not avail himself of the opportunity of attending his state convention is not doing himself or his business justice. Every live ice cream manufacturer in the state will be in Milwaukee for the 17th and 18th of January—every man that is alive to his opportunity will be found in attendance—every man, young or old, who wants to get out of his rut should be found at this convention—every man who wants to broaden his vision in order to serve his customers better will be found among us on these dates. We promise him food for thought.

THE STATE CONVENTION is the place to meet and exchange views and get the latest ideas from the most progressive people in the ice cream line—every manufacturer will be well repaid by attending. A prominent man who has been president of a southern state association of ice cream manufacturers stated that ''he would probably be working at one tub and can today had he not attended conventions and heard the men who know, speak.'' Therefore, we invite all you one tub and freezer ice cream manufacturers to the convention that we may help you grow, and you bigger fellows in the industry, we want you, too, so that we may help you grow even bigger. WE'LL SEE YOU AT THE CONVENTION IN MILWAUKEE ON JANUARY 17-18!

* * *

P. Courtesy of the Hudson Manufacturing Company of Chicago, Ill., is as courteous as his name for didn't he send us the last picture of himself for this issue of The Review? He's a well-known Badger Flyer and will be on deck at the Wisconsin convention in January like a rubber duck and will take your orders for flavors in the politest manner you ever witnessed for will not your order by signed ''Courtesy?'' Come over to the convention, all you Wisconsin ice cream manufacturers, and get better acquainted with the Sunday manners of all these regular fellows and see what a good time they can show you—for remember so far you have seen only the business side of these chaps. We promise you a humdinger of a time and we'll guarantee you won't regret the trip.

* * *

J. T. Purves, representative out of Appleton, Wis., for the Creamery Package Company of Chicago, will be at the Wisconsin convention of ice cream manufacturers which will be held at the Plankinton hotel on January 17-18. We certainly appreciate the way these boys turned out in sending us their photos—and most of those sent were the only ones the family possessed and we appreciate the favor of loaning them to us all the more for that reason. Take the case of J. T., for instance—they only had the one in existence—but they kindly sent it to us admonishing us to take extra care of same and to carefully preserve and return to Mrs. J. T. We did that—and we are patiently waiting for the convention date so that we may compare this good looking picture with said gentleman and then tell him he hasn't aged a bit since we last saw him (incidentally we are going to bump his hip at the same time). Get us?

* * *

Do you know who the boy is in the bag of salt? Of course you do recognize H. O. Fitch who travels out of the Milwaukee territory, representing the Morton Salt Company of Chicago, Ill. And he's a Badger Flyer, too, and he's flying over to the Wisconsin ice cream men's convention at Milwaukee in January, and we'll be glad to see him. We only ask that he doesn't come salted like he is in the picture—now this isn't an invitation to come pickled instead of salted—we only meant that we don't want anyone salted down at the convention—we want them to lay aside all cares and enjoy the excellent program that will be in force at the ''doings.'' We are going to have a nice program of acts in singing and dancing and won't Harry come out of that bag of salt life size, though, when he sees them!

* * *

J. G. Cherry Company boys, who are Badger Flyers, will be at the Wisconsin convention and they're a lively crowd too—and if you haven't met these ''cherries'' before you'll certainly have to meet them then. There's A. W. Campbell, who travels out of Beaver Dam, Wis., and W. R. Maguire (NOTICE: W. R. the Sidekick got your name correct this time, eh?) who travels out of Milwaukee, and then there's the honorable president of

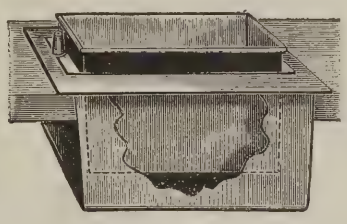
THE C-B CALENDAR

We Can Supply You With Everything Needed to Make Eskimo Pie

Let us help you get into the manufacture of Eskimo Pie, the latest ice cream confection. It requires very little in addition to your present equipment to make these delicious bars of chocolate coated ice cream.

Chocolate Melting Pan

To cut up the frozen ice cream into bars, there is nothing more suitable than the New Era Brick Cutter. It is an inexpensive machine, very simple in construction and operation and a fast worker. A direct connected motor or a belt supplies the motive power.



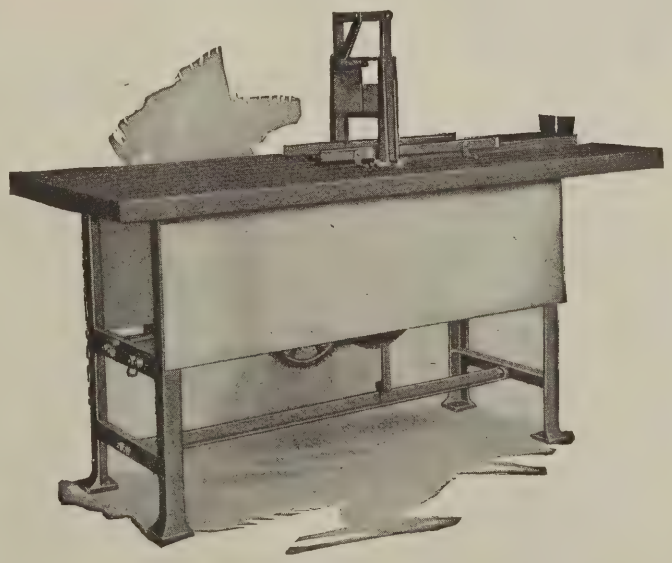


Table Dipping Chocolate Pan

Your present brick slabs can be used if you choose, or we can promptly supply you with special shallow slabs of heavy tin.

To prepare the chocolate coating a melting pan is needed. It may be possible to utilize your gelatine melter for this, or we can outfit you with a regular chocolate pan.

Finally you must have a table chocolate pan for dipping. Our pans can be fitted into any table; steam or electricity furnishes the heat.

Write us at once. Let us tell you just how the New Era Cutter handles the cutting. Let us explain fully about the other equipment. Act at once; the Eskimo Pie idea is taking a tremendous hold on the public. We will reply promptly.

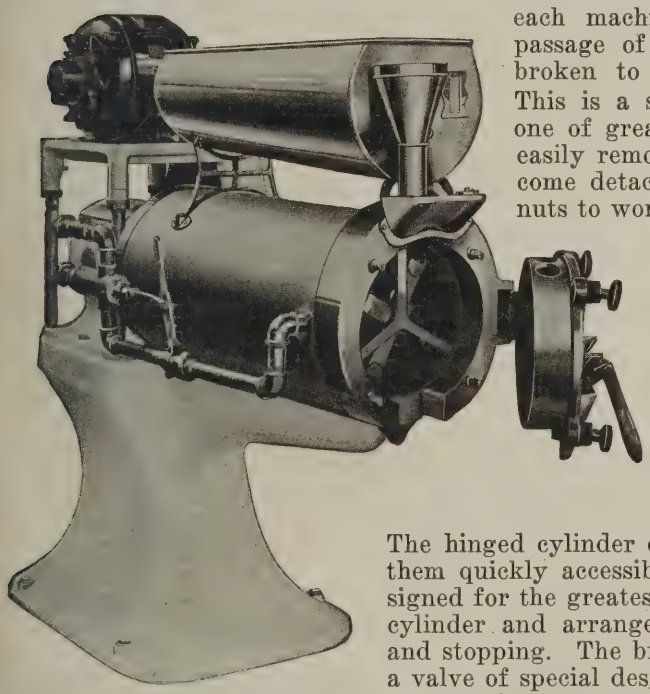
Standard Equipment for Ice Cream Plants



Immediate Shipment from Chicago or St. Paul

Creasey Ice Breaker

Every manufacturer of ice cream, large or small, needs this sturdy machine. Built over-size throughout—stands up under hardest service you can give it.

The size of the broken ice can be regulated by the use of fine or coarse combs—furnished with each machine—which prevent passage of the ice until it is broken to a certain fineness. This is a special feature, and one of great value. Picks are easily removed from drum when necessary, but they cannot become detached when in operation. No rivet heads or bolts or nuts to work loose.

More than 16,000 Creasey Breakers in use; why not put one to work in YOUR plant?

U. S. Brine Freezer

A large capacity freezer, heavily built throughout, with ample bearings and large gears. Furnished for either belt or motor drive, or can be converted from one to the other in your own factory when desired. Electric machine equipped with 3 H. P. motor.

The hinged cylinder cover is standard on all sizes of U. S. Freezers; makes them quickly accessible for cleaning. The brine jacket passages are designed for the greatest efficiency in cooling the cylinder and arranged to avoid all clogging and stopping. The brine flow is controlled by a valve of special design which gives complete control of the rapidity of the freezing process.

U. S. Freezers are made in 40, 60, 80, 100, 120, and 160 quart capacities; there is a size that will exactly meet your needs.

A handsome and practical machine that will pay for itself repeatedly in your plant. Let us give you further details and prices.

Have You This Catalog?

It is one of the most complete catalogs of ice cream machinery and supplies ever published. You will find between its covers the best of the things made by many of America's leading manufacturers —a valuable book for reference. We'll gladly send you copy on request —without obligation.

SCHROEDER LUMBER COMPANY GIVES ASSOCIATION PRAISE.

The Schroeder Lumber Company will be represented at the Wisconsin convention of Ice Cream Manufacturers in January and will be glad to greet old friends and to make new ones. The worthy regard which the Schroeder Company holds for the association is best portrayed in the letter printed below:

Milwaukee, Wis., Jan. 3, 1922.

Olsen Publishing Co.:

We have been identified with the Ice Cream Manufacturers of this state ever since the organization of the Wisconsin association. The phenomenal growth of this association is indeed praise worthy, easily accounted for when we recognize the spirit of the men who have helped make it a success. We are proud to be identified in this movement and would not allow anything to interfere with our attending the convention.

JOHN SCHROEDER LUMBER CO.,
B. F. Springer, Secretary.

* * *

A FEW WORDS FROM THE SECRETARY.

Chicago, Ill., Jan. 4, 1922.

The third annual meeting of the Wisconsin Badger Flyers will be held in connection with the Wisconsin Ice Cream Manufacturers at the Plankinton Hotel, Milwaukee, January 17 and 18, 1922.

An entertainment committee consisting of Badger Flyers and ice cream manufacturers residing in Milwaukee, is busy making plans for the entertainment. The present plans are to provide a special entertainment for the visiting ladies.

Be sure and see the secretary at Room 205 and 207 on the Mezzanine floor and pay your membership on the first day of the meeting, as we must have the money to pay for the entertainment during the evening of the first meeting day.

A business session of the Badger Flyers will be held in the Ladies' Club Room, immediately after the close of the forenoon meeting of the ice cream manufacturers on January 17th.

Another meeting will be held on January 18th in the Ladies' Club Room, following the forenoon session of the ice cream manufacturers.

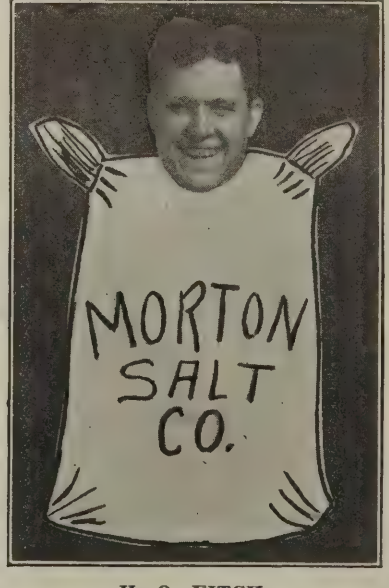
BADGER FLYERS,
O. E. Harwood, Sec.-Treas.

* * *

W. S. Sheley, the well-known representative for S. Gumpert & Co., of Brooklyn, N. Y., who has been traveling out of the Chicago, Ill., territory, has changed his residence now to St. Paul, Minn., and is covering the Minnesota, Wisconsin and the North and South Dakota territory. He is a loyal Badger Flyer and will greet all his old friends at the Wisconsin Convention in January. Mr. Sheley belongs to several ice cream associations and is well known in the middle west states.

* * *

THROWING A NEW LIGHT ON ICE CREAM.



Kindly accept my thanks for the return of the photograph—but honestly and truly you could have consigned it to your waste-paper basket as it was not worth the two-cent stamp you paid for its return.

You ask me to relate a little story that may be of interest to some member of the state ice cream fraternity during the coming convention—well, here it is:

Several years back while I was shouting the merits of Wyandotte from the housetops, I had occasion to make a drive from Wausau to Merrill—it was a dark and stormy night and the roads were in very bad shape—and as a consequence so were myself and flivver. In some unaccountable manner I got off the main drag and

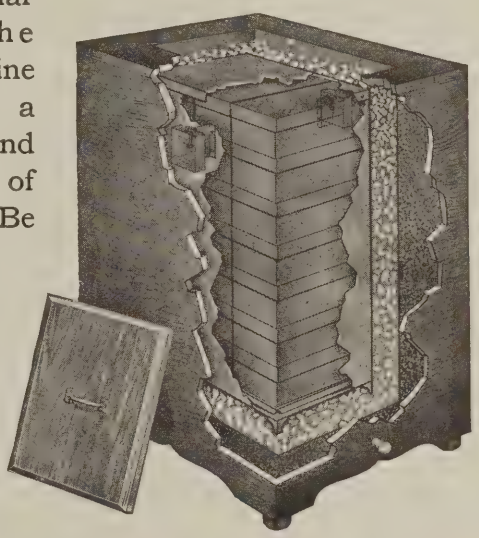
Nelson (Patented) Ice Cream Cabinets



"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

Three Compartment Cabinet

C. Nelson Brick Cabinet
Patented May 8, 1906

42 Qt. Brick Cabinet with Ice Rail

Patented Nov. 11, 1919—1321120

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Plan on your season's requirements now, and have your supply on hand when needed.

C. Nelson Manufacturing Co.

2308 Division St. **St. Louis, Mo.**

before I realized it I was lost completely. No friendly passer-by came along to enlighten me so I followed the time worn direction—went as far as the first cheese factory—then turned to my right as far as the schoolhouse —then to the left as far as the red brick church—but all in vain—to save my life I could not get back to the main road nor could I see the lights of any familiar town. Suddenly while I was pausing at a cross-road debating which way to turn next—a flash of lightning revealed a sign of some description on the fence post. I immediately turned my spotlight on same, thinking that I would be rewarded by some information that would send me on my way rejoicing—but much to my chagrin all the information the sign imparted was "EAT CARVER'S ICE CREAM." If Howard Carver's ears ever burned I'll bet they did at that particular moment—as what I said (to myself) was a plenty. It is needless to say that Carver, his ice cream and his darned old tin sign were consigned to regions where the ice cream business is nil.

Here's hoping that the coming convention will be one grand success and that all Badger Flyers will be there with bells on and that the entertainment they will provide will be a humdinger.

E. PEN. OWEN.

CAUSES HIM TROUBLE.

The following is an exact copy of a letter received by the Kellogg Ice Cream Co., of Burlington, Wis., recently and is just one example of how popular their week-end special ice cream is:

"Burltown, Wese.

Mister Kellogue:

Deer Frient: i got your cart by the male man alrite, and why for got sake don't you told me where to find this Choclate—Amond Weak-End. i near lost my hied from my wife. You don treet me rite, is my money not so good as the otter faller. I waist too hour with your dealer he look for Chocolate—Amond he holler and swear like hail and no find in hees bocks and say soon he all sold out. i cum hum my wife shee raise hail say my face smell like moonshine and i bain so long shee near kilt me. if you dealer all sold out weak end why don't you tell him buy more or my wife take tim to bake pie. good bye, your fran.

(Name Withheld).

THE BIGGER THE INCREASE THE BIGGER THE BONUS.

By C. W. Esmond, a "Servant to the Dairy Industry."

An ice cream manufacturer in a certain territory is stimulating his salesmen with an effective selling plan for 1922. His annual gallonage is less than 100,000. He has no regular salesmen calling on the trade but he is interested in another business that has seven men covering his territory. These men solicit ice cream business for him.

C. W. ESMOND

To stimulate real interest for 1922, however, he is putting up an attractive bonus for increase in sales in each territory. For instance, Bill Jones covers Redwood, Burns and Macomb counties. Sales of ice cream in these counties last year amounted to 15,000 gallons. If Bill Jones pushes the sales up to 20,000 gallons in this territory he will get a bonus of two per cent of the sales, in addition to his regular salary. He will get one per cent if he increases above 15,000 but fails to reach 20,000. If he increases above 20,000 he will get 2 per cent on the sales up to 25,000, and if he puts it up to 25,000 or over he will get 3 per cent. These are not the exact figures but they illustrate the plan which applies in a general way to each man. The quotas, however, will be different in each case, depending on the sales in those districts last year.

I notice that ice cream manufacturers who have tried some such bonus or commission plan for stimulating their salesmen feel that it pays in a big way.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS

The Sealright Process is Correct

TYPE "B" FOOT POWER

A Type Best Suited for Your Plant

Sealright Ice Cream Filling Machines are furnished in three types—Type "A", Motor Drive; Type "B", Foot Power; Type "C", Hand Power. "A" and "B" come mounted on heavy, strong, vitrified enameled cast iron base. "C" has flat base with provisions for securely bolting on table or work bench. We will gladly advise which type will be most practical and profitable for you to use.

The principle of the Sealright process is to displace the air from the package and fill by vacuum—no pressure, spill or push is used, and therefore no loss of yield.

Sealright Filling Machines

Simple–Rapid–Economical–Efficient

Just a year ago, the first machine was installed in Howe's Ice Cream Plant, Rutland, Vt. Unadvertised, and with practically no direct sales solicitations by us, demands for this machine became so insistent that within a few months we were compelled to make installations in seventeen states. Those who visited our booths at the National Dairy Show and Ice Cream Supply Men's Eastern and Southern Exhibitions know how quickly ice cream men recognized the superior merits of our machine. Certainly, no machine has gone over in so big a way and with such an amazing rapidity as the Sealright Filling Machine. "The operating principle is correct. It is the simplest, most easily operated, the most durable machine on the floor," say men who have made comparisons.

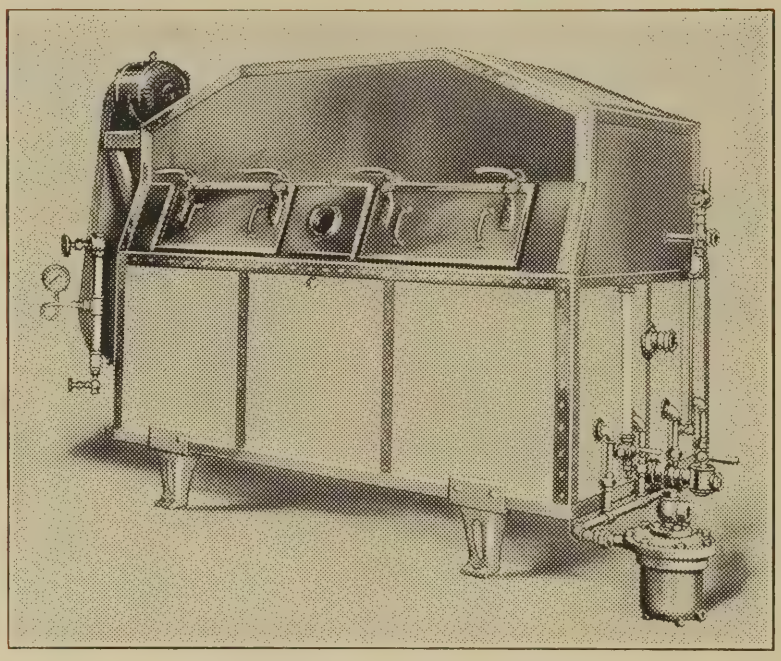
Break away from the cumbersome, costly, involved "brick system." Put out your good bulk cream in package form—efficiently, economically and satisfactorily—direct from the freezers. Use Sealright Filling Machines and Packages and earn larger profits.

Sealright Cylindrical Package For Bulk Ice Cream

Filled with One, Two or Three Flavors and in a Variety of Fancy Centers

Manufacturers, in large numbers, have discovered that this cylindrical package is the best one for keeping cream in fine condition. Being air-tight, the flavor does not freeze out in Sealright Liquid-Tight Cylindrical Paper Containers. It was from this discovery that demands resulted for a machine that would quickly, economically and satisfactorily fill these Sealright Containers.

Act Quick



Place your order early for Sealright Filling Machines. From present indications we know our capacity to manufacture these machines will be taxed to the limit in the early spring months. Place your order now so we can have machine ready when you want it.

The Cream Production Company,
Port Huron, Mich.

Gentlemen:

Having used one of your Condensers for sometime, we are so well pleased with its merits and the product that it produces that we gladly recommend same to all that might be desirous of turning their skim and surplus milk into money.

At this time of the year we are using our whole milk and butter, and by condensing it slightly we get the finest mix, and the best ice cream ever produced.

We find that by using your Condenser that we are saving the money, you claimed we would.

Yours very truly,

Stroudsburg Creamery Co.

Oklahoma Association of Ice Cream Manufacturers

Proceedings of Annual Convention held in Oklahoma City, December 12, 13, 14, 1921

The seventh annual convention of the Oklahoma Association of Ice Cream Manufacturers, was called to order by President J. B. Porter, of Tulsa, Okla., at 2:30 P. M., Monday, December 12th, 1921, at Lee-Huckins hotel. Registration showed twenty-nine active members, eight visitors, and wolf hounds present.

Mayor Walton was unable to be present and Judge J. S. Estes, of Oklahoma City, delivered the address of welcome. He mentioned the fact that Tulsa was the oil city of the state, and that other cities of the state excelled in their particular line of industry, but stated that Oklahoma City had become the convention city as well as the wholesale center of the state, and in behalf of Mayor Walton he welcomed the Oklahoma Association of Ice Cream Manufacturers to Oklahoma City and that he was turning the city over to us. He also gave instructions as to how the police might be influenced should the members desire lenient treatment from the department for violation of the jay walking laws.

Response was made by Mr. D. F. Solliday, of Oklahoma City, who thanked Mr. Estes for the welcome given the association and assured him that all members would comply with the jay walking laws but would not answer further for the members.

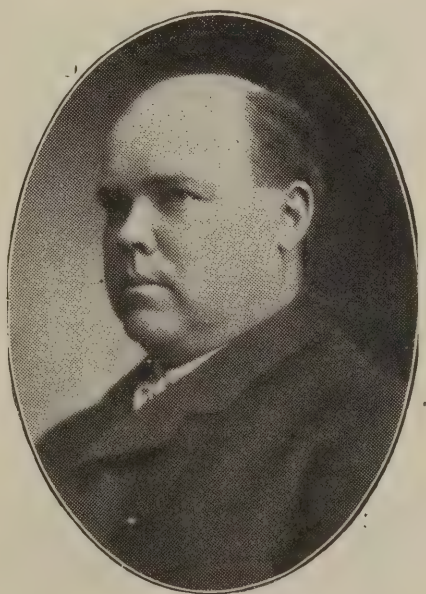
President's Address.

Members, Wolf Hounds and Visitors:

This is the seventh annual convention of the Oklahoma Association of Ice Cream Manufacturers and it is indeed gratifying to see the continued increase in attendance. While we may never hope to have things just as we might like to have them still these meetings with their acquaintanceship and good times evidently prove profitable or we would not continue to come back.

As I see it, the president's address should be a summing up of the experiences of the past year, together with suggestions for discussion as how best to avoid the mistakes made and to profit by conditions for the coming season. It should be confined to a survey within the association territory.

The season of 1921 started with bright prospects as to prices, supplies, and enthusiasm, but ere long we had lost both prices and enthusiasm and low cost of supplies only saved many manufacturers from bankruptcy.



Weather conditions were backward and especially so in June, while the Fourth of July is usually referred to as a frost. However, the latter part of the season proved unusually long, hot and uniform and consequently profitable where good business tactics were enforced. Estimates for an average over the state would show about 75 per cent of the previous year's gallonage.

Various trade abuses were allowed to creep in in some parts of the territory and will prove a serious handicap unless discontinued. Realizing we are still in the reconstruction period and the cost of supplies are not yet established we should be on guard to recognize the menace of unfair practices. The standard for this season has been the highest ever and shows the results of the earnest effort and conscientious work of Prof. Baer and assistants. Under the present rating of ice cream as essential the public are being rapidly educated to its real value and more and more insist on standard quality, and the successful manufacturers must comply with the demand for best possible product.

Methods of manufacturing, delivering and selling have undergone great changes in a short time. Since the government has recognized the value of ice cream and furnished scientific information as to proper methods of handling and proportions of ingredients improvement in quality is noticeable everywhere. Owing to the high express rate, together with unsatisfactory service, much of the distribution of ice cream is now made by truck service, which offers many advantages to both shipper and dealer, and bids fair to replace express shipments entirely on short hauls. In regard to selling methods it would seem we have not improved so much as in manufacturing and too much effort and too many concessions are made the dealer and not enough effort made to exploit the goods to the con-

sumers. While many firms have spent liberal appropriations for advertising the results have not justified the expense, however, we must all admit that advertising does pay and I hope this subject will be given thorough discussion at the proper time.

Trade revival is well under way and brings with it probably more new conditions than in any other line, conditions which to be met successfully will require better methods in our business. It was my good fortune to hear Prof. McCullom address the ice cream manufacturers at national convention at Minneapolis in which he plainly stated their policies and methods were not to his liking and could not have his encouragement until improved. Good business is coming and its profits will go to the men and organizations who have recognized the change and increased the effectiveness of their methods. In finance and accounting customary practice of long time credits and loose methods must give way to prompt collections and quick knowledge of accounts. In organization the staff must be trained to work as a unit instead of picking up the force from the first men applying for a job. In production, such matters as purchasing, inventory control, cost finding, personnel management, quality and price must be under control to assure the success of your business and in marketing the field must be more intensively cultivated than ever before.

I want to extend a word of welcome to the supply men and assure them we appreciate their help and support and welcome their attendance at all regular sessions of the convention and I also want to urge our members to get better acquainted with our visitors from neighboring states as well as their fellow members.

Our secretary has endeavored to arrange a program which would prove instructive and interesting to every one interested in the ice cream business and so far as may be to confine it to plain, practical subjects of everyday business. This is your convention and we hope every member will express his views freely so that we may all gain new ideas.

The Wolf Hounds have arranged for entertainment for practically all time not devoted to convention matters and judging from the clean-cut program of the last convention am sure it will be enjoyed and appreciated by all.

President then appointed the following committees:

Nominating Committee—E. N. Ward, Chairman; H. B. Greer, E. L. Lindsay.

Resolution Committee—D. F. Solliday, Chairman; S. P. Lay, A. H. Klump.

Some Things to Consider When Selecting

TUB HANDLES

No. B–85
Patent Applied For

To Jobbers and Equipment Manufacturers

Our facilities for manufacturing metal products are practically unlimited. Metal stampings are a specialty with us and our long experience in this line makes it possible for us to offer an economical service to users of metal parts. Write us on your requirements.

A sharp bump on a cast iron handle, and the handle is cracked—off.

And a tub without a handle is like a ship without a rudder—it becomes awkward to handle, the possibilities of spilling are magnified, losses of ice are frequent and even the dumping of the cream itself results from a handle giving way at the critical moment of lifting packers from delivery trucks.

Hence the necessity of selecting a tub handle that will stand all sorts of abuse and be sure to provide a handy and positive grip for the delivery man.

Beehler Tub Handles

Are made from special steel of a toughness that defies destruction

They are light in weight, easy to put on, and once thoroughly fastened they outlive the tub, they are designed to facilitate handling.

Demand Beehler Tub Handles for your tubs. If your dealer can't supply them, write direct to us,

Beehler Steel Products Co.

Manufacturers of Complete Metal Parts

St. Louis, Mo.

Report of secretary-treasurer read and approved.

President appointed Mr. S. P. Lay, H. B. Greer and E. N. Ward as the auditing committee.

Mr. Lay, chairman of the executive committee, advised that he did not have his report in order and asked for more time.

Mr. Carl Glitsch, chairman of the legislative committee, advised that he did not have anything of interest to report.

Report of Express Committee—J. A. Oxley, chairman. Mr. Oxley not being present Mr. Lay advised that his report would be covered by the report of the executive committee.

As your delegate to the national convention I would like to bring you a report in which you might find something profitable.

The attendance was considered very good as the first session opened with about 300 members and associate members reporting.

An excellent program was outlined and carried out in full and as it would require too much time to report more than the high spots or subjects the detail can be read at your leisure in the trade journals. The most value of such convention is the information, enthusiasm and comparisons to be learned outside the convention sessions.

Following the opening exercises and reports of officers the president, Mr. Martin, made an address in which he referred to the rapid development of methods in manufacture, and to the comparatively small depreciation and light depression in the ice cream business as we dealt in perishables and had light stocks to carry. He thinks ice cream should be our national dish even as wine is the national drink of France. Attention was called to the exorbitant freight and express rates and claim made they are exceedingly detrimental to the ice cream business. He stressed sanitation as our watchward and as we cater especially to children our product should be right. He also urged that the fight against the use of substitutes be continued even more vigorously. A paper by Mr. Sine, who seems to have been quite successful in building winter sales of ice cream laid part of the blame for slow sales in winter, on the dealer, who is disposed to get grouchy when frost comes. His motto is, "Better Service, Richer Product, Advertise." This paper started discussion on brick ice cream which was again taken up next day. This discussion brought out more ideas and more information as to brick ice cream than ever before. It was admitted by practically all manufacturers that the trade and even their own families preferred bulk rather than brick ice cream, but few had ever stopped to think or inquire why. After discussion, however, they all agreed the public appreciated the difference in weight or contents without knowing the reason.

Another discussion which would be of very great interest to manufacturers at certain times was in regard to sandy ice cream. This trouble has been thoroughly threshed out and information to solve the problem can now be obtained from several sources.

An organization report was submitted as to formation of the American Research Institute, to be operated jointly by the National Association of Ice Cream Manufacturers and the International Milk Dealers' Association. Three objects are set forth,—Complete organization of a library of all dairy books and publications of the world.

Institution of commercial ice cream and milk plant for research work.

Establishment of fundamental research work on matters relating to public health.

While these matters seem a long way from the practical work of our commercial plants it is easily shown why they are needed and the benefits derived, for instance, in case of an epidemic and suspicion laid at door of an ice cream factory it is now hardly possible to escape damage even though innocent while a finding from such an authority, if innocent, would protect from civil damages, at least. When you stop long enough to realize the enormous volume of business in connection with the dairy industry of which the ice cream business represents only 4 per cent the need of such an institution is apparent. The U. S. department of agriculture market reporter under date of June, 1921, gives the total whole milk used in ice cream in 1920, 3,575,000,000 pounds, and total quantity of ice cream produced in 1920, 260,000,000 gallons.

The display of equipment was very complete and several machines showing latest ideas in freezing, packaging, wrapping, and delivering were shown. The most striking thing in the way of a freezer was an arrange-

Concentration

THIS month we approach our thirty-fourth anniversary. Back in 1888, The Hudson Manufacturing Company was established. Our business—Vanilla Products for the ice cream industry. In those days we knew all of our customers by "first name." Some of these we still call by first name; others have "gone beyond the great divide." Many of our present customers were mere babes and "kids" then, while some had not as yet come into this busy world. From a small beginning, nearly a generation ago, we have watched the ice cream industry grow. We grew with it. Always devoting our time, our efforts, our thoughts, our purpose to that of furnishing the industry high-grade Vanilla Products all the time. Naturally, when you speak of Hudson's Famous Ice Cream Flavor and Tonka Blend No. 52 Special, "old timers" will signify their approval and frankly sound its praises—for the name Hudson has always been synonymous to quality vanilla. We concentrated on producing quality goods, never wavering to the temptation of cutting the quality to make the product "cheaper." This policy earned us a reputation we shall not endanger at any time. Thru 1922, Hudson must signify, as in the past —Quality, Service, Fair Price.

Ice Cream Manufacturers, Supply Men, Poodle Dogs Will Attend Convention

We always look forward to conventions with a great deal of pleasure because we have always benefited by them and always enjoyed ourselves, too. But if there's one convention we have a little softer spot in our hearts for, it's the Iowa Association of Ice Cream Manufacturers' convention. And do you know why? Haven't you got a sneakin' idea that it's because that famous association of POODLE DOGS is also an Iowa product and that they are always on deck and making things hum? All you ice cream manufacturers and supply men who have previously attended these Iowa conventions, we know, will be there again without any urging; but those of you who have been lax in attending affairs of this sort are the ones we are after. Come away from your home town and visit Cedar Rapids on January 24-25 and get a lot of good ideas and start life right for the New Year. Let the Iowa convention solve your problems for you and give you some crackerjack suggestions that will help you be successful in business. And above all, get acquainted with that live bunch of POODLE DOGS—they will show you the time of your life for the two days of the convention. You won't regret the coming—make it a little vacation—you ice cream manufacturers won't get time for a vacation next summer, you will all be busy taking in the money which we hope 1922 will give you an opportunity to make.

Cedar Rapids is a fine little city of about 45,500 inhabitants; as one man said, "They have 44,496 inhabitants and 4 ice cream manufacturers" there. You will find plenty of amusement and you will like the Montrose Hotel, too. You will vote it one of the finest hotels for courtesy and hospitality that you have ever visited. They are preparing to entertain you—come and help make this convention one of record attendance.

Cedar Rapids is located in the center of a circle and is one night's journey from six great cities of the middle west, and it's the city where the women folks only have to wear their blankets as far as Chicago or Kansas City to find the halls of fashion and the marts of trade, so watch your wife at the station for she may decide to take a through train to one of these two cities instead of pausing at Cedar Rapids for the convention—and we need the ladies—for they always help make the conventions pleasant and enjoyable. But come to Cedar Rapids, fellows—even if you have to walk to get there—but there is no need of that mode of conveyance for you can reach the city by railroad or on highways galore and in any vehicle except a submarine.

Cedar Rapids has five of the largest diversified industries in the world and their trade territory embraces one hundred ten million hungry people. They feed the world with Quaker Oats, Sinclair Hams, Fidelity Bacon, Douglas Starch and Corn Oil and they expect after this convention to put Iowa's ice cream on the map forever. They say the sun never sets on an Iowa egg; they lay more eggs per yard than any place in the world outside of Shanghai, China, but the Shanghai rooster does not labor under the handicap of the Iowa Housing Law, which forbids chickens above the first story. Iowa eggs alone out-value the entire orange crop of the United States, and don't forget Iowa's butter; didn't they win the banner at the National Creamery Buttermakers' convention? Ask Minnesota. But nobody loves a statistician nor cares what he does with his decimals, so just let us add that we want you to come to the convention and see for yourselves just how much of a benefit it will be to your industry and just how much you will enjoy the visit.

These Iowa Poodle Dogs and Iowa Ice Cream Manufacturers are accused of owning more automobiles than bathtubs; but who needs as many bathtubs as he has automobiles? So when you come to Cedar Rapids let the ice cream manufacturer in his Packard and the Poodle Dog in his Ford, show you around, but don't all run for the Fords at once. They will drive you around a twenty-mile boulevard which encircles the town and links up a series of the most beautiful river and woodland parks in America. View the landscaped residential districts which total a thousand acres, exquisitely wooded, with every lot a park. The Cedar River bisects

The Colonial Ice Cream Co. Have Ordered More
U. S. Heavy Duty Freezers

The Colonial Ice Cream is one of the most progressive in their line. They finally decided in favor of U. S. Heavy Duty Giant Freezers to replace smaller units of another make only after making thorough tests of one of these modern up-to-the-minute Giant Freezers. They had installed one of these especially for that purpose on trial, to see what it would do under actual working conditions.

They found that a 160-Quart U. S. Heavy Duty Giant Freezer will turn out as many, and sometimes more 160 quart batches per hour, than other makes of machines of less than half the capacity, yet the Giants required no more attention or time on the part of the operators to keep them going continually, than did the smaller machines.

As a result of these tests, they ordered two more, and later another three. The above illustration shows the plant with six machines in place. Recently they have ordered still another three so there will shortly be nine altogether.

By trading in their smaller machines for U. S. Heavy Duty Giants, this Company have doubled their production capacity without hiring more help or requiring more floor space.

The Reason Why

If you want to know the reason why, and incidentally get the latest information about new developments in ice cream freezers, WRITE AT ONCE FOR OUR NEW CATALOGUE, just off the press.

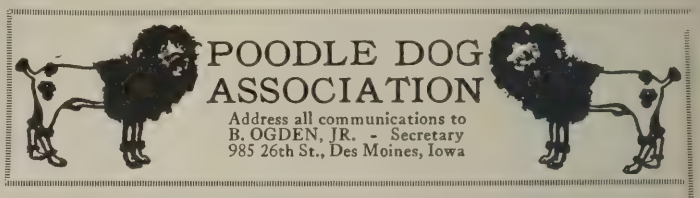
the city and has transformed a magnificent island into a civic center. Of course, if the weather is cold, the Packard man is the one to cultivate the acquaintance of.

They say Cedar Rapids has never had a panic—but there will be one when all the ice cream manufacturers and supply men alight from trains on the morning of January 24th to see the savage splendors and the modern Babylon of the Iowa ice cream convention enacted in the little mid-western city which usually is satisfied with even, untemperamental life which flows like the song of a violin peppered by an occasional cashing symphony. But now Cedar Rapids is preparing to show you the super-achievements of the ice cream industry—so come prepared with your memorandum to jot down all the new, helpful and interesting facts with which to combat your problems in business.



Cedar Rapids is a democratic city; it's a town where little, old ladies are helped off the street cars; and is as kind to the rich as well as to the poor; it is human, with Christian vices and pagan virtues; and they say there are a few citizens who even favor the ex-president's fiftieth point, light wines and beer. (We hope the Poodle Dogs don't see this last line; we don't want to scare them away from the convention).

You supply men, who are not members of the Poodle Dogs' Association, will be before you leave that convention; and you manufacturers of ice cream who are not members of the state association—beware—they'll get you. You all think you know what P. D. Q. stands for, but you don't—it stands for joining the POODLE DOGS QUICK instead. When you meet all those live, good looking men who belong to the Poodle Dogs, you will want to join P. D. Q.

We have tried to describe Cedar Rapids as it is—picturesque, progressive and prosperous, healthful, hospitable and human; a city whose name is a poem; and an association of Iowa Poodle Dogs who strive in the words of Mark Twain, so to live that even the undertakers will be sorry when they die (and that's going some!)

History has recorded the Poodle Dog Association of Iowa as the first organization of ice cream supply men to adopt THE ICE CREAM REVIEW as their official organ—and now the POODLE DOGS have grown to be some "Hounds"—the story of the origin of their name can be found elsewhere in this edition. They are waiting to greet you one and all at the coming convention.

DON'T FORGET THE DATE—January 24-25—DON'T FORGET THE PLACE—Cedar Rapids, Ia.—AND DON'T FORGET THE GIRL—Bring the wife along.

How the Poodle Dogs Came to Life.

St. Louis, Mo.

The Ice Cream Review:

The Poodle Dogs of Iowa owe a great deal to The Ice Cream Review and as president of this organization wish to thank you for courtesies extended in your splendid magazine in our behalf.

I am sure the January issue will be a wonder and will look forward to a copy with great pleasure.

It recalls to my mind the small crowd of supply men who had gathered at Waterloo, Iowa, in the fall of 1911, to attend the annual state meeting of the ice cream manufacturers. After the business session had adjourned we visited the various exhibits at the dairy show grounds where the meeting also was held. In our rambles around the grounds we chanced upon a booth operating a wheel of fortune which sold paddles containing several numbers. The wheel was turned and the lucky number was called, awarding a prize to the holder.

Like boys at a county fair with the gambling instinct, we took many chances and one of us (I cannot recall who it was) drew a stuffed Poodle Dog. Not to be outdone by this lucky fellow we continued to buy paddles until each one was supplied with a Poodle. We then went down to the Ellis hotel, decided to call a good-fellowship meeting to become better acquainted; the result was the birth of the Iowa Poodle Dogs, by unanimous vote, with a membership of about twelve

Economy of Space

The full utilization of plant space is a subject which is demanding greater consideration than ever before. Increased capacity and lower proportionate operative costs are the usual motives for erecting a new plant.

With a certain area of ground space, a certain volume of business to handle, and a limited amount of money to put into it, owners quite naturally want and expect every square foot of space to contribute towards maximum efficiency of the new or remodeled plant.

Every foot of unnecessary and useless space adds to the initial cost as well as to the daily operative expense.

Economy of space, therefore, is a most important problem, to which prospective builders should give their closest attention.

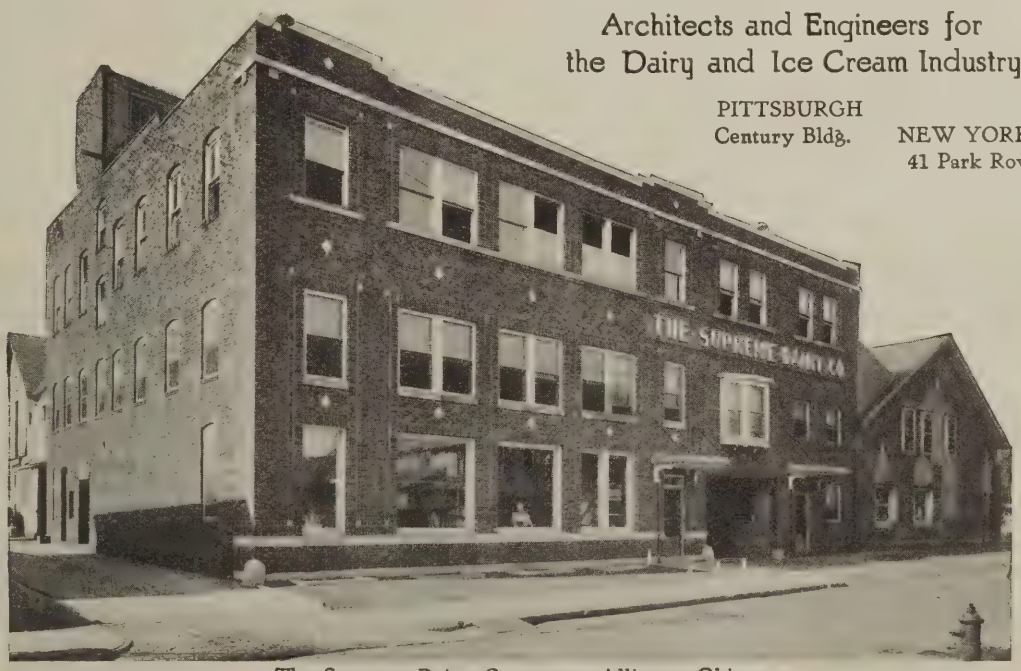
Prospective Builders may obtain full information relative to the application of McCORMICK SERVICE without obligation. Isn't it worth investigating?

Conspicuous among numerous other notable features of

McCORMICK

Architectural and Engineering

SERVICE



plants is the economic utilization of space. Areas and cubic contents are designed in scientific ratios by our experienced Engineers after an exhaustive study of machinery placements, steam, water and sewage lines, light, ventilation and the movement of labor. All these factors, which have a vital bearing on the economical uses of space, are elementary considerations executed in advance of the preliminary plans first submitted to our clients.

* * *

Ernest W. Wupper, with the Downey-Turnquist Co., Chicago, Ill., sent us his photo on the "off change" that he might still be able to use it. We did, and we are glad he sent it because he is leaving Milwaukee, the home town of The Ice Cream Review, and is now locating in Minneapolis, Minn., and we shall always have his photo, at least, to remember him by. We liked Minneapolis, too, when we went to the Dairy Show, but still we think Milwaukee is some town at that; but, when opportunity knocks, we suppose we ought not to mourn too much over the losing of our resident friends, so we wish him God speed and much success in the new location. Mr. Wupper was kind enough to take the trouble to hunt for his photo among household goods, which were still in the process of being moved—and we appreciate what a job that was; and say, you Poodle Dogs, don't you think E. W. looks just the same as he did some years ago? Downey-Turnquist ice cream and essential oil flavors seem to agree with him. Look him up at the Iowa state convention and give us a report.

* * *

"Danny" Webster, the Minneapolis and St. Paul salesman for the Elyria Enameled Products Company, Elyria, Ohio, promised us that he would "scramble around somewhere in the attic and see if we can find a photograph suitable to grace the pages of your next issue of The Ice Cream Review. We certainly trust that in case you insert same, it will not injure your circulation to any great extent," he writes. D. M. evidently went to the attic alone and has not been discovered yet, for we have not received his picture. But we've a good picture of him in our mind, fresh from the National Dairy Show, for didn't we visit with him a wee bit each day and didn't we enjoy it? Well, I guess. If you find his picture in this issue folks you'll know friend wife found him entangled in a pile of old shoes, and that the picture is the "survival of the fittest" among the Poodle Dogs. If he lives to tell the tale, we'll expect to see him at the Iowa convention.

* * *

Look around for Fred Hollweg's picture. Maybe you'll find it. Isn't he natural? We often wonder how he can look so well after all these conventions, and the evening parties we meet him at, for he takes them in and so do we (when the boss lets us go). F. E. beat us to a few conventions and one of them was the Seattle Show, which we were sorry to "escape" going to but the Rocky Mountains sent this little echo back to us and whispered that Fred Hollweg was the originator of this little joke:

Son: "Father, is ice cream technically a butter or a cheese?"

Father: "Cheese it my son, that's a very daring (dairying) question."

Not so rotton, eh? All this brilliancy comes from being associated with the Thos. W. Dunn Gelatine Co., we suppose. But, wait; maybe it's because he's a Poodle Dog—golly, we never thought of that. We'll find out for sure at Cedar Rapids, at the Iowa convention.

* * *

We almost played a little joke on A. W. Zimmer, Jr., traveling salesman for the Solar-Sturgis Mfg. Co., Chicago, Ill., with the aid of "Dad" Zimmer. A. W., Sr., sent on the photo of "Sonny" Zimmer during the latter's absence, (was working his way home for a good "square" on Christmas day, from the South) and we were going to surprise him by presenting him with his noble countenance all pictured out in the January number of The Ice Cream Review, when the cat got out of the bag and Junior sent a telegram not to publish said (what we really thought was a noble) picture. We cancelled the order for the cut upon his promise to send us another one. Father Zimmer says that "these boys just at that age mature rather fast and they think they

From left to right: De Laval Cream Separator, De Laval Milk Clarifier and De Laval Emulsor in the Missouri Valley Creamery Company's plant, Washington, Mo.

"The De Laval Emulsor has considerably improved the quality of our ice cream"

—states the Missouri Valley Creamery Company. "It makes us entirely independent of the sweet cream supply, which feature alone is worth the price. We would not care to be without it."

Some ice cream makers are using the De Laval Emulsor merely to improve the quality of their product. It does this by giving the entire batch a most thorough mixing and aeration.

Others are using it to lower manufacturing costs and assure an ample supply of cream at all times. The De Laval does this, too, by enabling them to buy butter and skim milk powder when they are cheap and storing them for future use. These stored products are, from day to day, made up into real cream of any desired butter-fat content which whips and swells the same as the best "raw" cream.

Write today for the De Laval Emulsor Catalog and the book "What Users Say of the De Laval Emulsor."

The De Laval Separator Company

Sooner or later you will use a De Laval

change more than they have." Take a look for yourself.

G. L. Matteson, who represents the Creamery Package Company, of Chicago, Ill., out of the Waterloo, Ia., territory, sent us a fine picture of his family, and incidentally we didn't find him on the picture until the last one for we were busy scanning the lovely countenances of a perfectly fine family. But we finally discovered him due to the fact that he wrote, "You will recognize me as the fat one with the round wind shields and shiny dome sitting at the head of the procession." We found him from his accurate description and we had no trouble. Sorry we couldn't publish the picture of the whole family, but we really wanted a few of you to notice "father." Mr. Matteson says he makes no claim to personal beauty beyond the ordinary, like most Poodle Dogs who depend upon their sales for a living, and he sent us his latest and only photo. All kidding aside, Poodlers, he's a good lookin' fella at that. What say? Say it at the Iowa Ice Cream Manufacturers' Convention in January.

* * *

Jos. X. Gubbins, well-known "Knight of the Grip," who was formerly associated with Fred K. Higbie in the Kansas Rock Salt Company, has for the past six months been affiliated with the Paterson Parchment Paper Co., of Passaic, New Jersey. His territory is out of Chicago. This Mr. Gubbins is coming to the Wisconsin Ice Cream Manufacturers' Convention, January 17-18, and we are looking forward to meeting him with much eagerness. We like his name—somehow or other, Gubbins was always connected with a round, jolly plum pudding in our minds, and that X in his name—well X always did stand for mystery, and we like 'em solved. We will find him when he comes. Then we'll already be acquainted for the Iowa ice cream convention.

* * *

There is one woman left in the world who still cares enough about her husband to want to retain his "best" and only picture. When we asked the President of the Poodle Dogs of Iowa for his physiog for the January issue of The Ice Cream Review, he came back and said, "I am forwarding my best photo, in fact the only one I have. Mrs. Bulger was rather reluctant to let it go, but I assured her it would be returned in perfect condition." So we took precious care of that picture and returned it intact, although there was one young lady here in our office who wanted to keep it after she saw it. We leave it to the Poodle Dogs if the women aren't always telling us that "good men are few and far between now-a-days" —well—we don't blame Mrs. B. for appreciating a good thing and from the reports we get of this "hound" president and his "kennel," fur will fly pretty lively at the livest convention of the season when the Iowa convention comes off on Jan. 24-25, at Cedar Rapids. Mr. Bulger says he thinks the December issue of The Review was surely a dandy, and he also says he is proud to be included in the January number. "We want the Poodle Dogs 'to the front' at all times and leave it to The Review to keep them there," he writes. We'll be there with the bark any time we can help these Poodles along.

* * *

The J. G. Cherry Company, of Cedar Rapids, Ia., has quite a number of Poodle Dogs among their list of able salesmen. We expect they will all be in attendance at the Iowa Convention in January, on the 24th and 25th. R. S. Damuth, L. L. Flickinger, C. W. Hutchinson, W. S. Hamilton and A. Granzow are all Poodlers. They plan to make things hum at the live wire convention which the Iowa State Ice Cream Manufacturers are famed for. So many Cherry men, each with a hand in the convention doings, are bound to make a success of a gathering, and they promise those attending a royal time.

W. M. Booth, who for fifteen years has represented the Crescent Manufacturing Company of Seattle, Wash., in Iowa, Minnesota, North and South Dakota, part of Wisconsin and part of Michigan, will be in Cedar Rapids at the Iowa State Convention of Ice Cream Manufacturers with bells on. If he is as liberal with the jug as he was with his last photo, none of the Poodle Dogs, of which he is a member, will go thirsty, we mean hungry—'scuse us; for when we asked for W. M.'s picture he wrote back that he had 'sent us the only picture he had of himself, and if we could use same we were welcome to it.' We could use it and to good advantage, and we did. Booth and the rest of the Poodlers will show everybody attending the Iowa convention in January a yelping good time. They want to meet you all there.

Another well-known famous Iowa Poodle Dog will be at the Iowa State Convention in Cedar Rapids when the boom of the first big gun announces that the convention is off. Jas. A. Steiger, representative of Kenne-

The Flavor Sells Your Ice-Cream

Here are 4 Types of Vanilla Flavoring that will sell your product

GIANT VANILLA COMPOUND
is all that the name implies.

MAMMOTH VANILLA COMPOUND
Different to Giant but equally strong.

VANILLA AND TONKA
Moderately priced. Hundreds of ice-cream makers swear by it.

STRAIGHT VANILLA BEAN EXTRACTS
Mexican, Bourbon, All Bean and Suva.
Contain 1 lb. of beans in a gallon of extract.

Inquire about our contract prices.

—o□o—

RED SEAL COLORS
Prices for 1922 are materially reduced. Our pure certified colors excell in strength and brilliancy.
Powder, Liquid or Paste.

—o□o—

RED SEAL RIPENER
Helps age the mix. Improves your ice-cream.

WARNER-JENKINSON CO.
ST. LOUIS

dy & Parsons, Omaha, Nebr., is his name. He may be named after a piano but he makes a better "Poodle." Everybody in the territory knows Jim and he will be greeting many friends at the convention.

* * *

A. J. Edholm, representative out of the Mid-West sales office of the Pfaudler Company of Rochester, N. Y., is another live Poodle Dog Ky-ute who will be in captivity at Cedar Rapids on the 24th and 25th of January, at the Iowa Ice Cream Manufacturers' Convention. When he sent us his photo, it was hooked up with another, but he says his was the one with the "X" over the picture and we hope we didn't look cross-eyed and get the wrong one in the Rogues' Gallery—but there's one consolation to an uncertainty of this sort and that is if A. J. doesn't like the way the picture "took" he can always say it is the other fellow. Mr. Edholm's territory is Minnesota, Iowa, Nebraska and the Dakotas, and he manages to keep the firm well represented and muchly on the map. A lot of us will be glad to meet him in Iowa, but we warn him, some of us have got an awful hearty handshake, and we ask him to remember that the "copper" isn't the only one who can pinch."

* * *

H. J. Ryner of the Perry Packing Company of Perry, Ia., has two titles and we are trying to find out which of the two he is the proudest to own. He is an official POODLE DOG and an E. P. E.—don't rack your brains trying to figure out what the E. P. E. is for you never can guess, although the stuff is fast becoming as famous as Monte Carlo—it stands for Esquimo Pie Eater. We publish for your perusal a letter received from Mr. Ryner—look over the list and find your name among those who attended a good, live convention a few years back.

* * *

Perry, Iowa.

The Olsen Publishing Co.:

Quite accidentally I ran across a clipping from our local paper, dated Jan. 24, 1918, which brought back quite vividly to my mind my first Ice Cream Manufacturers' Convention, which was held that year, I believe, at the old Savery hotel, Des Moines. I arrived at the hall just as the bunch were telling the world in stentorian and not altogether unmusical terms that "That man Corliss was style **all the while.**" The occasion of that particular outburst, as I learned later, being Mr. Corliss' invitation extended to the convention to a trolley ride of 35 miles to Perry and return.

That is how it came about that the last session of the 1918 convention was held in Perry, in the dining room of the Pattee hotel, an honor which brought out all the city officials and business men as a glad hand committee to welcome the distinguished guests and their Poodles.

The following is a list of those present as it appeared in the local paper. You will recognize 90 per cent of the names, and I earnestly hope they will all be in Cedar Rapids for the big 1922 meet, January 24th and 25th. Should any hesitate, just tip them off that they are now making Eskimo Pie at Cedar Rapids.

F. E. Fowler, J. H. Beers, Mrs. J. H. Beers, Mrs. W. F. Rick, Mary Lewis Chambers, Will A. Schwindeler, Mrs. W. A. Schwindeler, Geo. F. Robinson, Ben Ogden, Jr., J. H. Lessenhop, E. J. Grundy, Paul Beer, H. J. Hayes, George T. Irvin, Sam Middleton, R. I. Crowell, A. Fleutsch, A. D. Rippert, W. S. Wilcox, James Allan, W. S. Day, Lee Blue, Jim Nelson, H. M. Tyler, Ed. Spinna, C. J. "Quality rather than price"

DO you know of any permanent business success established on the theory—"Sacrifice quality to meet a price which will attract sales?" Would you jeopardize your business with such a practice? True enough, there are extenuating circumstances—times when the temptation is exceedingly trying. But, really, how can any of us hope to fortify our business reputation by disregarding quality? It takes faith, we'll admit, and courage, to hold fast to "the trust imposed." Still, are not the leading business houses more highly regarded by you—those whom you know maintain quality "as represented?" Just how much faith do you honestly put in a product offered at a "cheap price" so you will buy? Let's continue to adhere to quality standard for the year 1922. We will all profit most.

The Boerner-Fry Company

Manufacturers of High Grade Extracts

Iowa City, Iowa

Washing of Ice Cream Cans Revolutionized

Hand washing of ice cream cans has never been satisfactory. It has been unsanitary, slow—costly.

The R & A Ice Cream Can Washer offers the solution of the problem – revolutionizes the washing of ice cream cans.

6-10 Cans Per Minute

It washes six cans per minute minimum speed and ten cans per minute maximum speed. Handles all size cans from 2 to 5 gallons. Covers and brick moulds are washed with the cans.

Hand washing of ice cream cans has never been satisfactory. It has been unsanitary — slow — costly.

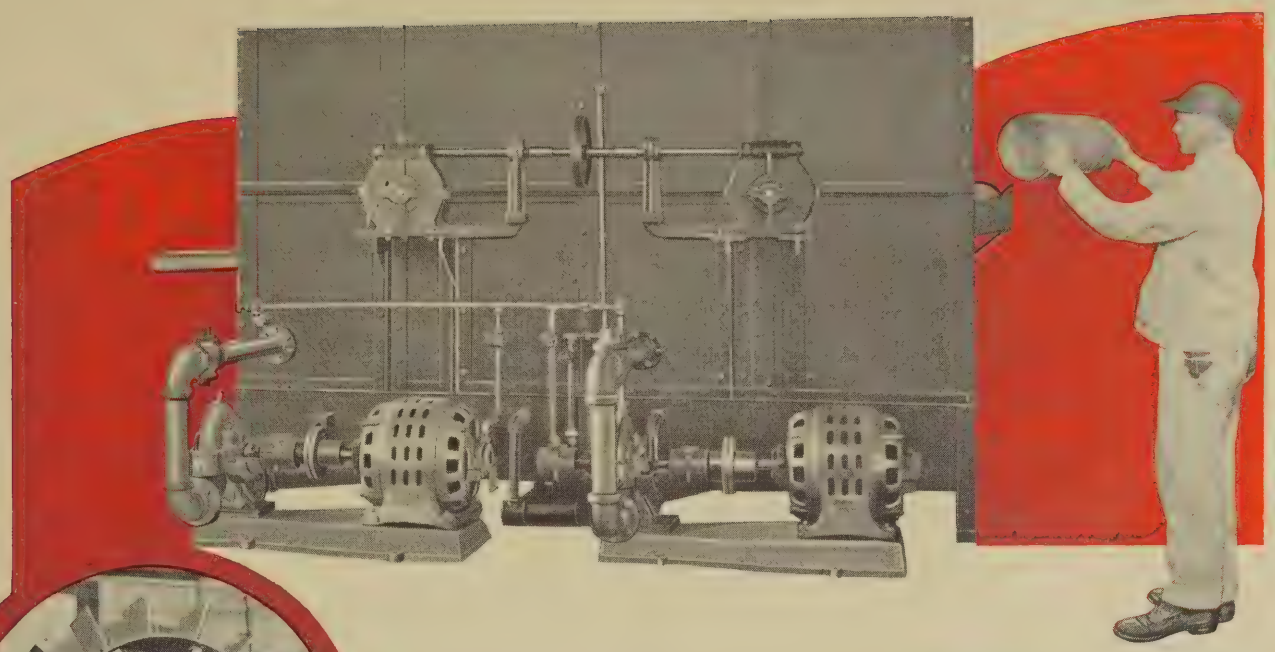
Washes, Rinses, Sterilizes

The washer is a two compartment power driven machine. In the first compartment the cans receive 5 washings of solution water at 140 degrees and in the second compartment 5 rinsings at 190 degrees, followed by one sterilizing from jets of fresh boiling-hot water.

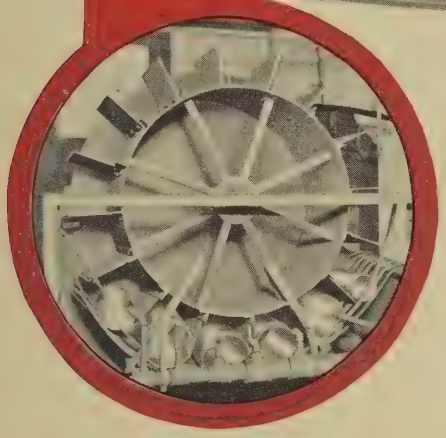
The cans are carried through the machine in the pockets of star wheels. No overhead shafting is required.

Clean, "Sweet," Sterile Cans

Cans washed by this machine are clean, sweet and sterile—far superior to cans washed by hand.

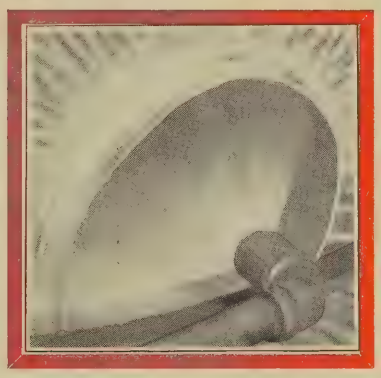


By producing cleaner cans this machine helps the manufacturer to produce a better and a more wholesome product.



The machine will save enough in labor to pay for itself.

RICE & ADAMS CORPORATION
166-182 Chandler St. Buffalo, New York



Branch Sales Offices:
150 Nassau St., New York, N. Y.
104 So. Michigan Ave., Chicago, Ill.
52 High St., Malden, Boston, Mass.

Rice & Adams Ice Cream

The machine is of the "star wheel" type which provides for washing the cans as they lay on their sides and prevents water from collecting in the bottom of the can. There is one "star wheel" in each compartment. The cans roll thru the machine, so that the jets strike all parts of the can.

The wash and rinse water is under 40 to 50 pounds pressure and is directed to every part of the can, inside and outside, by specially designed fan shaped jets placed at various angles.

Specifications

Pumps. Highly efficient, split shell type.

Tank. 3/16" tank plate, welded and galvanized after.

Hood. 1/8" tank plate, welded and galvanized after.

Screening. Heavy gauge galvanized.

Equipment. Pressure gauges, noiseless water heaters, steam and water supply pipes, overflow and drain pipe, temperature regulator for last tank, drain table with sloping top for draining the clean cans, dial thermometers, loose steam exhaust fan, etc.

Galvanizing. The tanks are made of 3/16" steel with welded seams dipped in hot galvanizing after they are made up. This seals the joints, prevents rough edges and makes the tanks rustproof.

Labor Required. The minimum speed requires one attendant who can both feed and unload the can. The maximum speed requires two attendants.

Mojonnier Ice Cream Packaging Machine in Use in Plant of Carroll Co., Chicago

Patented December 17, 1918. (Process and Other Patents Pending.)

The Mojonnier Ice Cream Packaging Machine is of the positive force feed type. It discharges an exact measured quantity of each flavor into each carton, which when hardened exactly fills that carton—no more, no less.

It fills your standard cartons, lined with parchment liner or without liner or practically any other type of carton, including the round containers and ice cream pails and small individuals, either 1/10 quart, ⅛ quart, 1/6 quart, ½ pints, pints, fifths or quarts.
Fills individuals in one, two or three flavors.

Sold on either a liberal rental basis or outright sale.—Write for descriptive circular.

Does not decrease overrun.

Automatic measured feed type.

Floor space 40x96 inches.

Two Models

Model A, capacity 1200 quarts per hour, $2,250.00

Model B, capacity 900 quarts per hour, $1,750.00

Neil D. Sutton, who represents the Corrizo Extract Company of New York, called at the office personally with his photo and said, "God help you if you don't take good care of that." So we told him the story of the young divorced couple and of their words at parting—the husband said to the wife, "God bless you if you stay away, and God help you if you come back." So we decided that we might have to go back with that photo and we took dinged good care of it. Say, but that man is a fooler on age—we thought him at least 15 years younger than he really is—he's got it all over the women—in not showing his age. He'll be at the Iowa convention and we would like to have all you good friends meet him.

DOWNEY'S HAT IN THE RING.

The Ice Cream Review:

Chicago, Illinois.

We are going to lend our very best efforts to making the Iowa, Wisconsin and Michigan ice cream association meetings bigger and better than ever. In addition to myself, our Mr. Tucker and Mr. Wupper will be in attendance this year.

We are not only pioneers in these movements, but are and have been great believers in co-operation. We have seen in the last twenty years the smallest ice cream manufacturer grow to the very biggest, and we take a certain amount of pardonable pride in the great progress the ice cream industry has made.

It is true that we have not been able to give very much assistance to the associations the past three years, but we are coming back with both feet and full of optimism for the new year and season.

Business conditions are no doblt looking up. Labor is becoming settled and the general lowering of prices on raw material of all kinds which enters into the manufacture and delivery of good ice cream is bound to result in that volume that every maker needs, which makes the profit.

Our new price lists for 1922 are now in the press and will carry a general reduction in price on many items without lowering or reducing our established qualities.

DOWNEY-TURNQUIST & CO.

Per C. E. Downey, President.

BURDANS TO ADVERTISE HEALTH AND FOOD VALUE OF THEIR ICE CREAM.

Burdan Bros., Lebanon, Pa., are going to advertise the health and food value of their ice cream all the year around.

Burdan Brothers first started making ice cream twenty-two years ago in Pottstown, Pa. Today Burdan Bros. have four big establishments at Wilmington, Pottstown, Lebanon and Reading, and each plant running most of the time to capacity.

In Burdan Bros. plant, health precautions are carried to extremes. This establishment is equipped with the latest mechanical apparatus. The equipment is constantly scrubbed, oiled, sterilized and kept in immaculate condition.

Mr. C. C. Burdan said: "Up to the present time ice cream has been considered a treat, or confection, for the summer time alone. If little Johnnine was a good boy he might have a dish of ice cream. Johnnie should have his ice cream regularly every day, winter and summer.

"It would make him grow. My own two boys, for instance, big six-footers, owe their health and strength to ice cream. They would eat it all the time.

"Aunt Jemima pancakes used to be made only in winter for no earthly reason. Now a lot of people eat Aunt Jemima pancakes the year around because there is every reason why they should.

"So it goes. People can eat ice cream in winter now —in their warm, cozy homes—and thrive on it."

TWO ARE NEARLY FROZEN TO DEATH IN REFRIGERATOR.

Stevens Point, Wis.—Locked in the refrigerator of a local ice cream factory for more than two hours, with the temperature eight degrees below zero, Julian Falkavage and H. J. Daniels escaped from freezing to death recently when the former forced his way through a window little more than eight inches square.

The door slammed shut and locked when the pair were inside the refrigerator placing some produce in cold storage. Efforts to reopen the door were futile.

Wearing light clothing, they soon became thoroughly chilled and finally decided on the plan which brought about their rescue.

TEXAS ICE CREAM MEET.

The fourteenth annual convention of the Texas Ice Cream Manufacturers' Association held in Fort Worth, Texas, on December 7-8-9, was well attended and proved a success in every way. The Texas men always have a good convention and their last one was no exception.

A meeting of the executive committee and the board of directors was held the first day. Prior to the convening of the convention in the afternoon. Following the report of the secretary-treasurer, H. F. Owsley, Dallas, H. T. Pangburn, substituting for Frank W. Wester, president, who was unable to attend because of illness at the afternoon meeting which formally opened the convention, delivered the president's address.

A. J. Mays spoke on "Express Claims, Proper Manner of Filing and How to Prevent," in the absence of J. A. Crosswaite of the American Railway Express Company of Fort Worth, who was scheduled to make an address.

High labor costs and freight rates, coupled with other elements have prevented a reduction in price of ice cream, Harry A. Benners, Del Cambre, La., said in speaking on "Salt and the Reason for Present High Price." A. J. White of San Antonio spoke on "Cost of Re-Icing and Its Effect Upon Ice Cream Consumption." Mr. Owsley, the secretary, read a paper on "The Common Interest of Competitors," which was scheduled to be read by William A. Cocke of San Antonio, but the paper was written by him and forwarded to the secretary, as he was unable to attend.

S. S. Lard of Fort Worth was on the program for the second day's meeting for an address on "Proper Depreciation on Ice Cream Packers, Cans and Trucks."

One of the principal addresses was by E. H. Golaz, chemist in charge of the food and drug bureau, state board of health.

Professor J. W. Ridgeway, also spoke on "The Value of Increased Milk Production to the Ice Cream Manufacturer."

A complete report of the proceedings will be published in a later issue of The Ice Cream Review.

Election of officers resulted in the following:

Prsident—J. J. Sullivan, Houston, Texas.

Vice-President—N. C. Matthewson, Marshall, Texas.

Secretary-Treasurer—A. J. White, San Antonio, Texas.

A board of directors was elected consisting of W. A. Cox, San Antonio; A. Rant, El Paso; S. B. Bonner, Temple; M. Thomas, Beaumont; S. S. Lard, Fort Worth; J. D. Carruthers, Wichita Falls; M. W. Wortman, Waco; J. J. Juscan, Sherman; and George L. Boyd, Sherman.

The 1922 convention will be held in San Antonio.

JACK RABBITS

Kansas City Missouri

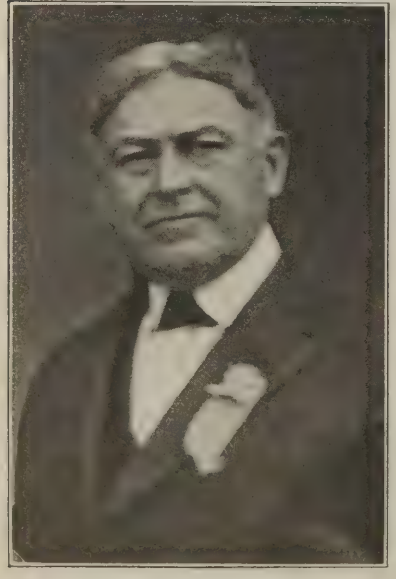
HOW TO GET TO THE KANSAS MEETING.

The Ice Cream Review:

Lest you forget, this is to remind you that the Kansas convention, which was postponed last month, will be held at the Baltimore Hotel, Kansas City, Mo., January 26th and 27th.

Am reminding you of this early so there will be no excuse for non-attendance. We want all Jack Rabbits present. Am informed that health conditions in Kansas City are now in first class shape and there need be no fear on this account.

Furthermore, if you attend the Iowa Convention in Cedar Rapids on the 24th and 25th inst., you can get over to Kansas City in time for the Kansas meeting on the 26th. Am arranging with the Rock Island to give special service so that there will be no slip-up. You can leave Cedar Rapids 7:00 P. M. on the 25th and arrive in Kansas City next morning at 7:20. The railroad will place a Pullman car at our disposal in Cedar Rapids and have a representative there to look after tickets, berths, etc., but they will require twenty-five (25) tickets for the special car, so if you are going to attend Iowa and go to Kansas City, wish you would advise me.



Invite everybody along the line to the Kansas meeting. Manufacturers from other states will be welcome. Will be disappointed if I do not meet you in Kansas City on the dates scheduled.

Wishing you a prosperous year in 1922,

Yours very truly,

J. L. NELSON,

President, Kansas Jack Rabbits.

W. S. RECTOR,

The WEIBATCH
It Weighs

THE desire of the up-to-date ice cream manufacturers for some simple method of accurately weighing the mix into the freezer has resulted in the development and perfection of the WEIBATCH. This batch control is now on the market and is in successful operation. The WEIBATCH is a Batch control which will automatically weigh, record, and deliver to the freezer a definite number of pounds of mix.

It is simple in construction, positive in action, accurate in results, and neat in appearance.

Its simplicity of consrtuction make it a fool-proof machine, while its accuracy gives a check on the handling of ice cream mix that has heretofore been impossible.

Every ice cream manufacturer knows that the specific gravity of mix is constantly changing, and that any **measuring** device, no matter how accurate it may be in **volume,** is very misleading when checking back against the mixing room or the freezer room.

If you are contemplating installing additional freezers, or have a desire to eliminate waste, save time, put out a uniform frozen product, by all means ask for our circular, "What the WEIBATCH will do for you."

WILLIAM G. FINCH CO., Inc.
45 Division Avenue, S.
GRAND RAPIDS MICHIGAN

Big Show and Convention At Saginaw

The big show and convention at Saginaw, Mich., Feb. 14-15-16-17, under the auspices of the dairymen's associations organized under the name of the Michigan Allied Dairy Association, is going to be one of the biggest events of the year in the dairy industry. During the course of the show there will be lectures on all subjects of dairy production and the manufacturing of all kinds of dairy products and a fine display of dairy, farm and dairy manufacturers' equipment. A butter scoring contest will also be held.

With but one or two exceptions, this show has always had a record attendance and the association is looking forward to a record-smashing crowd for the 1922 show. Great preparations have been made for the handling and entertaining of the crowds and it is estimated that every booth will be filled. It had been decided that for last year's show, the supply houses would simply send representatives and not set up an elaborate display of machinery such as had been done in other years. But the scheme was not as forceful or successful as anticipated and this year's plans are for a full exhibition of the latest and best dairy equipment that is to be had. The Auditorium where the exhibit is to be held, is large and spacious and will accommodate to fine advantage the very fine display which will be arranged.

The following affiliated organizations make up the Allied Association: Co-operative Association of Creameries, Exhibitors' Federation of the Michigan Dairymen's Association, Michigan Association of Ice Cream Manufacturers, Michigan Association of Creamery Owners and Managers, Michigan Buttermakers' Association, Michigan Guernsey Cattle Club, Michigan Holstein-Friesian Associaiton, Michigan Jersey Cattle Club, Michigan Milk Dealers' Association, Michigan Milk and Dairy Inspectors' Association, Michigan Milk Producers' Association and the Michigan Poultry, Butter & Egg Association. As Saginaw is situated in the center of a well developed dairy section, it would seem that all these associations mentioned would provide a good field for a record attendance of visitors interested in any line of dairying from A to Z.

The management will make this convention unique and attractive for a large crowd. Saginaw affords every opportunity for a good convention—it draws from the whole state. An excellent program will be furnished—prizes will be offered in various ways. The meetings will be held in the exhibit building in separate rooms; this will make it convenient for those attending and will also hold the visitors at the convention building.

The famous MICHIGAN DAIRY BOOSTERS will be there stronger than the "Light Brigade" and you can depend upon a royal welcome and a fine time—no need to dwell upon the reputation of these fellows for entertaining—no one ever left a convention where this organization held sway and was disappointed. There are lots of surprises in store for those attending this year and we urge all to be on deck when the show opens on February 14th and stick to the finish, for IT'S GOING TO BE SOME SHOW.

Look this issue over carefully and see the fine showing of boosters for the Michigan convention—you will find that all your old friends will be there—these boys have come forward and helped THE ICE CREAM REVIEW to boost for this convention's success—when there is loyalty, pep and spirit such as the co-operation these fellows have given us, behind a show it is bound to be a howling success. Predictions are that 1922 will be the turning point in business conditions from stagnation to one of bountiful returns—the best way to reap YOUR SHARE of success for this year is first of all by attending the convention and reaping the benefits which a show of this sort is bound to teach. Many important problems—problems which come up in your line of business frequently and which you are not sure just how to combat—will be discussed and you will carry home many helpful ideas. Men who are experts representing every phase of dairy industry that produces, manufactures and distributes products which contribute to the welfare of practically every man, woman and child in the United States, will be in attendance. It is important that you realize the necessity of attending the convention and the meetings of the different associations—for knowledge broadens one and your business is bound to profit by it. This show

Billy Bell Says— "You Can't Test Them All"

If your desire to be a "good fellow" carried you to a point where you agreed to test the vanilla of every salesman who called, you wouldn't get much of anything else done.

And your ice cream customers would soon raise a roar because no two batches tasted alike.

Then, What's a Poor Fellow to Do?

Just this: Make **one batch** with

TISCO "545"

Taste it; satisfy yourself that it is better than any other vanilla you ever used at any price.

Then get everybody about the plant to taste it without telling anybody what vanilla you used. You'll see their faces light up with surprise and delight.

Be sure, also, to keep track of the customers you supply from that batch; don't tell **them** about any change in flavor; but watch and see how many of them **increase their next order.**

What Is "545"?

It is absolutely the best Ice Cream Vanilla ever produced by anybody.

Yes, best at **any price;** because it is exactly the **right** combination of pure vanilla bean (38%) and artificial flavors such as vanillin, coumarin, essential oils and fruit flavors (62%).

Better than **all vanilla,** because the pure bean extract is 50% alcohol, and so volatile that it loses flavor after the cream stands.

Much better than all artificial, because you have to have the **true** vanilla to give that delicious, palatable flavor which is looked for in high grade Ice Cream.

It's Best, because we put the stuff in the barrel! It's there, brother; and after you once use "545" you'll fight before you allow **anybody** to even **suggest** any other vanilla at **any** price—high or low.

Think of it—2 qts. of "545" will flavor 100 gallons of dairy mix or from 190 to 220 gallons of finished ice cream. We will send a 2 qt. test sample for $1.90. The barrel price is $3.80 per gallon.

THE TISCO COMPANY

Southwest Office—208 E. Myrtle St., San Antonio, Texas.

places before men of the dairy industry an opportunity to gain knowledge of untold value; and in view of this, let every person who can possibly attend, arrange to be on deck at the best convention ever held by the Allied Associations of Michigan. Let the show, coming as it does before the beginning of the spring season's rush, be a vacation trip along with the more serious thoughts of benefitting by attending. If every manufacturer in the dairy industry would put into operation in his business the many great things that are given him by attending these conventions, our great industry would be still greater than it is. This year, above all others, it is highly necessary for all men in the dairy industry to know how to handle the situations which must be met in these times of reconstruction. This convention will be just the place to discuss the corners and angles which are constantly coming up so that we may be better able to master the difficulties in our business.

LET US ALL PUT OUR SHOULDER TO THE WHEEL and help make this convention a success and a record-smasher. The people you will want to meet will be there—the old friends you will want to greet will be there—take advantage of this opportunity placed before you. ALL ABOARD FOR SAGINAW IN FEBRUARY.

* * *

Convention Notes.

Oh, golly, today when word came into the office that A. J. Miller, of the Sanitary Tinning Company, Cleveland, O., was going to the Michigan Dairy Show at Saginaw on February 14-15-16-17, we sure did acquire an awful longing to go too. Know why? Well, "Millauw," has got the funniest laugh and its so catching that you have perpetual giggles all the time you are with him—he's a sonofagun all right and the way he can tell funny stories would make you want to travel way to Saginaw just to listen to him. You know the old saying, "Smile and the World Smiles With You; Weep and You Weep Alone?" Well, when you are with Achilles you do both, for first you grin and then you smile and then you laugh and then you roar until you weep anyhow—but not from sorrow, just from a pain in the "sugar plum" territory. He'll be at the Saginaw show, so if you haven't met "Axel" and his wares, just step right up and get acquainted.

C. J. Yunkers is the best little (?) booster we have got on our list. Say we wanted photos of a few of you famous Michigan Dairy Boosters and we appealed to C. J., the famous billiard player, and he sent us a whole suitcase full of fellows' pictures with a national reputation. (Wait! We didn't say what for), and they are all Dairy Boosters from Michigan. If we can't get up a worthy booster column for the Saginaw show with that material and beautiful scenery, we give up. That little "ole" Rex Extract man is going to be the busiest man at the show, busy seeing that everyone has a good time and that everybody is comfortable, and we only hope he doesn't meet Miller until the last day of the show, because we once saw him laugh so hard at "Millauw's" jokes that he nearly fell out of his seat and lost his dignity. Fact is, we almost did the same thing. Come on over to Saginaw, those of you who already know Yunkers, and greet him—and those of you who don't know him, come on over and get acquainted with the CHAMPION MICHIGAN DAIRY BOOSTER of the United States. * * *

We certainly expect R. E. MacFarland of the Essex Gelatine Company of Boston, Mass., back from his western trip in time for the Saginaw show. Why, if "Mac" didn't show up who would wipe the cob-webs off the ceiling? (He's a little short fellow—this is for the benefit of those who have not yet had the pleasure of meeting him). At that, we wonder why he tarries so long out west—can it be that some brunette has at last vamped this bachelor six-footer? Gee, we hope not—somehow or other we feel he wouldn't be half as much fun if he were married—and besides maybe you say Mulholland and Black and a few of the rest of them wouldn't miss him. The latest reports tell us that Mac will be at the show, however, so we decided not to worry about the other trivial matters. Get acquainted with him all you fellows who don't know him, for you never can tell when your decorations may drop from the ceiling and you will want a stepladder—believe us, then's when Mac comes in handy.

* * *

J. F. Schlick, Jr., of the Kalamazoo Vegetable Parchment Company, Kalamazoo, Mich., is a staunch MICHIGAN DAIRY BOOSTER and he'll be at the show in January. He sent us his photo and then wrote to tell

Um-m-m Good—

It takes mighty good ice cream to please them, and good ice cream can be made only with materials of high quality.

Manufacturers of good cream realize the importance of quality in the gelatin they use.

Swift & Company possesses many advantages that permit it to offer good gelatin with good service; that is, gelatin of the highest quality, graded to your requirements, delivered to you when you want it, and at a reasonable price.

We invite your inquiries regarding our product and our prices.

Swift & Company
U. S. A.

us that he neglected to place any marks of identification upon same. He says, "The only way you can possibly determine who it is, is from the wrapper." Why, old boy, we didn't have any trouble at all—the "slick" lookin' face that peeked out at us when we unfolded the wrapper just spelled Schlick all over—don't worry, we won't give anyone else credit for that face—it belongs to but one man and he shall have it. When we looked at his photo, we thought of the kind words he wrote us, saying, "I want to say now that you are some boosters for the ice cream business and hope that your efforts to boost the ice cream and dairy business will not go unrewarded. I hope that all the ice cream people will appreciate what you are doing to uplift their business." Thanks for "them" kind words, brother, and we hope to meet you face to face to thank you at Saginaw in February.

* * *

Mr. A. T. Pratt, eastern representative for the Paterson Parchment Paper Company, ought to be a MICHIGAN DAIRY BOOSTER, don't you think so, fellows? We trust he will at least be at the Saginaw show so that we can induce him to become one of us. He is a trusting fellow—we know, too, for didn't he loan us his last photo in order that we might have a cut made from same? That proves it, doesn't it? He sent the photo on and wrote us, "I hasten to send you my LAST photo. As soon as you are through with it, please return same as it is my last and only one. Be as gentle with it as you can. Would awfully hate to try and have as good a one taken again." Funny how these guys despise the picture galleries, isn't it? Some of 'em, we wager, wouldn't be a movin' picture actor for anything. Come on over to the Michigan show, A. T., and bring your parchment paper along and get in swing with the rest of us fellows and help boost whether you're an M. D. B. or not.

* * *

All the fellows who are Michigan Dairy Boosters, and a lot who aren't but ought to be, will all be at the Saginaw show in February. Among those who are not, are R. J. Decy and A. A. Senor—look their pictures up in this issue of the Review and see if you don't think they ought to belong to that association. We wanted to favor the bunch by printing the picture of an old member of the Michigan association, Mr. Emery Thompson, of the Emery Thompson Machine and Supply Company, New York—but his picture seems to be as unobtainable as the presidency is for William Jennings Bryan. Mr. Decy informs us that Mr. Thompson is too modest to entertain any proposition along the lines of having his picture published, but that he kindly requested a substitute—and the "sub" was no other than our friend R. J. and of course we were glad to get it but we really did have room for both of them. Really no need of putting a fellow like Decy before the limelight because he is already as well known as Napoleon or Julius Caesar, so we put the well-known sales manager of the Emery Thompson Company in this issue just for decoration instead.

* * *

Be sure and look up the photo of that famous "Gelatine Peddlar," W. E. Stewart, who represents Swift & Company gelatine department, Chicago, Ill., out of the Grand Rapids, Mich., territory. Don't let him tell you it's an old picture, cause it isn't—it was just taken. Says he hasn't had his "picture taken" since Hector was a pup and that he had to have a new one taken—nice of him, wasn't it? W. E. is a Michigan Dairy Booster and he'll be at the Saginaw convention and we all look forward to meeting him then.

* * *

WM. G. FINCH RESIGNS.

Wm. G. Finch resigned his position with the A. H. Barber Creamery Supply Company of Chicago, Ill., on December 1st, 1921.

Mr. Finch is now affiliated with a new company known as Wm. G. Finch Co., Inc., 45 So. Division St., Grand Rapids, Mich. The new company will manufacture and sell the Weibach and Signid weighing devices.

The officers of the company are as follows: Wm. G. Finch, president; L. R. Finch, vice-president; John S. Townsend, vice-president; H. M. Walker, secretary and treasurer; W. H. Martineau, vice-president and general manager.

The new company will have a large exhibit at the Saginaw, Mich., convention.

* * *

FOR THE NEXT FEW WEEKS LET'S BOOST.

In regard to the Michigan convention, from all appearances it is to be a real winner this year. Every-

one in any way connected is putting forth every effort to make it a real success.

I have attended Michigan conventions for about 25 years, and for years we would speak of the convention as the "Big Michigan Show," as it was a real show, and a very close rival to the National show, with a very fitting program, very largely attended.

A few members, for a number of years, have been of the opinion a good meeting could be held without the machinery and supply exhibit; so when the freight conditions three years ago were so bad, it was suggested again and carried, with the result the interest was largely lost in the convention. At the last meeting it was voted unanimously to have, for the next convention, one of our old time dairy shows, and am very glad to say that every effort is now being made to make the 1922 convention the best ever held in Michigan.

Nearly all the available space in the large Auditorium at Saginaw is sold now and everything is going fine for the big show. Let's all get behind the men, behind the man, behind the show—and for the next few weeks, "BOOST!"

Verys very truly,
C. A. GROVE.

MICHIGAN DAIRY BOOSTERS NEWS.

By C. J. Yuncker.

R. E. MacFarland, representative for the Essex Gelatine Company, is expected to make a speech at the Michigan Dairy Boosters' smoker and he can do it for he knows how.

* * *

The editor's sidekick should attend the Michigan convention for there will be lots of snappy news to write up for the March issue of The Cream Review.

* * *

The Furnas Ice Cream Company, of Columbio, Ohio, has increased its stock to $100,000.

* * *

The Freeman Dairy Company, of Flint, Mich., is opening up a branch plant in Jackson, Mich., and will also manufacture ice cream.

* * *

Michigan Dairy Company, of Adrian, Mich., is a new firm incorporated for $100,000.

H. S. Adams Creamery Company, of Chillicothe, O., has incorporated for $15,000.

* * *

LaGrange Co-operative Creamery Co., of LaGrange, Ind., is a new firm and has incorporated for $50,000.

* * *

For the Saginaw convention, the floor space is practically all sold out and we are afraid some firms are going to be disappointed.

* * *

Vincennes Milk & Ice Cream Co., of Vincennes, Ind., has increased its capital stock to $250,000.

* * *

The Fort Wayne Dairy Co., Fort Wayne, Ind., has taken over the Bash Sanitary Milk Co., and J. M. King is the manager.

* * *

D. H. Gundrum, representative for the Keiner Williams Stamping Co., is expected to attend the Michigan convention at Saginaw in February and if he appears, he will be expected to help the dairy boosters entertain at the smoker with some of his dancing, as he is good at it and surely those who attend this smoker will enjoy it. So let's trust it to Dave and see him there.

* * *

The Beechwood Dairy Company, of Marion, Ind., is a new incorporation. They are capitalized for $10,000.

* * *

Foote Bros., of Hillsdale, Mich., who operate a bottling plant and ice cream company, report a nice business this season and are now painting up and getting ready for 1922, as they expect to increase their business.

* * *

Fred Hollweg, of the Thos. Dunn Co., while at the Buffalo convention, partially promised to attend the Saginaw convention. We hope he will do so for he will find the Michigan boys good and jolly, and a fine bunch, and Fred can sure be of help in entertaining them with his piano playing at the dairy boosters' smoker. We have already put him on the list of entertainers. Trust he will come.

* * *

The Michigan Dairy Boosters will give their smoker on Thursday night at the Saginaw convention, at 9 P.

"If Made from Canvas We Make It"

WEST SALEM OHIO

M., January 16th. Be sure to be there for you will enjoy it. Then is the time for all to get acquainted with each other.

* * *

Are you beginning to think about the Saginaw, Michigan, convention which will be held in the municipal auditorium on February 14-15-16-17? You should not miss it for the Michigan Allied Dairy Association is going to give you a fine convention. The manufacturers are going to give you good exhibits; the banquet will be fine, for that entertainment committee will see to it that everyone present is pleased; and the smoker will be full of pep and enjoyment, for there will be good music, plenty of cigars, and ice cream and cake. Remember! We are expecting you there—do your best and try not to miss it.

* * *

Now let's see how big an attendance the Michigan dairy convention can draw at Saginaw. Everybody get ready and be there in full force and then go home and feel happy that you came and be ready for the big business year of 1922.

* * *

The Findlay Dairy Co., of Findlay, O., will install new freezers for 1922.

* * *

The Heckler Co., of Napoleon, O., has sold its building and has purchased another site to build upon. They will begin to build immediately and when their new ice cream and bottling plant is completed, they will have a model building. They are doing a nice business and are hustlers.

* * *

The Defiance Ice Cream Co., of Defiance, O., has taken in another partner. On October 6th, 1921, they incorporated for $25,000. The officers are: W. C. Hopkins, president; L. W. Hopkins, vice-president; G. E. Watts, secretary and treasurer. Later on they will erect their own building. They report a fine business.

* * *

Albert Joseph, Upper Sandusky, O., will start to build a new brick two-story building for his ice cream plant and will make other improvements to his plant.

Joe Dumit, Upper Sandusky, O., has purchased and will install a York Manufacturing Company four-ton refrigerator plant. He just completed a new garage.

* * *

Elmer Otto, of Sandusky, O., is touring Europe.

* * *

The Ashland Sanitary Dairy Co., Ashland, O., has just completed a new two-story brick addition to the plant which is 50x75 feet in dimensions. They will enlarge their retail sales room and move the offices to the second floor of the original building. They are doing a nice business and later will make more extensive improvements, such as enlarging their storage room and adding more equipment.

* * *

E. S. McGinnis, formerly with Baker Ice Cream Company, of Cleveland, O., is now connected with the Sweet Clover Dairy Company of Wooster, Ohio.

* * *

The Seneca Dairy Co., of Fostoria, O., will reorganize.

* * *

Look this issue of The Ice Cream Review over carefully and see the photos of those who will attend the Saginaw convention. They are the real MICHIGAN DAIRY BOOSTERS and represent reliable firms.

* * *

Joe Dumit, Upper Eandusky, O., suffered a heavy fire in his fine residence.

* * *

The Sweet Clover Dairy Company, Wooster, Ohio, has completed its new addition to the building. It is two stories high and is 33x100 feet, with a retail room 32x21 feet, facing North Beaver street. The floors and the walls are of white tile, with a marble counter 25 feet long and under the counter is a 10-hole cabinet for ice cream, which is made of porcelain, the tops are of German silver. The cabinet is cooled from the refrigeration lines. The refrigerator in the retail room is of white tile inside and outside and has white enameled doors. It is 8 feet high, 12 feet wide, 2 feet deep and is also cooled from the refrigeration lines. They

EXPRESS TAX EXIT.

The public will save approximately $1,500,000 a month as a result of the elimination of the war tax on express shipments, according to George C. Taylor, president of the American Railway Express Company.

The "Revenue Act of 1921" eliminates the war tax of 1 cent on every 20 cents and fractions thereof in transportation charges on all express shipments. This tax during the year of 1920 amounted to $17,502,918. The average transportation charge for each express shipment was approximately $1.50 and the average war tax for each shipment was 8 cents.

The elimination of the tax, therefore, will virtually amount to a decrease in rates of a little over 5 per cent. Mr. Taylor believes that this should have a tendency to stimulate business and thereby accelerate the rapidly improving conditions throughout the entire country.

"The American Railway Express Company handles approximately one million shipments a day or nearly four hundred million shipments a year," Mr. Taylor goes on to say. "The elimination of the tax will relieve the American Railway Express Company of an immense amount of labor which has been involved in calculating, entering on way bills and collection of tax, not to mention the expense of checking and accounting entailed.

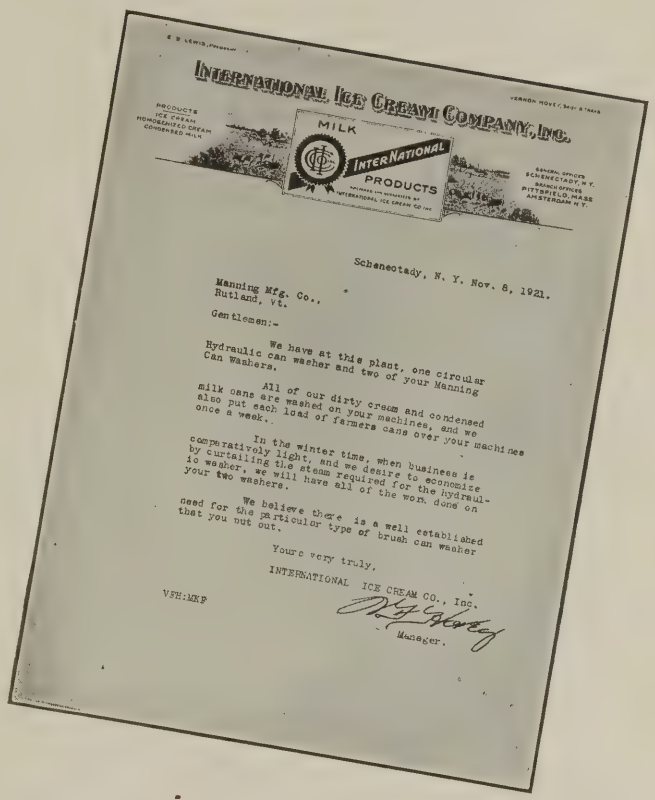
"The treasury department has requested express carriers to advise all claimants who have claims pending for overcharges or who file such claims after December 31st, 1921, that claim for refund of tax should be filed on treasury department form No. 46, with the commissioner of internal revenue, within four years from the time tax was paid, claim being barred by statute of limitations if received after such time."

Mr. Taylor points out that as the revenue act becomes effective January 1st, 1922, the tax on all shipments forwarded "prepaid" on or before December 31st, will be collected. On shipments forwarded "collect" and arriving on or after January 1st, the tax will not be assessed.—Educational Service Bureau, American Railway Express Co.

FROM BEER TO ICE CREAM.

Pittsburgh Brewing Co., Which Showed Deficit in 1921, Has Formed Tech Food Products Co.

Boston.—When the Eighteenth Amendment was added to the Constitution and the Volstead Act created for its enforcement, a great deal of real estate and machinery was doomed to idleness and the scrap heap except in instances where new lines of business were undertaken. In such a plight was the Pittsburgh Brewing Co.



For the year ending October 31 the company suffered a loss of $667,164 following a $595,317 deficit in the preceding fiscal period.

The company now turns from beer to ice cream. It has formed the Tech Food Products Co., which has leased two Pittsburgh Brewing Co.'s plants, one to manufacture ice cream in volume and the other to be a cold storage plant.

In the seven months in which the new concern has been operating its sales of ice cream and revenue from cold storage, operation amounted to $807,000, on which here was a net profit of $96,800 after operating expenses and depreciation.—Wall Street Journal.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review.

"A Well Established Need"

INTERNATIONAL ICE CREAM COMPANY, INC.

MILK — INTERNATIONAL PRODUCTS

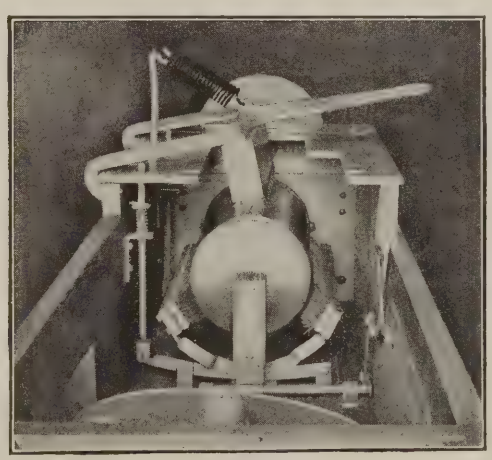
Schenectady, N. Y. Nov. 8, 1921.

Manning Mfg. Co.,
Rutland, Vt.

Gentlemen:-

We have at this plant, one circular Hydraulic can washer and two of your Manning Can Washers.

All of our dirty cream and condensed milk cans are washed on your machines, and we also put each load of farmers cans over your machines once a week.



In the winter time, when business is comparatively light, and we desire to economize by curtailing the steam required for the hydraulic washer, we will have all of the work done on your two washers.

We believe there is a well established need for the particular type of brush can washer that you put out.

Yours very truly,
INTERNATIONAL ICE CREAM CO., Inc.
VSH:MKP
Manager.

We want you to know how Manning users like the Manning Can Washer. The above letter is a fair sample. Next month we will publish a letter from a prominent Wisconsin ice cream man. Look for this advertisement—and others to come!

Pacific Slope Dairy Products Show

Wonderful Exhibition Held at Stockton California, December, 5-10, 1921

By F. B. FULMER

The first annual meeting of the Pacific Slope Dairy Products Show was held in Stockton, Calif., on Dec. 5th to 11th inclusive. The show was held in the State Armory under the auspices of the California Dairy Council and was the first time that the allied dairy interests had been grouped together.

F. B. FULMER

There were 36 exhibits of butter, 14 of cheese and 24 of ice cream, and various exhibits of creamery and dairy apparatus and a large number dealing with one or more phases of agriculture and food products.

The following organizations held convention sessions during the week:

California and Southwestern States Ice Cream Manufacturers' Association, State of California Milk Distributors' Association, California Dairy Council, California Creamery Operators' Association, California Butter, Cheese and Ice Cream Makers' Association.

The California and Southwestern States Ice Cream Manufacturers' convention was held in the Hotel Stockton while the other organization held their convention sessions in the lecture hall of the Armory.

The show was a success from every standpoint and the attendance was all that could be hoped for. The Armory floor space proved to be too small to allow exhibitors to occupy all the room they desired.

A movement was started to have each organization appoint a committee of three to hold a joint meeting when plans will be formulated for the next show.

While the Ice Cream Manufacturers opened their convention on Monday, Dec. 5th, the dairy show was not formally opened until Tuesday evening in the State Armory. The address of welcome was delivered by Commissioner D. J. Mathews, the mayor, D. P. Eicke, being absent. Mr. Mathews paid a tribute to the dairymen for the excellence of the show and its educational value, and expressed the hope that word of its attractive features would be spread broadcast so that the Armory would be thronged the remainder of the week. He also expressed the hope that the dairy show would be held in Stockton again and that the civic auditorium would be completed and available for such events.

Brief remarks were made by Fred W. Wurster, assistant manager of the Bank of Italy and Jim Thorp, prominent cattle breeder of San Joaquin county. Mrs. Shirley R. Shaw, accompanied by Mrs. J. V. Bird, and Master Aronson entertained with vocal solos and an orchestra of eight pieces played selections throughout the evening and added life and spirit to the program.

President David P. Barron, of the University of California, was unable to be present and Joel H. Hilderbrand, professor of chemistry and a close friend of President Barrows, spoke in the absence of the latter on the "Relationship of the University to Dairying."

Professor Hilderbrand in speaking of the absence of President Barrows said that he felt like a piece of oleomargarine in coming to the dairymen's convention as a substitute for the college president. However, he said that his family recognized the food value of milk and were using five quarts daily, this amounting to nearly half of their monthly allowance for food. He also said that he had once lived in Philadelphia, "the home of ice cream," that he had been reared on it and felt qualified to speak at such a gathering.

"It is interesting," he said, "to see the efforts of a group of men to make out of their business a profession. The efforts that the dairymen have put in have fruit in the movement to make their business a profession. There are different kinds of people in the world; some who work during eight hours to make money to spend after the whistle blows, while others take a pride in turning out a work of art.

"Some of you know of the immediate work that the university is doing for dairying and other farming interests through its agricultural department, but you should realize that there is another kind of connection between the university and these more practical things.

"The university stands for the discovery of truth. The work that Pasteur did was not fully appreciated at the time he was making his investigations, but we know that the work he did is very essential to the dairy industry at the present time. For a long time no one knew

FLAVOR YOUR ICE CREAM WITH

Cremilla

"CREMILLA" is better, smoother, creamier and of richer flavor than the finest grade of pure vanilla; and it's more economical.

"CREMILLA" is so concentrated as to make it the best flavor to use with homogenized cream; one-third to one-half oz. flavors perfectly 10 gallons of cream (one to one and a half pints for 500 gallons.)

Trial gallon by express on request. After fair trial, if you don't like it, send back what's left and pay us nothing.

National Fruit Flavor Co.
NEW ORLEANS, U. S. A.

the use of argon, but now the better class of electric globes have this gas in them, instead of using a vacuum, and a better and more serviceable light results. Similarly the uiscovery of vitamines has made us realize the value of dairy products because of the value of the vitamines they contain.

"The university is interested in everyday problems. It shows its interest in trying to discover new truths, in making people more comfortable, happier and giving a richer life. Private enterprise cannot take time or money to devote to this research the way the university does, so the people recognizing its value founds a university, endows it liberally with funds in order that it may carry on this work."

Prof. Hilderbrand, who did notable work in France during the world war, spent considerable time with gas problems.

Sam H. Green, secretary-manager of the State Dairy Council, spoke about the importance of the dairy industry to California, stated that the annual products amounted to $100,000,000. He told of the advantage of holding a "Dairy Show" and said that this was the first one ever held west of the Missouri river. In choosing Stockton as the birthplace of the show, the thought was that the exhibit "should be where the cows get their living" and that in Stockton "we would get the sympathy and co-operation of the people."

The Exhibits.

The first booth to the right of the main entrance was occupied by the J. B. Ford Co., representing the well known Wyandotte cleaner and cleanser.

Following around the outside of the building the next exhibit was that of the Pacific Coast Glass Works, San Francisco, showing various sizes of milk bottles and screw top glass sample jars.

The Pfandler Co., Rochester, N. Y., exhibited one of their new sanitary outlet valves for their glass-lined tanks.

The Primrose separator was displayed in the International Harvester Co. booth. There were three sizes of hand separators and one gasoline engine shown.

The Premier Machinery Co., Oakland, exhibited one U. S. ice cream freezer, a small size Elyria glass-lined tank and several of the Taylor recording thermometers and a full line of temperature instruments.

The Pacific Dairy Machinery Co., San Francisco, was combined with the Solar Sturges Manufacturing Co. exhibit and they had a line of various sized hand separators, milk cans, ice cream cans, tin ware, bottle washers, hand churn, milk bottles and other creamery appliances.

The Fresno County Chamber of Commerce had the next booth and displayed cartons representing ice cream from the Sierra and Benhams' plants and the Danish Creamery's butter, all of which are manufactured in Fresno.

The Milk Producers' Association of Central California, with headquarters and main plant located in Modesto, had an elaborate exhibit of bottled milk, butter and various other milk products in powdered form.

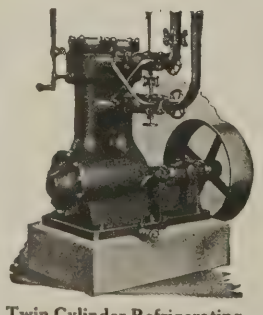
The dairy industry division of the University of California had an attractive exhibit of educational charts and display of cheese, showing the exact amount of cheese that was manufactured from a given weight of milk, starting with skimmilk and advancing in each instance 1 per cent fat up to and including 4 per cent milk.

H. F. Watkins Co., San Francisco, had a one-ton Armstrong ammonia compressor in operation and handed out literature dealing with refrigeration and dairy apparatus.

Sonoma and Marion counties had an assortment of dairy views and Stanislaus county displayed views representing the dairy industry as manifested by various concerns that are manufacturing milk products within its confines.

Kings county had a miniature reproduction of its large creameries. Nineteen years ago there were no creameries located in the county and now there are nine with an output of four and a half million pounds of butter the past year.

The California Dairy Council had a booth filled with charts, illustrations and photographs all dealing with the general theme of nutrition.



The State Department of Agriculture, Sacramento, had a large exhibit. There was a demonstration of calibrating testing glassware, illustrations of barns, silos and well kept premises as well as poorly kept ones. Petri plates showing contaminations, recording thermometers and abuses of same, and demonstrations of attempted repairs that destroyed their usefulness. The main lesson to be drawn from the exhibit was sanitation and care.

The De Laval Pacific Co., San Francisco, had a milking machine and its action was illustrated by colored electric lights that flashed on and off, cream separators, milk clarifiers and other dairy apparatus.

The Crescent Creamery Co., Los Angeles, had an automatic ice cream vending machine on display. A dime in the slot, a push on the lever and a package of ice cream with a sanitary spoon was delivered to the bystander.

California Tin Plating Works, San Francisco, had a milk can cut nearly through and opened out to show

SERVICE—NOT JUST EQUIPMENT

Elyria Equipment in the Newton-Dowd Plant consists of two 1000-Gallon Storage Tanks, three 350-Gallon Milk Pasteurizers, one 350-Gallon Butter Milk Machine and one 1000-Gallon Truck Tank—all giving complete satisfaction.

Elyria and Newton-Dowd work well together

This proves it

"It affords me much pleasure to say to you upon the completion of installation of Glass Equipment at our plant that your representatives as a whole have been on the job, anxious and ready at all times to rush the work; to do it right and satisfy all concerned."

Newton-Dowd Company
J. W. DOWD, PRESIDENT

WHEN old methods are to be scrapped—when new equipment is to be installed—what is the best method of procedure? Call in an equipment expert [as Newton-Dowd called in Elyria] and let him work *with you* in solving your individual problem. The Newton-Dowd Dairy Company of Chicago use seven Elyria Tanks to handle complete operations from the receiving and collection of milk at the country stations to the storage and pasteurization at the city plant. A complete survey of the installation, showing the plan of operation and the benefits realized, proves —*beyond doubt*—that Elyria Equipment saves money for Newton-Dowd as well as it does for every other plant that uses it.

Every Milk and Ice Cream plant has an equipment problem of its own. To solve this problem—to install the equipment and to lay out the plan of operation best suited to save money and increase plant capacity is the job of Elyria Engineers. Write for proof of Elyria superiority. It means money for you.

ELYRIA ENAMELED PRODUCTS COMPANY, ELYRIA, OHIO
Pittsburgh New York Chicago San Francisco Los Angeles Canadian Milk Products Limited, Toronto

ELYRIA GLASS ENAMELED STEEL EQUIPMENT

the interior condition of half of it that had been retinned, while the other half was rusty.

The Abbott Laboratories, Chicago, had a display of livestock remedies and disinfectants.

The Jensen Creamery Machinery Co., Oakland, exhibited the Schroeder homogenizer, ice cream cans, milk cans, etc.

Davis Watkins Dairymen's Supply Co. had one of the 100-quart Progress horizontal ice cream freezers.

The Creamery Package Manufacturing Co. exhibited one of their 100-quart Fort Atkinson ice cream freezers.

C. E. Kimball, San Francisco, had a display of cement stove silos located to the left of the main entrance.

In the center section, opposite the main entrance, was a booth occupied by the Stockton realty board, which was maintained in conjunction with the Chamber of Commerce. Literature of the county was handed out and a general information bureau was conducted.

George W. Prising Co., San Francisco, had a 400-gallon Cherry pasteurizer, Simplex separator, ice cream cans and tubs and milk cans on display.

Tell-Greefkenes Co., San Francisco, had a nice line of extracts, flavors, cocoa and dried milk in their booth.

The Associated Milk Producers, Halt, exhibited five varieties of cheese, canned skimmilk, candy made from skimmilk, bread and pastry made with skimmilk and a balanced chicken feed made from skimmilk that was evaporated and combined with alfalfa leaves.

The California Central Creameries exhibited Swiss and American cheese, Golden State butter, three varieties of condensed milk, dried milk in various forms. "Kayso," a preparation of casin to spray on fruit trees, poultry and hog feed and other milk products.

They served liberal Swiss cheese sandwiches which appeared to be very much appreciated by the throngs of people who passed their booth.

The San Joaquin county exhibit showed a list of the dairy manufacturing plants and their products along with the dairy feeds made in Stockton by the Sperry Flour Company and the Peerless Milling Co.

The Hughson Condensed Milk Co. exhibited Poppy skimmilk in dry form, sweetened condensed milk and condensed buttermilk.

The Gloria Ice Cream Co., Stockton, had an ice cream sandwich machine made by the Sanisco Company, Milwaukee, Wis., and served ice cream in that form.

Last and largest came the wonderful exhibit of the U. S. department of agriculture, covering nearly 1,000 square feet of floor space. Illustrations showing well kept versus poorly kept dairy farms were very impressive. Figures showing the increased production of cows following the use of purebred bulls were shown. Diseases of cattle and how to combat them, the story of clean milk and progressive methods were very interesting. A striking comparison of production was shown, the U. S. cow giving an annual average of 3,627 pounds of milk while the Holland cow produced 7,585 pounds.

Several concerns had representatives present at the show, but owing to lack of space they did not have exhibits.

In the lecture room adjoining the exhibit hall, educational motion pictures were shown each evening.

The show formally closed on Saturday evening, Dec. 10th, and was pronounced by the officials in charge as being a complete success.

IOWA DAIRY SHORT COURSE.

The annual short course for experienced operators is offered during the period of February 8 to 18, 1922. This course is divided into six distinct courses, the ice cream course being as follows:

II. Ten Day Course for Ice Cream Makers.

1. Laboratory Practice.

Standardization of Cream and Mix.
Homogenization.
Preparation of Special Ice Creams.
Brick Ice Cream and Fancy Molds.
Decoration of Ice Cream.
Testing and Analysis.

2. Lectures.

Afternoons will be devoted to lectures on the following subjects: Standardization, Pasteurization and Homogenization of Cream, Standardization of the Ice Cream Mix, Manufacture of Various Kinds of Frozen Products, Marketing of Ice Cream, Daily Records, Losses in the Ice Cream Plant, Ice Cream Factory Refrigeration, Bacteria in Relation to the Ice Cream Industry, Fermented Milk, Soft Cheese Making, Testing of Milk, Cream and Ice Cream.

IV. Ten Day Course in Dairy Bacteriology.

A laboratory course will be offered in the methods of determining the numbers of bacteria in milk, cream and ice cream and the numbers of yeasts and molds in butter. The dairy bacteriological laboratory will be open during the forenoons nad those interested can spend as much time there as they desire, and then attend the lectures in the other courses that may interest them in the afternoon.

V. Ten Day Course in Testing and Analysis of Dairy Products.

Work in this course will be divided between two laboratories. One laboratory is equipped for general work in milk and cream testing, and the other for special work in butter and ice cream analysis, etc. Students taking this work can attend any of the lectures given in the afternoon.

A laboratory fee of $5.00 is charged for all courses

For further information, address Dairy Department, Iowa State College, Ames, Iowa.

MODESTO MILK COMPANY HAS MODERN PLANT.

The Modesto Milk Co., of Modesto, Calif., maintains a modern, up-to-date ice cream department in their large plant. Perfection ice cream is manufactured here, and the number of trucks used in their service delivery are operated with a quickness which insures fresh supplies constantly. The territory covered is a wide one, and it is easily seen that to cover all this space an efficient organization must be maintained.

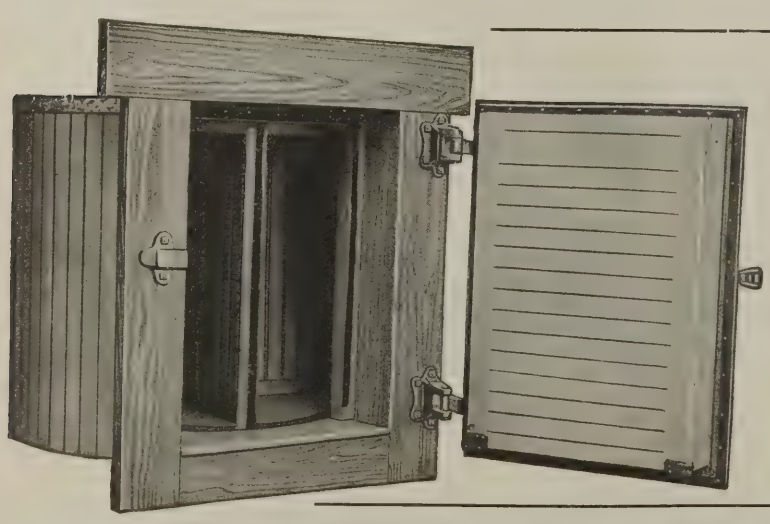
The local plant is capable of making one thousand gallons of ice cream daily. Many days this summer this capacity has been the output, and even on the coolest days, no less than five hundred gallons were made.

Perfection ice cream is manufactured in an ideal spot and gets the pick of the richest creams from the best dairies.

John A. Wenger is sales manager, and H. Nyborg is superintendent of production. Sales Manager Wenger spoke of the ice cream situation as follows: "We feel very encouraged over the future prospects of the ice cream business. People have taken ice cream out of the luxury class and have placed it where it belongs, in the nourishing, healthful food class."

Part of a Fleet of Trucks Which Are Used by the Modesto Milk Company to Distribute Perfection Ice Cream.

A NEWSPAPER WRITER FINDS OUT HOW ICE CREAM IS MADE.



The following interesting clipping came to our attention and is a story of a visit of a newspaper writer to an ice cream plant to find out just how ice cream is made, and although the article is a little "off date" we found it interesting enough to pass on to our readers.

By Flora McDairmid, Article No. 6 of a Series in Stockton, Calif., Newspaper.

"Good, honest beads of sweat upon his brow while making ICE! Imagine it, can you? For they make their own ice over at the Gloria Ice Cream Company, and the man was hard at freezing at the time.

"I chose the manufacture of ice cream this week for a distinct reason: I knew it would be intensely interesting.

"There are three large vats upstairs with large ammonia coils running through them. These are not really made of ammonia but a solution of the stuff is kept circulating inside the coils to keep the temperature down. Then cream and sugar and gelatine and a few more things (they didn't give me the exact recipe) are mixed

Homer Manufacturing Company

Homer City **Penna.**

up and pumped into these so-called vats, where such mixture can remain for over two weeks before made into ice cream. Great Scott and little catfishes, I had no idea in the world that cream would keep that long without souring, but I am assured that it will not only keep, but is really much better after having stood that long.

"For about every half hour in every twenty-four a little engine is started which makes the coils go — I haven't found out the principle by which they work, yet, but they seem to keep turning and winding and when they get to the end they just kind of drop off—the same idea as a barber pole.

"What a pity, I thought, if anyone should fall into the mixture, for there is $700 worth of embryonic ice cream in one vat. It, the goo, looks like white velvet, draped like you had a lot of it.

"Connecting from the container are pipes which run downstairs to the freezers, so we have to go to the end of the room and downstairs. There is a huge swimming tank on the second floor—or this was my impression, but I was told it contained simply "surplus" water—I have no idea why this would be objectionable for swimming purposes?

"The freezer man downstairs turns on a little faucet or the pipe that the mixture comes through and this runs into a freezer, an odd, cylindrically-shaped thing which turns inside and which does the freezing in approximately 13 minutes. Forty-eight hundred gallons a day are made in these freezers. When the 13 minutes have passed into the great beyond, another faucet at the base of the freezer is opened and out pours the most wonderful looking no-name-to-express-it stuff you ever saw. The ice cream being made was strawberry, and it just seemed like pretty pink waterfalls to watch it coming out.

"The officiant of these ceremonies certainly has to be on the que vive, for he just puts one freezer under to catch the heavenly goo, when that fills up and he rushes in another. Say! It's enough to give you nervous prostration watching him, wondering if the next can is going to arrive in time—and it always does.

"After it is put in the freezers, or on like cake plates (for the ice cream bricks) it, the ice cream, goes to the hardening room where it stays until it is shipped out. And if you ever want to acquire a stony countenance, go to the hardening room. There are curtains hanging here and there, with little doors opening and exiting on all sides, and I learned to stay away from the curtains, and if possible, ditch the doors, because behind each of them was colder air than the air before. The first compartment was colder than anything I ever witnessed—but I didn't brag of that long.

"Come in here—see these are the bricks!" And in I went; well, I felt my fingernails going blue, and I kind of stuttered to 'Let's go in there,' pointing to another door. 'Well, this is much the same thing,' I was told as I gently forced through the door, 'only a few degrees colder!' I knew I couldn't last long there so I pointed out another door, and do you know that in that awful maze each door I picked out had a little more cold air behind it than the one before. Giddily my thought wandered to those wonderful verses of Longfellow, from the 'Wreck of the Hesperus,' and that line which says, 'The captain answered never a word; a frozen corpse was he!'

"Then, by some strange coincidence, the superintendent suggested that we get out, and I seconded, thirded and fourthed the suggestion. When we got to the first compartment, the one you remember which I likened unto the North Pole, or something, he had almost to drag me out, for I insisted upon staying and getting warm!

"The manufacture of ice cream is a wonderful industry; ice cream enough for about 200,000 cones being made daily. In the making of brick, I forgot to say, one layer is poured onto the tray, after that has hardened, a second color is put on and, if that kind of a brick, a third, still later on.

"The flavoring room is one of the most wonderful smelling rooms in which I have ever been, and the strawberry is the most wonderful tasting taste which has ever been in me. I had a dish full of pink ice cream, and ate it with one of those little teeny spoons, too, and the ice cream was mighty good."

Indiana Ice Cream Manufacturers' Annual Meet

Lively Meeting held in Claypool Hotel, Indianapolis, December 14, 1921

The Indiana Manufacturers of Dairy Products opened their annual session on December 14th with a noon luncheon given at the Claypool hotel, Indianapolis, where Mayor Chas. W. Jewett welcomed over one hundred members of the association to his city.

He also appealed to those present to lend their assistance in securing the next National Dairy Show for Indianapolis, not alone for the good of the city but more so for the entire state of Indiana. Judging from the words and mental picture presented by the mayor, one would easily form the opinion that Indianapolis would be the logical place to hold the Dairy Show.

After the luncheon the members adjourned to the convention hall where the Indiana Ice Cream Manufacturers' Division annual meeting was properly called to order by Bert G. Moore, general president of the allied association. He informed the members that Chairman J. C. Kreusch of the ice cream manufacturers' division, on account of sickness, was unable to be present. Therefore A. P. Holly was chosen as temporary chairman. The hall was well filled and the attendance was reported as being larger than any preceding meetings. This speaks well for Mr. Holly, who is general secretary.

Unlike other state associations, with the exception of Iowa and Michigan, the Indiana Allied Association emplays a paid secretary, who devotes his entire time to the association's work. Nineteen hundred and twenty-one was Mr. Holly's first year as general secretary, and it must have been very gratifying to him to stand before such a large gathering, which, in words and otherwise, placed the stamp of approval on his work during the past year. Much success to Mr. A. P. Holly for 1922 from The Ice Cream Review.

One of the speakers on the program was Timothy Mojonnier, of the Mojonnier Bros. Co., Chicago, Ill., who spoke on "Packaging Ice Cream Directly From the Freezer Into the Carton." The following is the address:

Packaging Ice Cream Directly From the Freezer Into the Carton.

By Timothy Mojonnier, Chicago.

It is a pleasure to be able to discuss at this time a subject in which all the members of this influential association are keenly interested. The success of the ice cream industry is due in a large measure to the fact that in the past, new inventions of merit have been put into practice by the manufacturers as fast as their advantages were proved. This is the spirit that will continue to make the ice cream industry a great industry.

Ice Cream Packaging Machine.

The new era in packaging ice cream is made possible by the invention of the ice cream packaging machine, which has been placed upon the market during the current year. This machine is the result of years of costly research and experimentation. The pioneer in this new art was Mr. E. J. Retzbach of St. Louis, who spent many years, and the savings of a lifetime in the development of this idea, and to him was granted basic patents for packaging ice cream directly into the cartons.

This new machine receives the ice cream just as it comes from the freezer, and while it is still in the plastic condition—packages it directly into the carton, one, two or three flavors at a time. The filled cartons are then transferred to the hardening room, and the ice cream is hardened in the carton, ready for delivery to the trade.

This machine operates entirely automatically. It can be located so that the contents of the freezers can be discharged directly into the three compartment hopper which is refrigerated and insulated, or the contents of the freezers can be discharged into suitable cans, and in turn, the cans can be dumped into the respective compartments of the hopper.

From the hopper, the ice cream passes through the machine, and into the cartons, in exact predetermined, measured amounts, of each flavor. The standard tuck-end type of carton is used. This is the type of carton now most commonly used, and it is the type that possesses the most advantages over all other types, both from the standpoint of the manufacturer and of the consumer. A parchment bag or a parchment liner is inserted into the cartons before feeding the cartons into the machine. By experimentation and by consultation, with a large number of manufacturers, we found that the use of the parchment bag was greatly desired. The majority of the manufacturers consulted favored its use since this paralleled their present method of wrapping the hardened bricks in parchment liners. It helps to prevent leakage both at the time of filling, and at the time of removing the ice cream from the carton. There is less slop and waste of ice cream, and but little muss upon the part of the consumer when cutting the brick. However, any manufacturer who wants to fill his ice cream into the carton without using a liner, can accomplish this result by using a properly designed five panel carton made of the proper stock and properly paraffned.

After being filled by the packaging machine, the car-

SALT LAKE CITY, 355 Pierpont Ave

tons are removed, inspected, sealed, transferred to the carry-out tray, and the tray removed to the hardening room. If so desired, the cartons can be passed through a tying machine after being filled. The best results are being obtained by using a galvanized pan to receive the filled cartons at the machine. This pan has capacity to hold 24 quarts upon the ends. In this pan the sides of the cartons are well pressed in, and the bricks completely retain their square form while hardening. The bricks remain in the pan in their hardening room until they are delivered to the wagons.

This machine will fill either pint or quart size cartons of the common brick type. By making a slight change, it can be made to fill half pint, pint or quart size carry home pails. Likewise it can be modified to fill round cartons of various sizes.

One model is geared to deliver twenty quarts per minute, or 1200 per hour. Another model is geared to deliver 900 quarts per hour. Its limit is governed by the ability of the operator to feed in the cartons, or the output desired.

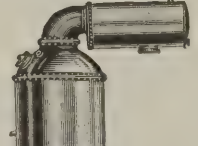
The standard model of this machine will fill any flavors of ice cream that have passed through the freezers. For example, strawberry, cherry, each or any of the other common fruits ordinarily used to flavor ice cream, if whipped in the freezer with the ice cream, can in turn be filled with the packaging machine. Likewise, it will fill with fine results, sherbets of the proper composition and overrun, along with ice cream.

Advantages From a Manufacturing Standpoint.

We have considered what the machine is, how it operates, and what it does. Let us now consider some of its advantages to the manufacturer. Under the old methods, at least twelve operations are necessary in order to produce brick ice cream. Each operation requires labor, or as the engineer would state it, the expenditure of a given number of motions. The manufacturer pays for each of these motions.

By means of the packaging machine, the total number of operations is reduced from twelve to seven. The exact saving in labor that is effected by the new method, will vary with the output of the plant, and the manner in which the work is organized. In any plant, whether large or small, the eight following labor operations are dispensed with, under the new method: (1) Labor of pouring the ice cream into the molds. (2) Transferring the molds to the hardening room. (3) Removing the molds from the hardening room to the cutting room. (4) Dipping the molds in a hot water tank. (5) Removing the ice cream from the molds. (6) Cutting the slabs into bricks. (7) Wrapping the brick in the parchment liner. (8) Inserting the hardened brick into the carton.

The packaging machine makes it possible to route the brick ice cream through the plant, by the shortest and most direct lines, thus saving both time and labor.



Another advantage from a manufacturing standpoint is the saving in ice cream that is effected by the new method. Under the old method, there is usually a loss of ice cream while transferring from the freezer to the molds, due to slopping. There is a loss due to the fact that the molds are frequently oversize, to allow for cutting. There is a loss in cutting the slabs. Conceding upon a most conservative basis, the total loss to be five per cent, upon an output of 25,000 gallons of brick ice cream per year, this means an aggregate of 1,250 gallons of ice cream. It is therefore evident that one of the greatest possibilities by the new method from a manufacturing standpoint is the savings in ice cream that it is possible to make. A saving, which under the old method, resolves itself into a sheer loss.

Several other manufacturing advantages could be enumerated. There is a considerable saving in floor space, as against the old method. The new machine occupies about the same room as one 80-quart freezer. It will gradually replace other equipment now used for making bricks, such as molds with covers, tables for filling the molds, dipping and cutting equipment, and tables for wrapping and packing the bricks. It saves nearly half the space now used in the hardening room for making bricks, since the space now used for hardening the ice cream in the molds can be utilized for hardening the ice cream in the cartons. At the same time, there is a saving in the expense of refrigeration. What this amounts to has not been accurately determined, but it is bound to be a considerable loss. The refrigeration now required to cool the molds, and the mold covers can all be saved. The loss of refrigeration that results when the molds are transferred into the hardening room can all be saved. There is a loss in refrigeration every time the doors leading to the hardening room are opened; with the new method, the loss of refrigeration from this cause is easily cut in two. Where the practice is followed of hardening the successive layers of ice cream in the mold, the loss is directly proportional to the numbers of times that the molds are put in, and taken out of the hardening room.

In removing the ice cream from the molds, the layer next to the mold usually melts to a considerable extent. When the brick has been returned to the carton after cutting, this softened layer must be hardened again, and this is done at the expense of refrigeration. The manufacturer can double his brick business in the space required under the old method, or he can do the same

volume of business in half the space. A large saving in refrigeration is effected in either case.

Advantages From a Sales Standpoint.

We will not consider the advantages of the new method from the standpoint of its effect upon the sales of ice cream. The question in your mind is: What is the effect upon the quality of ice cream to package it by this new way? The new machine operates best when the ice cream is of heavy viscosity when fed into the hopper. As every observing manufacturer knows, this is the condition that will produce the best ice cream—a product free from large water crystals, and therefore smooth to the taste.

Under the old method, the layer of softened ice cream next to the mold surface, usually hardens into a coarse, icy or grainy crust, causing the defect commonly known as icy bricks. This is caused by the fact that no air can be incorporated into the water drops while the bricks are being hardened. Under the new method, this difficulty is entirely eliminated. The water crystals are all of uniform size throughout the brick. The product is most pleasing to the taste. The texture and smoothness of the product is unexcelled when the ice cream is filled directly into the carton, by means of the packaging machine, and besides, this result is accomplished without any shrinkage in the volume of the brick.

By the new way, the exposure to the air of the ice cream is reduced to a minimum. Its contact with the hot water is entirely eliminated. The ice cream is not touched by human hands, and its possible contamination by contact with the tables, and other equipment, is entirely avoided. The good flavors are all sealed in. The possible bad flavors are all sealed out. These are all arguments upon which the manufacturer can capitalize in his advertising, and in his sales promotion.

Packaging Bulk Ice Cream.

Another advantage is the large possibility that the new method offers to package bulk ice cream for the dealer. You are all familiar with the present method of handling bulk ice cream by the dealer.

We made a canvass among all the leading dealers of Oak Park, Ill., and also among a considerable number of ice cream manufacturers, in order to get the viewpoint of all concerned, in this problem. This investigation disclosed the following facts:

(1). The consumer buys bulk ice cream in preference to brick ice cream for two principal reasons. First, he believes that bulk ice cream has better flavor and better texture than brick ice cream, and in many cases, the single flavors are preferred, and the same are not always available in brick form. I believe that you will agree with me that this view is largely a matter of prejudice or of opinion, granting that the brick ice cream is made with the same care as is used in the preparation of the bulk goods. Second, the consumer believes that in buying bulk ice cream, he receives more for his money even if he pays a premium of from 30 per cent to 40 per cent for the same volume of ice cream. This view is not always correct. When the ice cream in the can is frozen very hard, it is difficult to avoid air pockets when filling the pail, so that in this case the consumer may get considerable less than the amount that he bought. The quantity in the carton is under the control of the clerk who dishes out the ice cream. One clerk may serve more, another less than the given volume. When the ice cream in the can if soft, the consumer benefits, but this is done at the loss, and at the expense of the dealer. The ice cream in this condition is seldom entirely satisfactory to the consumer.

The average consumer expects only the volume, or the weight of any products which he may be buying. The satisfied consumer is the one who receives uniform quality—that is flavor, texture, body, food value and uniform weight or measure. In other words, equal value for his money at every purchase.

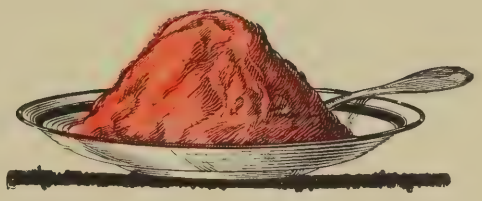
(2) The dealer sells bulk ice cream from necessity rather than from choice. He discourages its sale by placing a price of from 15 cents to 20 cents per quart over the price of brick. He states that even at the increased price, his bulk business shows him a loss. One large dealer reported a cash loss of $3.50 in the sale of 70 gallons of bulk ice cream in one day. This did not take into consideration the loss in wages and in overhead. Had this been packaged at the factory, and sold at 10 cents a quart profit, he would have realized a profit of $28.00 for the day. Sales are lost during the time consumed in filling the cartons. An expensive clerk, or the owner himself have to give their valuable time to this menial operation.

The dealers interviewed were unanimously of the opinion that the logical place to package bulk ice cream is in the ice cream factory. One large dealer in Oak Park even now has his bulk ice cream put up by hand at the factory, and he stated he would buy his ice cream only from a factory that would package his bulk cream. The majority of them believed that if they sold only bulk ice cream packaged at the factory, that the consumer would accept it, and be satisfied. It might take advertising and some educational effort to bring the consumer to this viewpoint.

Every dealer interviewed recognized that bulk ice cream packaged at the factory meant to him an assured profit per package, and more time to devote to sales.

DULUTH
C. C. Shipping Tubs
Are Cream Savers

Our Eastern Style Tubs, 29 in. high, give plenty of packing room for your long shipments.



Features which insure durability are:

1. Standard width staves, 1 3/16 in. thick, of select Washington Fir.
2. Top and bottom hoops of 1½-in. 16-gauge galvanized iron.
3. Heavy bottom construction, beer keg type, which insures added strength.
4. Beehler 4½-in. heavy galvanized handles.

Greater Gallonage for 1922

Plan for it NOW

Winter-time is a good time to start making Orange-Crush, Lemon-Crush and Lime-Crush Ice Creams and Sherbets. If you can obtain exclusive rights on these quality flavors you can put new life into your winter business, increase your prestige, and gain greater gallonage all through the year.

Oranges and lemons are the most popular year-round fruits. Orange-Crush, Lemon-Crush and Lime-Crush are the fastest selling fruit drinks in the world. These same flavors in ice creams and sherbets are rapidly becoming as popular as are the famous drinks.

More than 500 leading ice cream manufacturers now use the "Crushes." Steady growth in daily sales proves that ice cream buyers **want** these delightful citrus flavors and continue to buy them in ever-growing volume.

Big Hit at the Convention

At both the Buffalo and Atlanta Conventions the Orange-Crush Special Brick was a big winning feature. Its extra deliciousness caught the fancy of the crowds. **Your** customers will be delighted with this Special. You should have the formula. It is a real trade-getter.

Our folder of Suggestions for Week-End Business will be sent you free on request. Write for it today.

ORANGE-CRUSH ice cream

"We like them and so does the trade," writes M. F. Stuart of Springfield, Illinois. "We have had wonderful success with your Orange-Crush, Lemon-Crush and Lime-Crush," writes The Weber Ice Cream Company of Jefferson City, Mo. Similar praise words come from manufacturers in every section. Let us send you proofs. They are convincing.

The "Crush" Compounds make a product of surpassing quality—with color, fragrance and flavor so pleasing that repeat orders are sure. They are genuine fruit flavors; they will not freeze out; they are uniform, giving you control of flavor and color; no additional color is necessary.

Quality, extensive advertising and selling co-operation will win for these ice creams and sherbets just as they did for the drinks.

Ice cream is a product that represents a quick turnover. As a rule, the dealer receives the cash for the ice cream before he has to pay the manufacturer's bill. He can therefore sell it upon a close margin, and still make a very satisfactory earning. By handling bulk ice cream packaged at the factory, he can make more sales in a given time, and thus reduce his help and increase his profits.

(3). The manufacturers interviewed were somewhat divided in their opinions. One group assumed the attitude: "What do we care if the dealer loses by giving over measure? This means more gallons for us." Upon close analysis, I believe that the majority of you will agree with me that this viewpoint may lead to an erroneous conclusion. The whole fabric of commerce, and of human endeavor in its many branches is predicted upon the little word "profit." If the dealer cannot make a profit in selling bulk ice cream, eventually the manufacturers will feel the effects of it. The fact that the dealer is even now charging from 30 per cent to 40 per cent more for bulk than for brick ice cream must reduce the sale of the brick. Increase the price and decrease the demand, or decrease the price and increase the demand, are the economic rules that govern the world over.

The second group which included the majority of the manufacturers interviewed recognized the great possibilities in packaging the bulk ice cream for their dealers. Their bulk ice cream like their brick ice cream would reach the consumer under their label. By means of the packaging machine the bulk ice cream could be packaged at but little if any additional expense over the cost of handling bulk ice cream in cans. The wear and tear upon the cans, the handling and washing of the same would largely affect the carton cost. Increasing the sale of packaged goods would decrease the unit cost thereof. By constructive advertising the consumer would soon learn that bulk ice cream packaged at the factory has the same quality as bulk ice cream from the dealer's cans. Advertising packaged bulk ice cream to sell at the same price as brick ice cream would be bound to increase the consumer's demand. To realize the best possibilities would require close co-operation between dealer and manufacturer. The dealer would have to be provided with a good brick cabinet, and the manufacturer would have to keep the dealer supplied with fresh stocks. But this would pay, and it would lead to greater ice cream sales.

The same problem has been encountered in nearly all other food industries. It seems but a few years since packaged oatmeal, packaged soda crackers, packaged nearly everything else were unknown. Likewise with nearly all kinds of dairy products. Selling to the consumer in package or containers is now the rule. The old order has been reversed. The new era is offering equal opportunities to the ice cream manufacturers.

So in concluding let me repeat that this new invention offers great possibilities to the ice cream manufacturer, to effect large economies in manufacturing, and at the same time to greatly increase his sales.

* * *

A cordial invitation was extended by Bessire & Company to attend a demonstration of the Rogers Automatic Ice Cream Brick Maker at the Furnas Ice Cream Co.

Indiana Manufacturers, Claypool Hotel, Indianapolis.

Discussions noted below followed the address of Mr. Timothy Mojonnier:

Mr. Edward, Marion, Ind.: How much more money can the manufacturer get from the dealer in packaging ice cream in pints and quarts, using the carry home pails?

Mr. Mojonnier: I might answer this question somewhat indirectly. We figured under many different conditions that the additional cost of packaging ice cream in carry home pails as against putting it in cans amounts to about six cents a gallon. If the manufacturer would charge the dealer ten cents per gallon more, he would get more than under the old method. Under some conditions, the dealer might want to charge either more or less than ten cents per gallon.

Mr. Atkinson: In figuring this cost, how many gallons do you figure per day?

Answer: This varies under a good many different conditions. I would say ten cents would be the outside limit, even upon as small a gallonage as a few hundred packages per run. Obviously the larger the run the lower the unit cost will be.

Mr. Atkinson: What amount do you base this six cents on?

Answer: Up to 100,000 quarts per year. The outside limit would probably be about ten cents for a small concern.

SEVEN YEARS AGO.

The picture below was taken at a Michigan convention of dairy and ice cream manufacturers held in Flint, Mich., in year of 1915, no doubt it will bring back memories of the past and many of those who attended it. They can call the pleasant time they had there and R. E. McFarland, the big boy who sells Essex Gelatine, can have another hearty laugh when he sees this picture for it will tell him of his experience with the school children on that Friday night, for they surely liked him so much that they done their best to carry the booth and all away and no doubt would have taken Mac along with them. He stood there laughing his sides sore and he thought it a good time to have some fun while he was staying in the booth during C. J. Yuncker's absence for a few minutes. This booth was a popular one during the convention and was well lighted with electric signs advertising the popular flavor, "CARAMALA," manufactured by Rex Extract Company, Brooklyn, N. Y., and was headquarters for many who attended the convention. Yuncker will have a booth at Saginaw convention for the Rex Extract Co., where orders for "CARAMALA" and "MEXOCINE" will be taken. Yuncker invites all to call at the booth and make it their headquarters while attending the Saginaw convention in February 14 to 17, 1922.

Flint, Michigan Show, 1915.

certainly would be willing to write thousands of them.

I note your request for some little story or joke on some of our fellow boosters here in Michigan. To tell the truth, these Michigan Dairy Boosters are so hard to get anything on that it is rather difficult for any one to get a joke on them.

I was just wondering if some of these up-to-date ice cream manufacturers ever stop to think how the old place is going to look 500 years from now. Will the K. & K. Ice Cream Company still be turning out the best ice cream in the world? Will the future manager when he comes into his office for his five-minutes daily work look up at your picture, perhaps feeling a bit sorry for you and your crude methods, or will he regard you as one of the greatest old boys that ever lived?

Did you ever think what the future historian might say about you? It will read something like this, "It appears what is now our principal food was discovered sometime during the nineteenth century, but did not come into very general use until the latter part of the twentieth cenury. Although it appears that as early as 1922 the ice cream industry was fairly well organized, copies of a trade journal published in Milwaukee, Wis., called The Ice Cream Review, now on file in the public museum, will convince the most skeptical that ice cream was made and eaten during the first quarter of the twentieth century. It appears that about the middle of that century some of the factories who were turning out that product, sacrificed quality for profit and were soon swallowed up by their more far-sighted competitors.

Our friend, Harry Geer, of Cadillac, Michigan, says, "A future historian will never write that about my factory, for years after I smoked my last cigar, taken my last drink, eaten my last meal, and the Elks have said all the good things they could about me and carefully hid all the bad things, for years after my tombstone has crumbled into dust, people will still be eating Cadillac ice cream."

We hope so, Harry.

W. G. FINCH.

OKLAHOMA ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 22)

ment of four freezers so that the mix would remain in each freezer but three minutes and then flow into the one below it thus saving three-fourths of the time in freezing. The display of packaging machines, which were shown in actual operation, attracted great interest, especially after the discussion on brick ice cream. The machines would do all that was claimed for them but seemed too large an investment for the volume of business in brick ice cream in the average factory, and the same was true of the wrapping and tieing machines. In the way of containers several new ideas were shown especially as to iceless or insulated containers. Some of those shown appear practical and will no doubt be tried out.

Much effort was made to enlighten the manufacturer in regard to refrigerated delivery equipment but the subject is of little interest here.

The convention was held at Hotel Radisson, Minneapolis, and the dairy show at fair grounds, midway between Minneapolis and St. Paul. Every courtesy was shown visitors by resident manufacturers of both cities and a good impression was created. The climate was equally delightful as Oklahoma at that time and pastures as green as June in this state. Great herds of Holstein cattle were in sight on nearly every farm and it was easily seen that Oklahoma will require a long time

to gain a standing in the dairy industry. The attendance from the southern states was very light, but one representative, I think, each, from Arkansas, Kentucky, Louisiana, Texas, and Oklahoma.

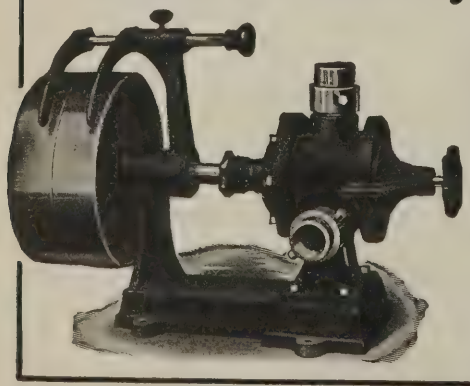
It was admitted by practically all the larger manufacturers that gallonage would be rather less than the 1920 season and it would seem from certain developments as to distributing the product that the industry is facing a condition which may mean some radical changes in present methods. However, it is thought by many that some changes which will no doubt come about before another season will increase the amount consumed. Probably the most important change will be elimination of luxury tax and next will be a more nearly, popular price by the dealers, while it is hoped and expected financial matters will be in better condition and the public more able to gratify their desires.

While no lack of confidence in the future of the business was expressed, still it was readily seen the manufacturers longest in the business recognize the changes taking place, so it behooves every manufacturer to study his business diligently and improve his methods and service wherever possible.

Report of Delegate to Farm Congress—Mr. J. W. Parker, Enid, Okla., Chairman: Letter from Mr. Parker was read advising that account of sickness he was unable to be present. Consequently no report.

Tuesday, December 13th, 1921.

Meeting called to order by President Porter at 10:30 A. M. He called attention to the fact that Prof. A. C. Baer, of Stillwater, Okla., had honored us for the past three or four years with an address and in each instance he had a message of great importance to the industry and that he was sure that he had a great message for us in his address on "Preparation of Ice Cream Mixes." He then introduced Prof. Baer, whose address will be printed in a later issue of The Ice Cream Review.



Mr. J. W. Ridgway of the dairy development department of the Mistletoe Creameries, Ft. Worth, Texas, gave a short talk along dairy development lines.

DAIRY DEVELOPMENT.

By Prof. J. W. Ridgway, Ft. Worth, Tex.

I feel my inability to address an organization of this character because from the manufacturing side of ice cream I have had very little experience, and know very little about that particular subject. I want to assure you of my appreciation to the various discussions, and say that I have gotten a great deal out of them and feel amply repaid for my visit at this time.

Taber Creamery Pumps

are the most sanitary because they are entirely dissectable. Demand a Taber Pump from your jobber. If he cannot supply you we will sell you direct. Address:

Taber Pump Company
297 Elm Street
BUFFALO, N. Y.

I did not come to your city with the expectation of attending your convention,—did not know it was in progress until last night, and heard that coming out of Fort Worth. I was coming up here for a special business engagement I have this afternoon and tonight.

The interests of Texas and Oklahoma are quite identical and I bring greetings to you this morning from Texas. In fact our interests are so identical at times our boundary lines become confused, and we have to resort to the courts to know where Oklahoma commences and Texas leaves off.

I am devoting my time to dairy production, and as usual, they are with me this morning. I will speak to you briefly along this line.

I was connected with the A. & M. College for ten years as head of the dairy department, but largely along the lines of production.

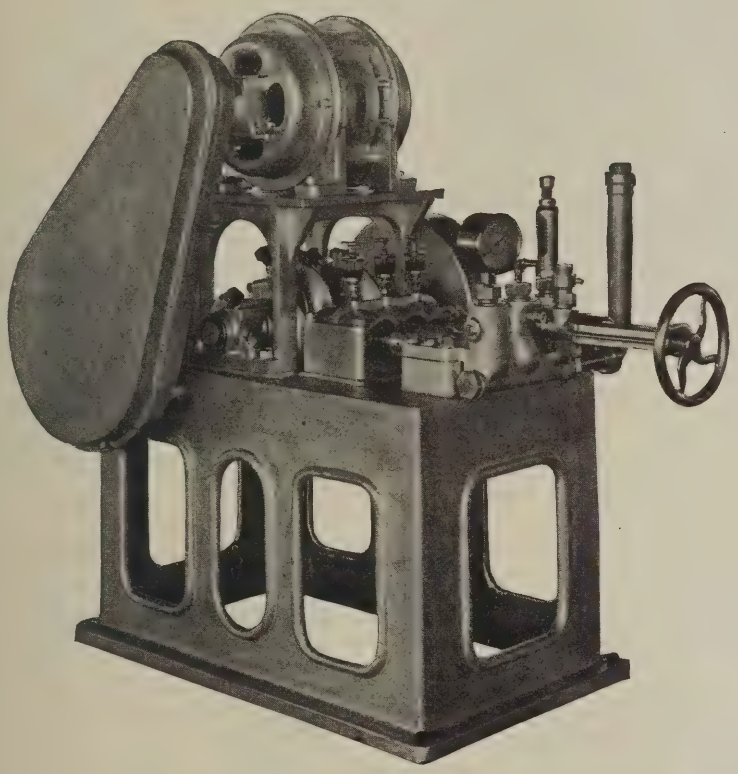
The interests of the producer are identical with your interests,—things that make for prosperity on the part of the producer, and we are passing through at this time a rather peculiar and critical condition. Produce, as you know, is much higher than under pre-war conditions and consequently if we have to depend on industry as it should be developed, we should give attention to this particular point so that the manufacturers will get their share of the income from dairy products. I cannot give you off-hand the figures that a dairy man can. He has to spend two and one-half gallons of milk with one bushel of corn so that we, as manufacturers, must give certain attention to rectify those conditions.

We must give consideration to the reduction in cost of manufacture to the cost of distributing. Our own organization during the past twelve months, with all brother manufacturers have given much time to this matter, both in our manufacturing and sales divisions. I cannot see any great improvement in the next two years. The purchasing power of the farmer today is probably less than two years ago. Now, until that purchasing power, which represents from 50 per cent to 70 per cent of our nation, we cannot have any great improvement in our manufacturing improvements whether in ice cream or otherwise.

The cost of manufacturing must be reduced. I would call your attention to that important item again.

Other things you should direct attention to is in rendering the samples to the producer so he can cut down the price. You might think it is a far-fetched idea on the part of a commercial organization to bring about improvement in the costs of production, but it is most vital, the raising or increase of the production of the individual company, which can come only through better companies and better methods and management.

And we are also interesting the boys and girls of our state in doing some work in your own state in this improvement of live stock. Last year our organization sent four boys to the A. & M. College, and next year we will send half a dozen between the ages of 14 and 18. We are co-operating with both states.



I understand an Oklahoma county agent is selecting 30 dairy companies to come out of Texas to Oklahoma.

I am glad to have the privilege of coming up here and meeting you gentlemen, and I hope, too, that some time you will come to Texas.

I will use my best efforts to get Prof. Baer to talk to the manufacturers next year. I am very grateful for the privilege of having this small space on your program and hope to become better acquainted with you, and thank you for your attention.

(Continued on page 141)

Money Can't Buy a Better Machine Than the Gaulin Homogenizer

THE owner of a Gaulin Homogenizer is assured that regardless of what he spends, he cannot purchase a finer built or more efficient Homogenizer.

The Original

The Gaulin was the original machine in America designed for making products homogeneous or viscous. Although its wonderful efficiency attracted a number of competitors, it has been as impossible for the imitator to equal the performance of the Gaulin as it is for an imitation diamond to equal the brilliancy of the genuine.

Made with Painstaking Care

The working parts of the Gaulin are made with the same painstaking care as those of the finest custom built automobile and of as fine selected materials. Its excellent construction is reflected in the long life of the machine, many of them having been in use ten years or more.

The Gaulin Spring Homogenizing Valve

The Gaulin Homogenizer is the only machine equipped with the Gaulin Spring Homogenizing Head which homogenizes all parts uniformly fine. Furthermore, this is the only machine by which the whole mix can be homogenized at a pressure of 4,000 lbs. and the pressure maintained without the constant attention of an operator.

Write for interesting booklet entitled "The Story of the Homogenizer."

ICE CREAM MAKING MACHINERY
REFRIGERATING SYSTEMS
DAIRY MACHINERY AND SUPPLIES

Southward the Course of Dairying Takes its Way

By JAS. J. HARVEY, Manager Dairy and Ice Cream Department, Bessire & Co., Inc.

The above paraphrase on the westward course of civilization is very apropos of the present southward tendency of the dairy industry.

Not many people of the southland and particularly no northerners, unless their business relations are closely associated with the present status of the dairying throughout the southern states, know of the rapid development that is taking place in dairying south of the Mason and Dixon line, and particularly in the states of Alabama, Georgia, Florida and South Carolina.

JAS. J. HARVEY

Dairying in the South has always been carried on in an oscillating way, due to the general apathy of the southern farmer for raising his own dairy feed and also to the lack of an all-year-round market for his milk and cream. His mind has been running in a single furrow and his thoughts of farming have always reverted to the one-crop system—that of cotton.

The dairy cow and prosperity have always marched hand in hand in all climes, and I believe it no wild conclusion to draw that as dairying properly develops in the south, prosperity will increase. Prosperity in financial returns is not all the benefit that will accrue. Better nourishment and better health and finally greater achievements will follow in the wake of increased dairying.

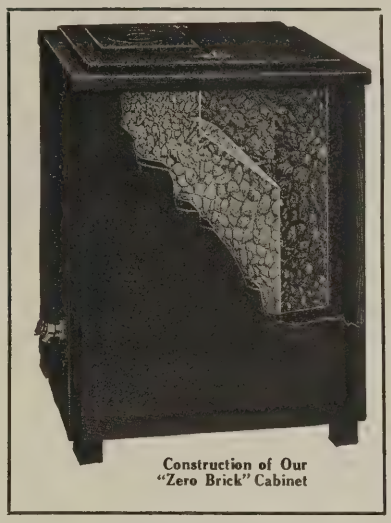
Dr. E. V. McCollum of the School of Hygiene and Public Health of the Johns Hopkins University of Baltimore, who, through his investigations, has done more than any man living to encourage the use of milk and dairy products in the human diet, says, "The nations that have used large amounts of dairy products in the diet are the most efficient and highly developed races on the earth," and "The keeping of dairy animals was the greatest factor in the history of the development of man from a state of barbarism." So from a health standpoint as well as from all other angles, dairying should be extended.

Now to go back to the theme of this article—Dairy Development in the South. I recently had a letter from the owner of a large dairy plant in the north, inquiring for causes of his inability to sell his product in Florida and the south. He stated that when recently he quoted his former customers the lowest possible price on his product, delivered, they had told him that his prices were entirely out of line, and that they had been offered the same quality product at much lower figures. He stated further that he knew of only two points that were competitors of his, New York and a large dairy product plant in southern Alabama.

It was necessary for me to inform this owner that he was not abreast of the present dairying conditions in the south. I told him that business he had formerly enjoyed in Florida during the tourist season was gone from him, never to return, and that the south was taking care of its own.

I then cited some of the recent strides in dairying in Georgia. The first milk condensary in Georgia had just been completed in Moultrie, where all kinds of condensed milk are now being made. Sweet cream and milk are being shipped into Florida from several points in this state, which is a new development from last year.

By far the greatest factor in development of dairying in Georgia is the growth of the sour cream movement. Six months ago there was not a sour cream station in Georgia. Today there are more than a score and they are increasing daily. The cause of this increase is the establishing of churning creameries for this sour cream.



Several creameries are now in operation. The last one and probably one of the most complete in the state is that of the Belmont Dairy Company of Atlanta. Electrically driven machinery for the conversion of all grades of cream into finished butter is now in operation in the Belmont plant. Sour cream for churning purposes is arriving daily from all over the Atlanta section of the state. Mr. Zimmer, the owner, states that he has no trouble in disposing of his entire make to the local trade. Atlanta hotels are advertising the fact that they serve "Atlanta Maid" creamery butter. We predict that in two years Georgia will be producing all the butter she consumes.

Thus the rapid increase that has been made in the last six months in Georgia indicates the southward trend of dairying.

ICE CREAM CABINET OF QUALITY

Construction of Our "Zero Brick" Cabinet

STYLE No. 5

STYLE No. 4

An Important Part of Your Equipment

IT is to the advantage of any manufacturer to recognize the true importance of the ice cream cabinet and the necessity for employing only the kind which will afford perfect preservation of his product on an economical basis.

For many years, Grand Rapids Ice Cream Cabinets have demonstrated in actual service that they are the answer to the ice cream cabinet question. They are constructed with a thorough understanding of the qualities which a cabinet must have in order to effect ice conservation and withstand the action of the refrigerating agents.

Standardizing on Grand Rapids Ice Cream Cabinets is a step which leads to saving expense and promoting all around satisfaction.

Get Ready for the Minnesota Ice Cream Convention

The 1922 convention of the Minnesota State Association of Ice Cream Manufacturers will be held in the Hotel St. Paul, St. Paul, Minn., on January 20th, and it promises to be one of the biggest and best in the history of the state meetings. A record attendance is expected and every ice cream manufacturer in the state is invited, whether he belongs to the state association or not—we want him to come and get acquainted—we want him to enjoy also the benefits reaped by others who belong to the association. Let's get together and air our difficulties and problems, some other fellow can help us out; and let us tell the other fellow of some method whereby we have achieved success, and let him benefit by our suggestion. Success means co-operation and this is the place to exchange ideas and suggestions.

The Hotel St. Paul, which is to be the convention headquarters, is a beautiful new hotel of the most modern kind. Visitors will find quarters very comfortable and elegant there. Service is the watchword; the cuisine is excellent. Come out from the home town environment for a day in the big city and enjoy yourself—you will find the trip both profitable and pleasureable. The association is doing its utmost in planning entertainment for the many visitors and to make it a convention long to be remembered. So don't disappoint them by not coming—pack the old kit bag and show them you appreciate how they are trying to help you. Minnesota has always been deeply interested in all matters pertaining to this important industry of the manufacture of ice cream, and the conventions heretofore have always been loyally represented, thus showing appreciation for the efforts which a convention entails. We hope that this year the representatives will be equally as loyal and show it by their full attendance. The headquarters for the ice cream convention is but a short distance from the depot and from tne heart of the shopping district—bring the ladies along and they will find it enjoyable, too.

Visitors will find St. Paul a congenial city. It is the Capitol City of Minnesota with a population of 250,000. It is called the "Gateway to the Northwest;" nine railroad systems enter the city and its location on ten automobile highways marks it headquarters for travelers. It is the home of the State Agricultural College. It is the chief distributor of merchandise consumed in its trade territory comprising the states of Minnesota, North Dakota, South Dakota, and portions of Wisconsin, Iowa, Nebraska and Upper Michigan. It is the manufacturing center of the northwest. The total value of manufactured products yearly is estimated at $215,000,000. St. Paul is pre-eminent along educational lines. Don't you think these facts are an inducement for you to come to the city to visit once in awhile? Now is the time—CONVENTION TIME—and any manufacturer who fails to join in the convention doings is negligent in protecting his own interests for we believe that these meetings should not be passed up as they are both entertaining and educational.

Every ice cream manufacturer in the state, no matter whether his business is done on a small or large scale, should join the state association, as through this association the manufacturer's profitable future can be safeguarded. Co come to St. Paul and get acquainted with the organization and if you do not already belong, JOIN and you will be warmly welcomed and benefited by this association.

Visit the State Capitol in St. Paul. You will find it interesting and worth-while. The building rises majestically on a height of land on the north edge of the city overlooking the down town business district. Cass Gilbert, the famous architect, supervised the building which was erected at an expense of $4,500,000. Guides conduct parties through the building at regular intervals. Mural paintings throughout the building make the trip worth while. The Minnesota Historical Society building is located opposite the State Capitol.

Fellow members, and others ,we want each and every one of you to realize the value of this annual convention for your own progress and the progress of the industry of ice cream making. The better you serve the more you will profit and the only way to learn how to serve better ice cream is by attending the conventions regularly and keeping up with the times. Do not remain home and keep your ideas and difficulties to yourself—come to the conventions and give the other fellow the benefit of your ideas and air your difficulties as well and as a reward for your co-operation, you will be benefited. These conventions are absolutely vital and necessary to your progress; your business needs your attendance at the convention and at the same time you can benefit by getting away from the routine life at home and make a little vacation of the trip. This is the best time of the year to get a new lease on life and start out right—so don't disappoint us, we shall look for YOU.

The new way—a child's play

Ice Cream Pails in New and Attractive Design

Our Ice Cream Pails are made from the very best stock obtainable, highly sanitary, and printed with new and snappy designs in one or two colors.

THE WOLF HOUNDS DO THEMSELVES PROUD.

Visitors to the Oklahoma City convention of the Oklahoma Association of Ice Cream Manufacturers were loud in their praises for the entertainment provided by the Wolf Hounds. There was something doing all the time to enliven the proceedings from Monday morning until Wednesday noon. They didn't stop at giving the ice cream manufacturers one entertainment. They gave a series of entertainments and they didn't forget the ladies.

On Monday they provided a luncheon and matinee theater party for the ladies and in the evening both ladies and gentlemen were invited to another theater party. On Tuesday the ladies were entertained by a luncheon and banquet and an auto ride. In the evening they were invited to join the men for an entertainment after the latter had enjoyed a "dutch lunch." Following the entertainment all concerned tripped the light fantastic toe until the wee' sma' hours.

On Wednesday the ladies were conducted on a shopping tour and at noon all joined for a banquet luncheon.

The entertainment program on Tuesday evening, following the "dutch lunch for men only" deserves special mention. The numbers were all good, but the real "hits" were the Metropolitan Quartet and Miss Dainty Dorothy Adrian with her dancing and singing. The quartet, consisting of Mrs. Nellie Gothold, soprano; Mrs. Helen Heed Brown, contralto; Mr. Horato Reuch, tenor, and Mr. Clark Snell, baritone, accompanied by Miss Lillian Deehman, pianist, delighted the audience with their songs and were called back again and again before allowed to quit. Their rendition of an arrangement from "Sextet From Lucia" stamped them as real artists.

Little Miss Dainty Dorothy Adrian was sweet enough to chew. Now don't get excited, we are merely reporting a unanimous verdict instead of registering our personal opinion. She is but 10 years old and pretty as a picture. She danced with the grace and finish of a professional yet with the sweetness of a child. Her singing adds to her charm and she, too, was kept real busy responding to encores. She was accompanied by her mother, Mrs. Clara Adrian, of Los Angeles, who is Miss Dorothy's manager in all things.

The dance following the entertainment was a most enjoyable affair and everybody went to bed feeling that it was the end of a perfect day.

Mr. C. R. Hank, who served as president of the Wolf Hounds in 1921, was also chairman of the entertainment committee and is entitled to a lot of the credit for the success of the entertainment features. He worked his head nearly off, but he can enjoy the satisfaction of a duty well performed.

At the annual meeting held on Wednesday the following officers for 1922 were elected:

President—J. Will Carpenter, care Haines-Carpenter Dairy Products Co., St. Louis, Mo.

Vice-President—C. H. De Roche, Liquid Carbonate Co., Dallas, Texas.

Secretary-Treasurer—Otis B. Witte, N. A. Kennedy Supply Co., Oklahoma City, Okla.

Kennel Keeper—Carl R. Zimmer, Menasha Printing & Carton Company, Kansas City, Mo.

It will be noted that the members rewarded their efficient secretary, Mr. C. H. De Roche, by electing him vice-president, and they probably have other honors in view for him. The Wolf Hounds are well started for 1922.

* * *

FROM THE PRESIDENT.

Oklahoma City, Jan. 5, 1922.

Editor Ice Cream Review:

I want to take this opportunity to thank all the boys who helped make the Oklahoma City meeting such a big success. The Wolf Hounds have a big reputation to line up to and it is a big job to entertain those wide awake ice cream men in the way they are used to. As chairman of the Wolf Hounds' entertainment committee I had **some job,** but now that it is all over and I have caught up on sleep, I realize more than ever what a task I had. I never could have lived through it except for the wonderful support I got from the whole pack of Wolf Hounds.

They are the best in the world and I hope that each one had the best Christmas he ever had. I also hope that he will do more business in 1922 than he is looking for, and I realize that will be going some. Now let us all get behind the new president of the Wolf Hounds and help him put things over big. Mr. President, we are with you to a man. Let's go!

C. R. HAUK, Ex-President,
Oklahoma Wolf Hounds.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review.

EXPANDING CONSUMPTION.

From an elaborate study of the sugar situation the Trade Service of the Standard Statistics Company reaches the conclusion that an extended period of activity and prosperity lies immediately ahead of the sugar industry, states Facts About Sugar. This conclusion is based upon a number of observations, but chiefly upon the fact, which the investigator finds to be demonstrated by a study of sugar market history, that "the demand for sugar is highly responsive to changes in prices and capable of great increase in the quantity demanded, both extensively and intensively, if the price be moderate." Foreseeing a very moderate price level for sugar during the next few years the report anticipates a heavy growth in consumption.

Above a certain price sugar, except in very limited quantities, is regarded as a luxury and is purchased sparingly by a large part of the populace. With every decrease in price they indulge themselves more and more liberally. Consumption is encouraged much more by a decline from six to five cents a pound than it is, for example, by a fall from twenty to fifteen cents. In the opinion of the trade expert referred to sugar is now in a price zone which will lead to a much larger consumption.

A VERY PRACTICAL CALENDAR.

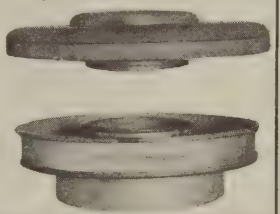
We acknowledge receipt of a very practical calendar from The Hudson Manufacturing Co., 119-121 North Union Ave., Chicago, importers and manufacturers of vanilla products, essential oils, etc. It is not one of those little stingy affairs. It is as big as the wife's Christmas shopping list and with figures that even a weary editor can see clear across the office. It is our idea of a serviceable calendar.

Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Icless Express Container.



What Would it Save for You?

Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover { Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical way in which they help to develop business.

WASHINGTON — MAINE

News From Far and Near

CALIFORNIA — FLORIDA

Glendale, Cal.—The Glendale Ice Cream Co. has incorporated for $25,000. W. S., E. G. and Edw. L. Herring are interested parties.

Los Angeles, Cal.—An ice cream manufacturing concern to erect a model plant has been organized. It has been announced by the president, Will E. Keller, head of the Globe Grain and Milling Company. The name will be the Globe Ice Cream Company. A $400,000 plant will be erected, with a 12,000 daily capacity. The vice-president and general manager is Mr. Comey; the treasurer, Mr. Hellman, and the secretary is J. M. O'Brien. Directors of the company are W. E. Keller, A. A. Comey, Marco H. Hellman, C. A. Fellows and Carl Leonardt.

Santa Barbara, Cal.—The Danish Creamery and Ice Cream Co. filed a certificate for partnership. Alfred Jensen and Peter Peterson are the proprietors.

New Haven, Conn.—M. Pucklin, Morris Tanenbaum, G. B. Hall, I. Goldblatt, A. Linkenbach, M. B. Hubbel, J. Johnson, Jos. and M. Tannenbaum are forming a new company, called the Manor Farm Ice Cream Company. They have incorporated for $25,000.

Dover, Del.—The New Era Ice Cream Process Corporation has been formed for $250,000.

Augusta, Ga.—The American Ice Cream Co. has been purchased by the Georgia-Carolina Ice Cream Co.

Moultrie, Ga.—The Moultrie Ice and Cold Storage Company will build a large ice cream plant,

Creston, Ia.—The Bloomer Cold Storage Co. purchased the Douglas Ice Cream Co.

Independence, Ia.—The Sanitary Ice Cream Co. is to erect a $40,000 plant.

Keokuk, Ia.—The Keokuk Ice Cream Company has incorporated. J. W. Peter is president; B. K. Peter is vice-president; M. M. Richardson is second vice-president; H. R. Elting is secretary, and F. E. Elting is treasurer and general manager of the new company.

Oxford Junction, Ia.—The Hutchinson Ice Cream Company of Cedar Rapids, Ia., has purchased the Iowa Creamery of Oxford Junction. Under the new management ice cream only will be manufactured, butter manufacturing will be discontinued. E. T. Barker, the former manager, has been retained.

Oxford Junction, Ia.—The Iowa Creamery Company will no longer manufacture butter; the plant has been sold to the Hutchison Ice Cream Company of Cedar Rapids, Ia. Nothing but ice cream will be manufactured in the plant hereafter.

Waterloo, Ia.—The Crowell Company has incorporated; it is successor to the Waterloo Ice Cream Company formed about nine years ago and which has had a rapid growth in business. The capitalization is $200,000 and business will be started when $50,000 has been subscribed. The officers are Roger I. Crowell, president; D. I. Glasson, vice-president; and E. C. Glasson, secretary-treasurer.

Chicago, Ill.—The Republic Power Co. has been formed in Dallas, Texas, for $10,000,000. They will operate ice cream plants. A plant is now being established in Chicago.

Chicago, Ill.—The Lamprake Ice Cream Company has incorporated for $50,000. Ice Cream will be manufactured. Donald R. Bryant, Thos. Lamprake and Jas. Perrie are interested parties.

Rockford, Ill.—The Allen Ice Cream Company is increasing the capacity of its plant. A two-story building is being erected.

Rockford, Ill.—The Cherry Valley Creamery Co. is preparing to manufacture ice cream. Operations will be begun next spring.

Streator, Ill.—There will be a new ice cream factory in Streator, M. C. Coppins, who is in the ice cream business at Wenona, Ill., will be the proprietor.

Marion, Ind.—The Amboy Creamery Company will replenish its line of extracts, gelatines and fruits.

New Castle, Ind.—A power milk bottle washer will soon be added to the Jersey Creamery Company's equipment.

Kansas City, Kan.—Atwood Ice Cream Company will erect a factory building at the cost of $8,000.

Manhattan, Kansas.—W. H. Chappel, who has purchased the equipment of the O-Keh Creamery Company is having a new ice cream factory erected.

Pittsburg, Kans.—The Pittsburg Candy Company is contemplating adding an ice cream department to the candy factory.

Conneaut, O.—Delivery equipment is very likely to be added to the Conneaut Dairy Company.

Galion, Ohio.—E. H. Weed will operate an ice cream plant.

Hamilton, O.—A new ice cream plant is being built by the Frechtling Dairy Company. New equipment will be purchased.

Salem, O.—The Salem Sanitary Milk Company will have a new plant in the spring.

Zanesville, O.—The Crane-Ohio Ice Cream Company has begun work on its new factory.

Anadarko, Okla.—The former owner of the Jersey Ice Cream Company, T. L. Whittaker of Birmingham, Ala., will open an ice cream plant in Anadarko and a full line of equipment will be purchased.

Okmulgee, Okla.—E. L. Lindsey will build an ice cream factory.

Brooklyn, N. Y.—The Philadelphia Ice Cream Company has incorporated for $10,000. Geo. Fust, Edw. J. Reidel, and Lina Kruse are interested in the project.

Newark, N. J.—The Robbins Ice Cream Co. expect to have their new plant in operation by the middle of January.

Boston, Mass.—Paul Baer, proprietor of the Polar Bear Ice Cream Co., will improve and enlarge his plant.

North Adams, Mass.—The Country Maid Ice Cream Company will erect a new plant. C. H. Mausert & Son are the owners.

Hagerstown, Md.—The Sine Ice Cream Company, capitalized at $500,000 with factory and headquarters in Hagerstown, has sold out to the Imperial Ice Cream Company, capitalized at $2,000,000, operating seventeen plants in Maryland, Pennsylvania, Virginia, West Virginia, Ohio and Kentucky.

Detroit, Mich.—The Freeman Dairy Company broke ground for the erection of an ice cream plant. Building and equipment will cost $25,000.

Sauk Center, Minn.—The Pioneer Ice Cream Company has been incorporated by four persons at $10,000.

Neosho, Mo.—A new ice cream plant will be established here at once. Negotiations between the milk and cream producers of Neosho and the Quality Ice Cream Company of Tulsa, Okla., have been successful. W. G. Russell is interested.

Bradford, Pa.—A new industry will soon be added to Bradford; it is to be the Bradford Ice Cream Company, and

SOUTHERN TINNING COMPANY
Johnson City — Tennessee
RETINNERS

We solicit your correspondence and business on the basis of PROMPT SERVICE, BEST OF WORKMANSHIP AND MATERIAL, REASONABLE CHARGES AND THE SAVING WE CAN MAKE FOR YOU. We will gladly retin a sample can for you, free.

"WE MAKE NEW ONES OUT OF OLD ONES"

the plant will be large and modern, 84x47 ft. and one and one-half story in height. Daniel L. Gaffney, of Pittsburgh, treasurer, is in general charge of arrangements for the new plant. They expect to be in operation about March 15th, with a complete equipment of modern machinery. R. C. Hutchison, Pittsburgh, is president; Fred C. Klussman, Pittsburgh, is vice-president; A. J. Lyon, of Angola, Ind., is secretary; and Daniel L. Gaffney, of Pittsburgh, is treasurer and manager.

Brookville, Pa.—The Brookville Ice Co. is building a large ice cream plant.

Erie, Pa.—Refrigerator truck bodies will be purchased for the Erie Pure Milk Company by Mr. Gordon Spencer.

Hazelton, Pa.—The Wilkes Barre and Scranton firm of Smith & Clark will erect another ice cream factory, to be located in Hazelton.

Kingston, Pa.—A new ice cream plant has just been completed by M. F. Fadden and Sons.

Waynesboro, Pa.—L. M. Greenwalt will build an ice cream factory.

Corsicana, Tex.—The Frick ice Cream Company has increased the capital stock from $15,000 to $40,000.

Chattanooga, Tenn.—The Clover Leaf Company has sold its ice cream plant to the Wise Creamery Company. They are enlarging the plant.

Dallas, Tex.—The Sunbeam Ice Cream Company is now in operation. A. Marshall is president.

Lubbock, Tex.—The Texas Utilities Company, of Plainview, will erect a $30,000 ice cream plant in Lubbock and will also enlarge their Plainview building. J. B. Scott is the manager of the company.

Covington, Va.—The Clifton Forge Ice & Bottling Works will erect a building for an ice cream factory.

Staunton, Va.—The Imperial Ice Cream Co. will build a branch plant in Staunton. The main plant is in Clarksburg, W. Va. The company is also building a plant in Winchester, Virginia.

Clarksburg, W. Va.—The Ken-Kone Company has incorporated for $10,000. Incorporators are Frank Mantell, John J. Brady, Frank Sweeken, and Geo. May, all of Connellsville, Pa., and Rollo J. Conley, of Fairmont.

Morgantown, W. Va.—The Morgantown Ice Company has obtained a permit for the construction of a large ice cream manufacturing plant which will be leased to a manufacturer.

Beaver Dam, Wis.—Bartelt Bros., proprietors of the Beaver Ice Cream Company, located at Beaver Dam Junction, have purchased ground in Beaver Dam and will erect a new ice cream plant. Messrs. E. and A. Bartelt are the proprietors.

Burlington, Wis.—The Kellogg Ice Cream Company are building an addition to its factory which will give the plant an output of 2500 gallons a day. It will be two stories high and the new portion will be for hardening and storage. A 20-ton compressor will be installed.

Seattle, Wash.—The Velvet Ice Cream Company has incorporated for $150,000.

CHAINOLENE MFG. COMPANY
564 W. Randolph St. Chicago, Ill.

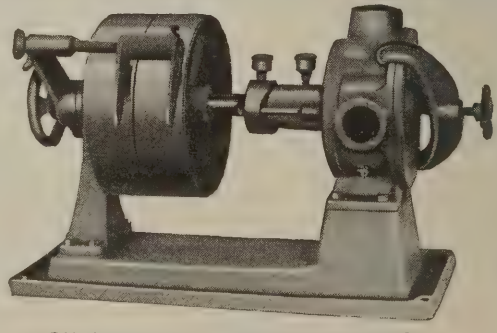
WHIRLWIND AUTOMATIC BRICK MAKER.

The C. E. Rogers Manufacturing Company, of Detroit, Mich., are putting out a whirlwind ice cream brick machine which makes 1,200 perfect bricks per hour.

The machine was demonstrated each morning during the Buffalo, N. Y., show and drew interested crowds of as high as 200 spectators in one running at the Wheat's Ice Cream Company plant. At the Minneapolis convention of the National Association of Ice Cream Manufacturers and at the Seattle convention of the Pacific Ice Cream Manufacturers' Association, this Rogers rotary brick machine attracted its share of attention.

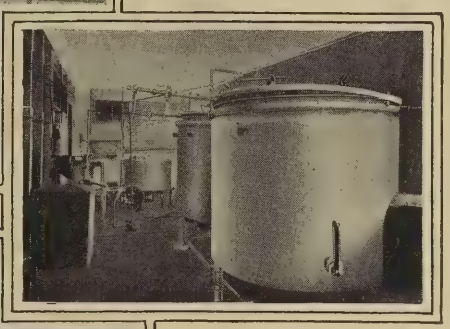
Rogers' Automatic Ice Cream Brick Maker at Work in Seattle, Wash.

The accompanying illustration shows a demonstration of the ice cream brick maker at the plant of the Seattle Ice Cream Company and the manufacturers present had an opportunity to observe the efficiency of the whirlwind machine which turned out the perfect bricks at the rate of 1,200 per hour. The machine was marvelled at for its simplicity and efficiency. The brick maker fills brick cartons in one, two or three colors in quarts, pints or in quarts divided into eight individual packages, at the rate of four gallons per minute. The cartons are fed into one end of the machine and the ice cream at the top, and the bricks come out perfectly filled, with their colors accurately laid and ready for the hardening room. The capacity of the machine is from 1,200 to 1,800 Neapolitan or solid-flavor bricks per hour. The Neapolitan bricks are mechanically and accurately proportioned, the dividing lines between flavors being sharp and straight. With a special conveyor the filled boxes are carried directly to the hardening rooms at the same speed of the machine. The amount of labor saved is remarkable. Two people can operate the machine. One feeds the empty boxes into the machine and another closes them as they pass by on the way to the hardening rooms. Paraffined cartons do away with extra wrapping. The cartons carry the brand name and other printed matter and when the package is opened by the consumer the cover is removed, the ends are detached and all sides are turned down, leaving a perfect brick, ready for cutting.



Mr. Don Rogers of the Rogers Manufacturing Company, and Mr. Forrest Harwood of the John W. Ladd Company, Detroit, Mich., were in charge of the Seattle exhibit.

A BEAUTIFUL SOUVENIR.



One of the nicest and most practical holiday souvenirs that have come to our desk is the one issued by the Purity Ice Cream Co., Russellville, Arkansas. It is a document for filing valuable papers, carrying the name and address of the recipient and with the "compliments of" the donor. It is a very attractive, useful article for the office man or for the traveler.

PASTEURIZE IN GLASS.

We have issued two new booklets which we want to send to you. One describes our ice cream mixer, pasteurizer, aging tank, etc. the other, our milk and cream pasteurizers. Mark the one desired on coupon, and mail.

In 1900 there was practically no pasteurization of milk, cream, ice cream mix, etc., as we know it. Today ninety-one per cent of the milk and a large percentage of other dairy products in America are pasteurized. This is a distinct step forward.

Within the last few years many dairy and ice cream concerns have adopted the **Pfaudler** system of pasteurization in glass,—which is the modern method.

Our ice cream pasteurizer and mixer does double duty, the one tank being used both for pasteurizing and mixing. May we tell you about it?

Back of the Best Ice Cream, Toppings and Marshmallows

Good ingredients mean good products. Good products mean big sales. Among gelatines there is none purer or superior to

Ucopco Pure Food Gelatine

In ice creams, it efficiently and uniformly distributes both moisture and flavor, insuring smooth, velvety texture, free from ice and milk-sugar crystals.

In marshmallow work, its uniformity and high quality insures a product unexcelled for fluffy tenderness and long retention of flavor.

There's a grade for every purpose. Ask for details.

"UCOPCO" Comes Sealed in Red Drums

THE NORTH CAROLINA LOVING CUP.

The above cup was presented by the North Carolina Ice Cream Manufacturers' Association to the state having the largest delegation at the Southern Ice Cream Manufacturers' Convention, held at Atlanta, Georgia.

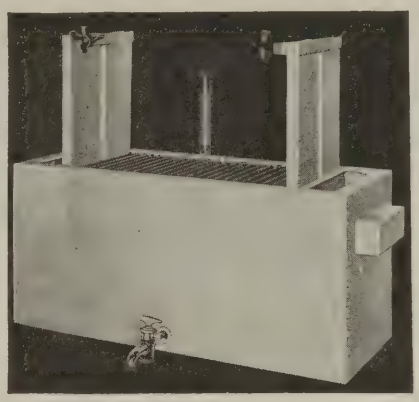
It was a great masterpiece of workmanship and required the physical strength of Messrs. Mulligan and Abel, a well chosen team of the Dixie Flyers, to hold this masterpiece between themselves at heads height while Mr. George L. H. White, president of the North

Admirers of the Loving Cup.

Carolina Ice Cream Manufacturers' Association gave the following presentation speech:

"Realizing my inability to make a lengthy speech and knowing that actions speak louder than words, I am simply going to present this cup in behalf of the North Carolina delegation.

"You will notice from its size that this cup is large enough to speak for itself and were it gifted with the power of speech, it would say, 'I Scream' (Ice Cream) in a loud voice the most cordial greetings from the old North State.



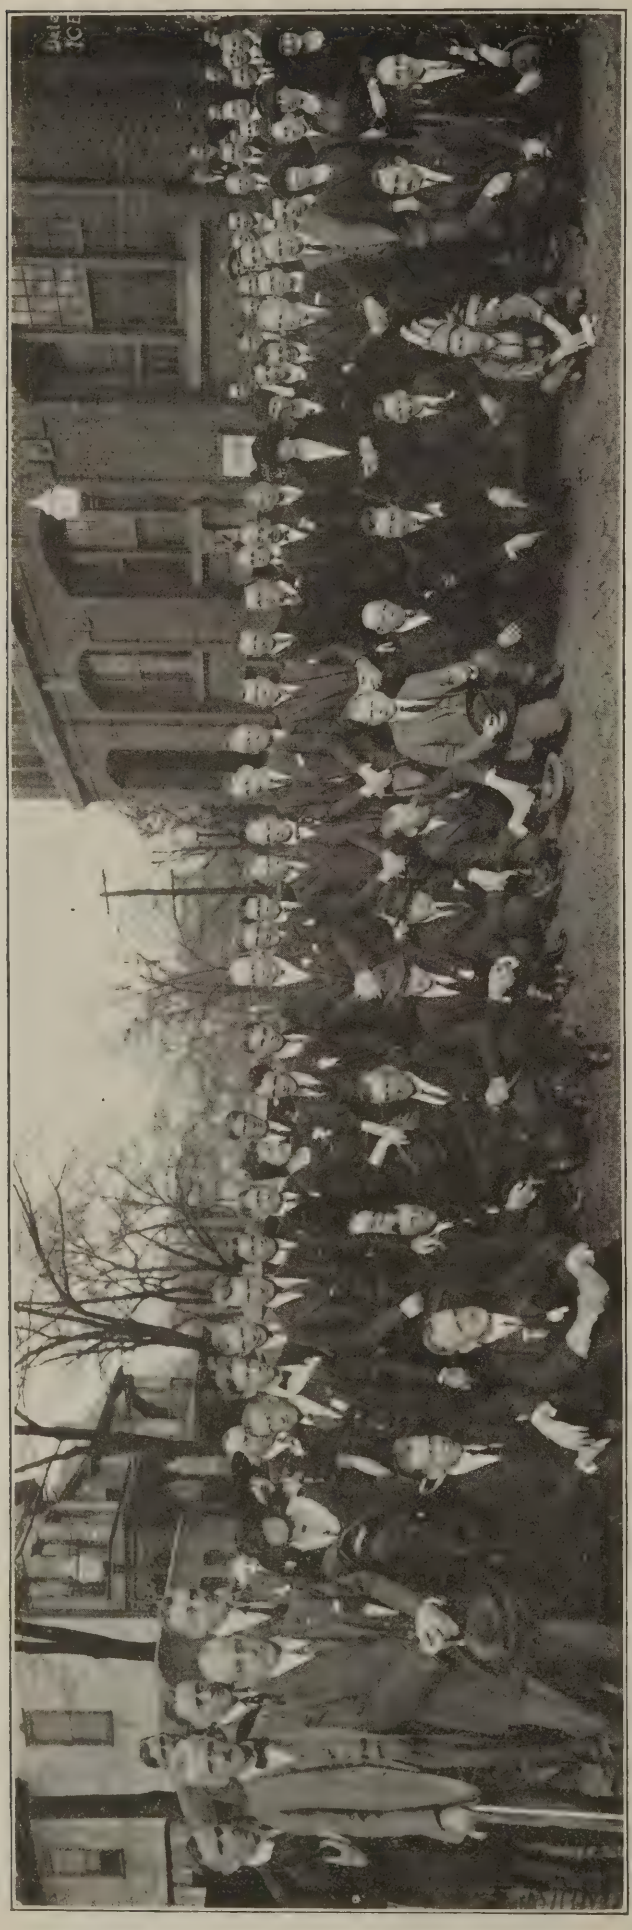
"Most of you have heard of that memorable conversation that took place between the governor of North Carolina and the governor of South Carolina away back yonder in the days of the old South, that expression of good fellowship, 'It's a long time between drinks' has been echoed around the world. Of course, the sentiment conveyed by that expression was 'It's a long time between visits' and if this cup could speak it would say in behalf of the North Carolina delegation, 'We hope it will not be long before the old North State will have the pleasure of entertaining this convention.'"

"It therefore gives me very great pleasure to present this cup to the State of Tennessee, for having the largest delegation at this convention, and if this cup were to give a toast, it would say,

'Here's to the land of the Long Leaf Pine,
The summer land where the sun doth shine,
Where the weak grow strong and the strong grow great,
Here's to Down Home in the Old North State.'"

Mr. White then with apparent ease presented this wonderful token to the Tennessee delegation as this state proved to have the largest attendance at the convention, and therefore, the lucky winner.

Mr. Sidebottom, of Tennessee, with a well chosen remark accepted the cup as a token and great honor and assured the North Carolina delegation as well as all ice cream manufacturers and all present that he and the Tennessee members would see to it that the cup will be well housed and properly used whenever the Tennessee members had the honor of entertaining the Southern Ice Cream Manufacturers' Convention in the state of Tennessee.



Reduce Your Sterilizing Costs the

Electro Chemical Way

WITH only salt, water, and electricity, the above cell will produce sodium hypochlorite in five minutes time, at a cost of a fraction of a cent per gallon at working strength. No cheaper or more effective disinfectant known. In diluted form it has reduced bacterial count from 7,000,000 to 800 in five minutes.

1922

May the coming year exceed in Happiness and Prosperity the most sanguine expectations of every reader of these lines.

H. KOHNSTAMM & CO.

Is your package easy to remember?

"Putting the name across" is never an easy job. People do not make it a point to remember your name when they see it. But if the package is so designed that it will arrest their attention, if it is striking—"different"—they will begin to remember it after seeing it the second or third time. And they will associate your name with your product.

Then, too, your package must deliver its contents in good condition. And only a house that has learned, through long experience how to build the best boxes can do both jobs well.

We have designed and made boxes for exacting organizations in every branch of business. For more than 20 years we have been improving the packing methods of business houses thruout the country.

Our service department will be glad to send samples and quote prices.

Ice Cream Output for 1921

By L. O. THAYER

	1921	1920	Decrease
Total output, U. S.—Gallons	216,569,212	257,820,490	41,251,278
Total wholesale factories	189,261,212	212,960,382	23,699,170
Total retail make	27,308,000	41,991,709	14,683,709
Wholesale price @ $1.14 a gallon	$215,757,781	*$278,716,101	$62,958,320
Retail value of total @ $2.24 a gallon	485,115,034	†638,384,815	153,269,781
Value, wholesale plants	192,714,375	164,578,000	‡28,136,375
Wages and salaries, wholesale	158,816,460	172,224,000	13,407,540

Total per cent decrease in output for 1921 compared with 1920—16.

*1920 price, $1.31 a gallon. †1920 retail price, $2.48 a gallon. ‡Increase.

There will be peculiar interest in this estimate of ice cream consumption for 1921 because of the fact that many wild and totally false guesses have been made by several speakers in recent conventions, and many concerns interested in selling supplies to the manufacturers have dwelt on the "wonderful" business done during the year with the evident idea of appearing optimistic. There can be no fault found with the optimistic, for we are all in that class. This estimate is designed to be one of cold, hard facts, and the figures this year have been as carefully collected and collated as has been the case for the last ten years. In fact, unusual care has been exercised in the gathering of statistics, for the writer knew it had been an unusual year.

L. O. THAYER

The country has been covered even more thoroughly than before, and the number of plants has been almost doubled for data which would check the usual representative plants which always have entered into the final calculations. It was thought wise to do this because of the effort on the part of many as far back as last September to make it appear that the year 1921 had been a record year for sales. Of course that month was far too early to gain any true statistics of the business for the twelve months. Even at that date the wild guesses were far wrong of the actual business done up to that time.

It is no easy task to cover the country, with its 4,700 plants which do a wholesale business, and get a true line on the output. For this estimate almost a quarter of the plants have reported, and as they were picked for their representativeness it is clear that the final estimate comes nearer being the true situation than any hit or miss generalization covering a portion of any one state.

There are certain representative men connected with associations who have a general idea pretty close to being accurate of the conditions in their section, and the word of these men goes a long ways toward checking up on the individual reports in their section. In this way large sections can be covered with more or less of authority. In some years these men have qualified their statements because of uncertainty in their information. Not so, for this review. Never have they been more positive in their assertions. It is true, also, that the individual reports have been clear and positive. They have in 80 per cent of the cases agreed with the general summary of the section reporting by key men.

No man of wide and general information has stated that 1921 saw as much ice cream put out as in 1920. The individual reports of a 100 per cent output have been cut down to about 5 per cent, and in these cases many have given an explanation in order that their statements could be believed. It was clear that there was some special reason why their output was as large as that of 1920. More manufacturers have been frank in their statements of loss of volume, and many have given the reasons for the loss. Their excuses have made their reports all the more believable.

There are several reasons for the loss of sales. First, and foremost is the holding up of retail prices long after the public refused to buy at the war figures. Nearly everywhere the retailers kept the same prices as in 1920, when everything was at the peak and the public had so much money it went crazy trying to spend it. The first break that presaged hard times came in October in New York. Within two months the public drew in its purse strings, and began to buy more carefully and to deny

itself luxuries. In spite of the fact that ice cream is a food, and in spite of the fact that manufacturers have been harping on this line for two years, the public in general has not yet fully agreed. It still classes ice cream with candy and soft drinks.

When the break came, and the far-seeing ones were expecting hard times, ice cream was being sold, as a rule, at from 75 and 90 cents a quart over a wide area of the land. A small dish and a sundae was 22 to 28 cents, with the tax. A soda was 17 cents and no cones were sold less than 11 cents. The writer saw the trend as early as November and waited for the new year to turn, to see if the retailers would take notice and follow the wholesalers in reducing. They did not, and in February a campaign was started to show the retailers that they could hold up sales and make more money if they would reduce prices.

The wholesalers saw the light and reductions were made all over the land, some of them as much as 15 to 20 per cent. It was expected that the retailers would pass this reduction on to the customers. When it was found that the profiteers would not listen to reason various methods were tried to make them change their policy. Some succeeded, but most of them did not. It was not until July that many retailers were compelled to come down, and then only because the newspapers began to show them up. By late July prices had come down to a fitting figure.

With the spring weather starting early, and with good prospects for a good early trade, the wholesalers were congratulating themselves. But they saw dwindling sales, and month after month they ran behind the volume of the previous year. Nearly all over the east and middle west the weather was favorable until August. But the retailers had done their damage, and the public had gotten out of the habit of buying. The weather was unfavorable as a year only on the Pacific coast, which ran behind sales as an average fully 30 per cent. This with the high retail prices is responsible for the sad showing there. There were the usual spotty places where the weather took its toll, but until August the conditions were average favorable. August was a tough month over a wide area of the choice ice cream section. One manufacturer, whose output runs around 2,000,000 gallons, said he had actually lost money in August, and he was getting $1.50 a gallon at that.

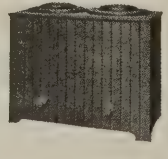
Of course, another great reason for the loss of volume was the hard times, which rolled clear across the country. With so many out of work and with uncertainty, families by the million had to figure ahead on buying, and ice cream was one of the things that could be dispensed with. The high prices had made the consumers ugly and it is figured that this spite alone is responsible for the 16 per cent loss that is recorded. In spite of the hard times, had retail prices been as they were in September, this would have been a record estimate.

A careful analysis of costs in every section of the land proved that the wholesale prices, ranging from $1.00 to $1.30 a gallon were reasonable and fair. In some sections the $1.40 price was not out of reason. Those who stuck to a higher price than this were not fair, and they suffered for their greed. The retail prices to meet these figures should not have been more than 45 to 60 cents a quart. Where bricks were sold these retail prices would provide more than a good profit; where bulk was sold they would have been ample.

Reports from sections proved interesting. New England averaged 78 per cent of 1920; the Atlantic coast states as far as Virginia went to 88; from there to Florida, 68; from Florida to the Mississippi, 69; the northern part of the south, 72; the middle west, east of the Mississippi, 92; the southwest, 70; the prairie states, 72; the mountain states, 70; Pacific coast, 70.

Had not the great ice cream section from the Atlantic to the Mississippi and north of the Mason & Dixon line, done as well as it did, the report would be sad indeed. The middle west really carried off the banner for 1921. As two-thirds of all the ice cream eaten is in the section mentioned it brought up the average.

Everywhere the retailers that make their own ice cream were hard hit in volume; they probably made a good thing at their prices, but just the same they have learned a good lesson. What wouldn't they have made if they had kept up the volume at 15 per cent less price? Of course, the item of retail make does not take into account the hotels, restaurants and the like, for no one can estimate this make. The item means those retail stores that sell their own make over the counter. There is 2,000,000 gallons of this in and around New York City, and the output should have been twice that.



Canada probably did almost as well last year as the preceding one. Ontario and Quebec had three wonderful months, the hottest long stretch known in history. Those who think they know say that Canada probably turned out about 38,000,000 gallons of U. S. size.

After all it is not the gallonage that counts; it's the net profit. Even at the wholesale prices the wholesalers faced favorable conditions except as to overhead charges. This applies only to the big ice cream section. Those unfortunates in the south, as a whole, the mountain and northern section of the Pacific coast had more obstacles with which to contend. They faced bad weather, or lack of spenders, or bad accounts. In spite of the set-back, these boys are not discouraged and are hardly blue over the result. If there is any discouragement it is

in the south, where conditions are sad indeed. Probably less than 50 laid by much money; perhaps 100 made a little, and 150 just got by. Several hundred are up against it. It was said at the Atlanta exhibit that as a whole the south never was so hard hit.

The year has taught a good lesson to all ice cream men. They will be more careful in buying in the future; they will seek to lower the overhead more than ever before; and they will spend as little for improvements as they possibly can. Those who have investigated say that those companies which are strong will seek to strengthen their position; that many small fellows will drop out, or sell out; that the monied concerns will add to their chains to advantage, and that there will not be a great amount of building, as we have been accustomed to see each winter.

There were a few bright spots in the business. The prices of ingredients were low and labor was much cheaper and a little more efficient. Delivery expense was cheaper, and the shipping radius was shortened, thus giving the little fellows a better chance than they have had for years. The high express rates and the shortening of truck delivery has caused many of the big concerns to work their own cities more intensively and let the country districts go hang. The valuation of plants increased, not because of added investment so much as added tax valuations. Taxes are still at the peak, which is bad all around. The little relief in war taxes will help this year. The rescinding of luxury taxes for this year will help some. The cone business ought to come back.

In spite of all the adverse conditions and a year that was not bright, it is noticed that many big concerns are going ahead with plans to enlarge their business. To get around the high cost of shipping branch plants are being put in to more closely cover their territory.

As a rule the larger concerns were fairly well satisfied with the profits for the year. Of course there were few such profits as marked the last two years, but most concerns were satisfied with fair profits and not so large that they will have to pay big super-income taxes. Large sums for new equipment, especially delivery, were spent in 1919 and 1920 to reduce the super tax. For 1921 the sums were smaller.

The wise ones are watching the trend of business. It is realized that in most big cities there is getting to be a jam; competition is at its peak. In some places the number of plants is too large for all to make a living, and the old-timers are tightening up to face the coming struggle. Many a city can be named where the fight will be fierce, and someone must give way. The plethora of plants makes competition so keen that unfair practices are creeping in and the old-timed bitterness is showing itself after an absence of many years. This is a bad feature that will mark this year.

It is getting to be a problem for a new comer to find a spot that is not covered all too well with ice cream plants. The coming struggle will be a battle of money and brains. The great influx of outside capital has not been calculated to steady the industry. In many cases these outsiders have had a hard row to hoe. Some are just hanging on to see what 1922 will bring forth; many are ready to quit. Those who are old established are watching for an opportunity to pick off the weak concerns and reduce competition. The states of New York,

At the Southern Exhibition in Atlanta.

Some Questions Worth Considering

Will you make all the ice you need for next summer, or are you going to have to buy ice in the rush season at top prices?

Is your power plant in shape to handle the work you expect to do?

Is your refrigerating equipment prepared to turn out next summer's production?

We advise with you on increasing the efficiency of your present plant, or will lay out a new and modern one for you.

Possibly you don't need a new plant—maybe we can make the old one do. Let us hear from you if you want to do better next season.

CROWN FRUIT & EXTRACT CO., Inc.

418-420 WEST BROADWAY

New York City, N. Y.

Pennsylvania, Ohio and Illinois, which sell half the ice cream of the country, are covered in every conceivable spot with ice cream plants and it is a gamble for anyone to start up in any spot.

For 1921 there was not so much money spent for candy and soft drinks as in the year before, and this fact worked out to the good of the ice cream business. Whether these more or less competitive articles will come back is a question to be answered after another twelve months have rolled around.

In all this keen competition one noteworthy has shone forth. The quality of ice cream made has been improved wonderfully. Never has as much really high grade ice cream been turned out as in last year. To increase sales money has been spent on the mix and more intensive sales work. The business is becoming more scientific every year in the older sections. It is realized that the pennies must be watched now where it used to be dollars. A difference of a quarter cent a gallon now represents a profit oftimes. Everyone is now thinking of going after business in the dull months, and there has been much discussion of how to make the plant pay for 8 to 10 months where several years ago no one expected it to make a profit for more than six months.

While many people declare that ice cream is in its infancy—more or less true to a certain degree—the bald fact faces the industry that the point of ice cream absorption by the public is being reached rapidly. For the past 8 years the increase in gallonage has been below 10 per cent yearly; where before that was almost a common experience. The greatly enlarged number of plants has not produced sales in proportion to their number. In fact, 10 years ago, 3,000 plants did within 25 per cent of the business that 4,700 did last year. In other words, an increase of 58 per cent in number did only 25 more gallonage.

To increase sales to the old percentage more intensive work will have to be done; families will have to be interested to use ice cream more for desserts; the fancy of the public will have to be attracted; schools must be covered better so that the daily diet will include this rare food. There is much to think over by the manufacturers this winter, and upon the result of this thinking depends the success of 1922.

ELYRIA ICE CREAM MEN DO BIG BUSINESS.

According to Elyria, Ohio, ice cream and soft drink dealers, last summer was the best in the history of the city. Two reasons are attributed to the big business: the unusually warm weather and prohibition.

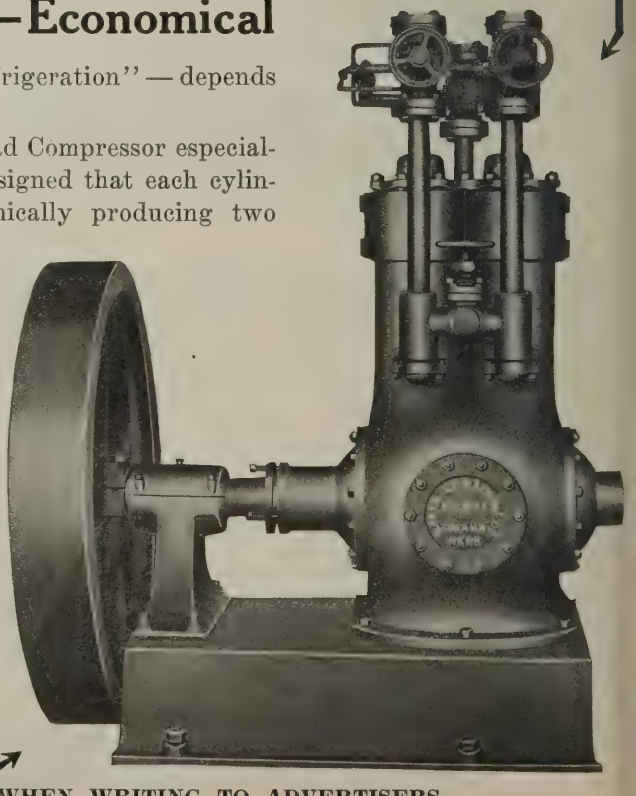
There was more buttermilk drank last summer than any corresponding period before.

"Prohibition has stimulated the soft drink business to a marked extent," said an Elyria dispenser and it has also increased the sale of candy," he continued.

"I have been in business here a great many years, and before the event of prohibition some men never entered my ice cream establishment but now scores of those who for years rested their feet upon the brass foot-rail now occupy a stool in front of the fountain or a chair in a booth in quenching their thirst with ice cream or one of the many kickless drinks we serve.

"We also have many men customers who were prone in the days gone by to eat sweets now buy candy regularly while some sip coffee as they did the cool steins when old J. Bar Lee Corn was most active through the land. As the country became dryer our business increases. 'It's an ill wind that blows no good,'" continued the dispenser of drinks without "sing" or "kick."

An Unusual Service



Efficient—Dependable—Economical

Upon the compressor—the "Heart of Mechanical Refrigeration"—depends the efficiency and economical operation of your plant.

The Baker Two Cylinder Special Double Suction Head Compressor especially meets the needs of the ice cream manufacturer. So designed that each cylinder can be operated at a different pressure, thus economically producing two temperatures with one machine.

The extremely cold temperatures of the hardening room is produced by one cylinder working at low pressure, while the more moderate temperatures are obtained with the other cylinder at higher pressure.

Baker refrigerating engineers have made an exhaustive study of the needs of the ice cream manufacturers. We can help solve your problem. Write us today.

ICE CREAM DEALERS IN SESSION AT WILKES BARRE.

The improvement in ice cream manufacturing conditions during the last few years was discussed by Prof. Fisk, of Cornell University, who was the principal speaker at the conference of the Central-East Ice Cream Association held in Wilkes Barre, Pa. Prof. Fisk also gave a detailed account of the manufacture of ice cream today compared with the methods in use before the recent inventions.

What scientific research has done towards the removal of crystals in ice cream was the subject discussed by Thomas Hall, vice-president of the Russ Ice Cream Company. He said that wonderful progress had been made and that within a short time, the manufacture of ice cream entirely free from these rough spots would be possible.

At the brief business session preceding the addresses, officers were nominated. The next conference of the association will be held at York.

On the previous evening the manufacturers and their wives enjoyed a banquet in the Sterling.—Wilkes Barre (Pa.) News.

ONE of the Nordhem "Big 6" ice cream posters.—full-color miniatures of the entire series will be sent on your request.

Advertising and Selling Service for Ice Cream Manufacturers

8 West 40th Street New York City

Common Sense in Ice Cream Advertising

Address of A. R. FERNALD, of the Fredrick C. Mathews Co., Detroit, before the Sixth Annual Convention of Pacific Ice Cream Manufacturers' Association, Nov. 14-16, 1921

I do not believe that you gentlemen are here to make a general study of advertising nor that you will be interested in a discussion of advertising if it is to cover merely fundamental principles generally applied and consisting of generalities.

A. R. FERNALD

For this reason I prefer to take up the specific application of advertising to your own business and problems. I will mention the faults where I see them and I believe you gentlemen are big enough and broad minded enough to apply only those things which apply in your particular case and if you can make use of them we shall feel well repaid.

First let me say that it is high time some ice cream manufacturers ceased looking upon advertising merely as something you are expected to do and from which the results are uncertain and impossible to definitely trace.

Weak advertising in all lines of trade has for time immemorial fallen back on the excuse that advertising is so general in character that results cannot be checked.. If this **were** true, the only assurance you have that you are wisely investing your money is that certain forms of advertising are recognized as good mediums of expression and must consequently be right. I contend that there are certain forms of advertising the results of which are so definitely traceable that there is no necessity for taking this chance.

If I were asked to criticize the outstanding fault in ice cream advertising the country over I would say that your greatest fault is lack of plan.

Fundamentally, plan in any advertising movement is of basic importance and plan should be given at least an even break, and in the majority of your businesses I don't think you have done that.

There are seven things, any or all of which have a chance to lessen or defeat the effectiveness of your advertising.

These seven are:

(a) Lack of Order in Fixing Appropriation: The average advertising appropriation is not an appropriation at all but rather consists of sums of money wrenched from the business at irregular intervals, dependent very often on the whim of the owner or owners rather than an analysis of the need.

Oddly enough it is also true that this money is usually easiest to get when business is good and the advertising is least needed. Such a program makes a **plan** of expenditure impossible, promotes waste and brings about hurried decisions resulting in many errors of judgment.

(b) Lack of Continuity in Plan and Materials: The "catch as catch can" method of appropriation results not only in a lack of plan but also in a lack of continuity in the materials or advertising text used to carry out a campaign.

Miscellaneous material is purchased, expenditures are made in things that have no general connection with your campaign.

Under these circumstances it is rarely possible to get full value from the yearly expenditures.

(c) Lack of Regularity in Plan and Use: Perhaps the greatest drawback in irregularity of plan is the fact that your advertising is almost always intermittent. Instead of the long pull, the secret of most successful advertising, you advertise jerkily. Your heaviest expenditure invariably falls in the Summer season, and the Fall and Winter season, when gallonage is most needed, is neglected and has no opportunity for development.

(d) Neglect of Opportunities Offered in Use of Properly Prepared Mailing List: It is only in the past year or two that some of you have been awakened to the fact that your most fertile field for advertising lies in intensive mailing lists in which groups of consumers can be influenced to regard your product most favorably and through reminders, educated to use it more frequently than has been their custom. The advantage of being able to direct an advertising force to concentrate on one group or section is so obvious that it requires no defense. I have personally studied and practiced the principles of direct advertising for the past fifteen years and am thoroughly sold on it both because of its flexibility, the privacy of the method, and the fact that you can actually check the results. Now the first question you are apt to raise is, "Will it work in the ice cream business?" I am here to say that it will and does. To the end that I could bring you proof of this in connection with the development of winter gallonage I sent out telegrams about two weeks ago to makers who were using direct advertising methods in cities varying in size from the second largest in the country to towns of twenty-five, fifty and one hundred thousand population.

Here are a few samples of their replies:

"We think the direct by mail plan of advertising ice cream in the winter months is one of the best methods of stimulating business for this season of the year."

"Regarding winter mail campaigns used last winter. Well pleased with results. Many requests for additional copies from friends of those to whom campaign was mailed. Believe campaign creates interest during winter months and holds business up where ordinarily drops off. Well worth cost. We stand back of our belief by re-ordering."

"Mail campaign is winner; one of strongest connecting links possible in advertising and sale of ice cream. Results entirely satisfactory."

"Consider direct method best means influencing housewife to use ice cream in home. Well pleased and will continue this year."

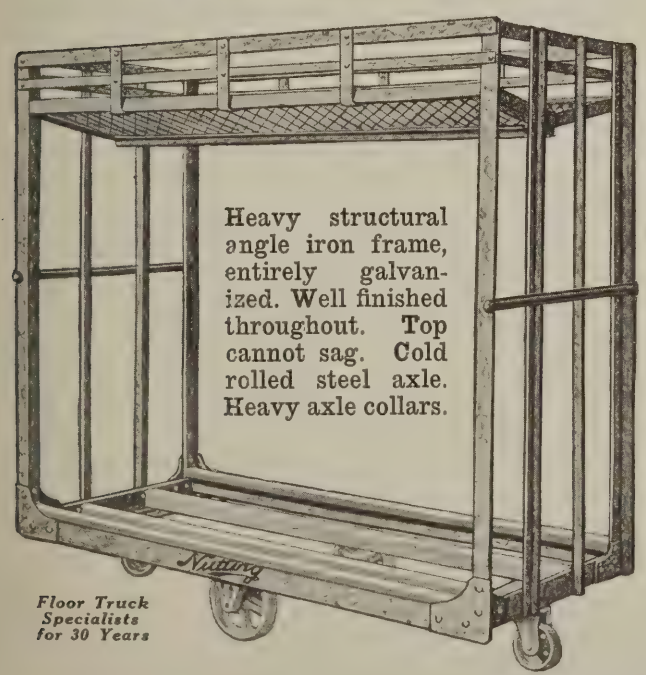
"Without a doubt best medium to reach housewife. Wonderful results last season. Increased fully 50 per cent and will use again this season. Certain of results."

"Have used campaign and would advise any one interested to get busy on mail plans. Figure have increased our business 100 per cent."

I am not quoting these as a boost for our own business but to bring forcefully to your attention a heretofore neglected field of ice cream advertising that holds vision and forethought to use it.

(e) Waste in Distribution of Advertising Matter: A great deal has been said about waste on advertising

Custards *Flavors*



Maraschino Cherry Custard
Mothers Egg Custard

"Acme" Custards	An exact reproduction of the EGG or CHERRY.

How to Lower Your Costs of Handling Ice Cream Cans

Floor Truck Specialists for 30 Years

DIRTY cans are piled with open end out, which slants them upward and prevents slop from spilling. After washing they are piled up with open end in to drain quickly. All the covers are put on top, held in by the rail.
With this specially designed truck your moving, storing and counting of cans is reduced to a simple, easy job.

Nutting

Ice Cream Can Trucks

Ball bearing swivel casters and wide, 8¼ inch main wheels insure easy rolling with the heaviest loads.

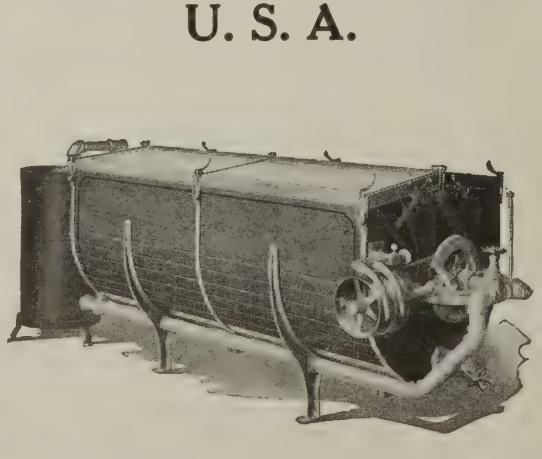
Holding Temperature!



Many users of the Manning Batch Mixer have commented on the fact that the Manning has great holding properties. There's a reason for this. The entire body, including the covers, is insulated with 1-inch lino-felt. Between the lino-felt and the inside copper pan a single thickness of waterproof paper adds greatly to the insulation and completely prevents sweating.

Careful attention to similar details makes the Manning the most perfectly built vat on the market today.

MANNING EQUIPMENT

MANNING MANUFACTURING COMPANY

Rutland Vermont U. S. A.

Perfect In Workmanship!

materials and no doubt much of what has been said is true.

After all, if you will regard the matter reasonably, have you ever considered that this is largely your own fault?

These abuses have been brought about by your own carelessness and neglect and you are reaping a perfectly natural result. If you have no plan for distribution, you can depend upon it there will always be waste and plenty of it.

Another point I want you to consider is the fact that there are certain limits to the life of any piece of advertising display material and you are perhaps expecting too much in the way of continuous display from it. Suppose I were to pay eight or nine thousand dollars for a single page of advertisement in a certain popular weekly magazine. Would I expect every one who secured a copy to carry it about in their coat pocket month after month simply because my advertisement was in it? I couldn't expect that.

(f) Lack of Interest in Developing Dealers: I believe too little interest is taken in the development of your present dealers. You cannot extend this interest if you know the dealer only as a name. If I were an ice cream manufacturer I should have a complete record of my customers as a part of my permanent files. I would kno whow many had fountains, those that were open to that development; the extent of their bulk or carrying trade; what advertising was suited to the individual dealer and all of the things that would give me a clear office picture of my field.

Most of the largest operators have the information, but you should **all** have it summed up in a clear, logical manner, and it is just as important for the smaller operator whose business is to grow as it is for the larger ones.

(g) Lack of Interest on the Part of Your Wholesale Men: I do not know just how much you expect from your wholesale men but I do know that if it were my business and my wholesale man was not a man with a vision of the possibilities of the business, I should fire him and get a new one.

On the other hand, I think that lack of development on the part of the wholesale man is often the fault of an employer who lacks vision himself.

I have seen some fine material in wholesale men whose lack of development rested entirely on either the lack of energy or enthusiasm on the part of the employer himself.

Another point—see that your wholesale man not only understands your advertising plan, but that he is thoroughly sold on it himself. Make him a part of it because it is one of the things he has to sell and his enthusiasm and belief in it will contribute largely to its success and economical use.

Now let us check these one at a time, take them apart and examine them and see whether they are curable and if you agree that they are, let's go ahead and cure them.

Now let us substitute seven new cardinal points for constructive building to influence our new policy.

I should say that to be successful in your advertising and sales effort you should:

First—Fix the appropriation in relation to your gross business.

Second—Lay out a definite plan.

Third—Make a single office analysis of your dealers' situation.

Fourth—Make an accurate study of your competitor's field.

Fifth—Educate your wholesale man to merchandising possibilities.

Sixth—Compile strong mailing lists, for mail helps.

Seventh—Properly select and distribute your advertising material.

(a) Fixing the Appropriation in Relation to Your Gross Business: Out of the millions of dollars that are being spent annually to advertise the ice cream business there are bound to come definite figures as to the proper amount that should be invested by you to assure a continuance of your present trade, as well as developing new markets.

There are occasional conditions that either raise or lower the volume of expenditure, such as chronically good or bad seasons, the absence or the presence of spirited competition and these must of course be dealt with individually just as one would deal separately with a business that was new and that might as a result expect to double its gallonage each year for the first few years until it had established its field.

In the main it is safe to base the ice cream manufacturers' appropriation on three to five per cent of the gross turnover.

(b) Laying Out a Definite Plan: Having determined the appropriation it is now up to you to give thought to a plan that will give you the best showing possible for the money expended.

Perhaps the most important part of such a plan is to see that your expenditures are so proportioned that you will be spending the proper proportion of your money in the months or seasons when the advertising is most needed. Do not have any lean months, for you will find almost invariably that they will have an exasperating way of bobbing up just when you have need of added effort.

The next point about your plan is to lay it out with a definiteness of purpose.

Know what you are going to say and say it steadily through the year. Associate some definite phrase to your advertising and have it a good one, for the public, through your continued advertising, is bound eventually to believe and recognize it. Adopt a style for your advertising. Have your advertising, your shipping packages, your stationery, follow this style without a break. That is why great care and thought should be given to the original of your style, because you are adopting it not for a season, but for the life of your business and you can afford to have it the best.

Every point of contact you have with your customers and with the public should express your individuality. Having selected a plan and being satisfied with the wisdom of your selection, do not depart from it.

Souvenir programs, novelties, special editions of newspapers and all their kindred are too often the "catch all" that greatly adds to your advertising cost without adding proportionately to your volume.

(c) Making a Simple Office Analysis of Your Dealer Situation: As I pointed out to you, it is important that this should not be merely a matter of knowledge on your part, but a matter of record, for it is only by putting it down in black and white with an accurate accounting of probable needs that the possibility of expansion and development can be gauged with any degree of accuracy. It is important, too, that this list be cultivated by mail as well as through salesman contact.

(d) An Accurate Study of Competitive Fields: While no doubt every manufacturer has a broad general idea of their competitive field again very little effort is made to get an accurate picture record of the extent of this field, where it can be wisely and economically cultivated, and the economic limits of ship-

ping and service. This should be painstakingly done in every growing business.

(e) Educating Wholesale Men to Merchandising Possibilities: No wholesale man should work without a definite plan of increase based, not on haphazard solicitation, but on **studied** solicitation that will give the best return for time expended.

His interest in your advertising should go beyond the mere delivery of display material to the dealer and he can save you hundreds of dollars in educating the dealer to make such use of it as will make it mutually profitable. The right sort of a house organ mailed each month to the dealers will help keep up interest between calls and aid him in the contact work.

(f) Formation of Strong Mailing Lists: As you grow to use direct advertising methods, the success of your plan will be measured largely by the proper selection of names for your mailing list.

To create trade and prestige for your dealers you must reach two classes and a name must either fall within one class or the other to be useful to you. The first class consists of people who are themselves consumers of cream to a fair amount and thus open to cultivation and development. The other class are those who, through contact with a large number of other people, are able to do you a great deal of good in unconscious "word of mouth" advertising. Thus a good mailing list would contain the names of the officers of all clubs and lodges, school teachers, ministers and priests, doctors who would be interested in the purity of your product, domestic science instructors, trained nurses—all of whom are people who have contact with many others and whose good opinion counts in moulding your local reputation.

In securing the names of consumers—blue books, social directories, membership lists of the better clubs, and home addresses of women secured through co-operation with those dealers whom you wish especially to build up, are your best sources. The wives of members of Rotary, Kiwanis and other business lunch clubs form excellent lists and you have the added opportunity of distributing an initial piece of advertising at lunch to start the ball rolling.

(g) Proper Selection and Distribution of Advertising Material: In selecting the material for your plan proper card records on dealers will give you an accurate guide as to the quantity required. There is no need to supply a five dollar window display to a store handling bulk and cones only.

Window displays in the larger stores should, wherever possible, be put up by your own people, and hanging cards or counter signs either cleaned or changed frequently enough to keep them fresh and attractive.

The materials you select should show continuity. Avoid pretty pictures that are general in character and too often distract attention from your product instead of attracting attention to it.

Use color wherever it is possible and let your illustrations run largely to reproductions of the cream itself, attractively served, delicious and inviting and occupying the foreground of the picture to the exclusion of everything else. Backgrounds should be unobtrusive and in soften tones, carrying out just enough detail to give an atmosphere of class and quality.

Sidewalk signs where they are allowed by city ordinance are good.

Billboards are used too often in cases where they do little if any definite good, but they appeal to the vanity of the user, who likes to see his name in big print, consequently they are bound to be used. In spite of anything that may be said to the contrary, the fact remains that people have not yet been taught to ask for ice

cream by brand and ice cream is seldom asked for by brand. The best place for advertising display is outside the store, in the windows and on walls and counters. Here the display of your signs informs the public that your cream is on sale and, prompted by the reputation for quality you have created, people feel free to purchase because they are on the spot and it is convenient for them to do so.

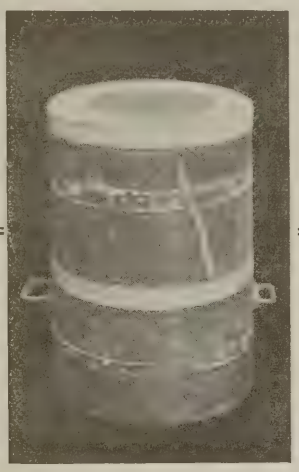
To jog their memory outside the store and cause them to go from store to store seeking your goods and refusing all others is quite a different matter. That is why direct mailing lists should be built up in sections and neighborhoods where you are prepared to supply the demand and where your co-ordinated advertising completes the circle and through continuity of expression rounds out the sale.

Before closing I want to touch on two or three other points that are important. First, quality of product. That is your best advertisement. Neither I nor any other advertising man can offer you anything better, and it is a fact that no advertising, no matter how clever, can continue year after year to sell an inferior product. Advertising will bring people to a trade but it will not hold them if the product does not satisfy and please them. No one can afford the drain of continually advertising to a new audience. If your advertising is to be financially profitable your product must hold the trade you gain and make new friends in the bargain.

Another point is that of giving your business a personality, for there is personality in business just as there is in the individual. A man without personality is handicapped and a business without personality is hampered in growth because it takes people longer to hear of it and is less deserving of public interest.

Last and most important of all—get the confidence and respect of your community. Never break that confidence through poor goods, sly dealing, or unfair methods, and don't quarrel among yourselves.

Good clean competition based on the right rules of business and friendship will make business for all concerned because in reaching out for more business, you automatically create new business from the public far in excess of the old business you take from a competitor.



"Knifing" competition, on the other hand, causes you to give your property to the dealer, necessitates advertising expenditure beyond the bounds of good sense, and makes you easy prey for any one who cares to play the one against the other to the detriment of both.

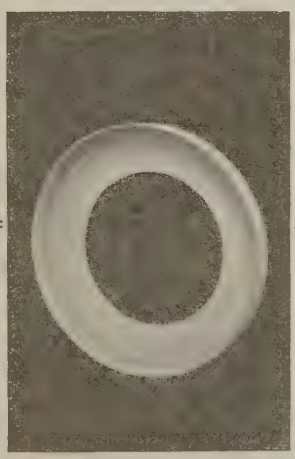
You on the Coast have fewer heritages in the way of old time methods, old plants, and old prejudices. You're off to a fresh start and can build as you will in a business that is growing as rapidly as any good business in America.

Steer straight, have a plan and keep faith with the public by giving them a full measure of value and you will find not only financial demand but the satisfaction of growth through service which, after all, must be at the root of every permanently successful business.

CORRECTION.

In the last issue of The Ice Cream Review, on page 141, in News From Far and Near, we published a small item which read: "The Creamery Package Manufacturing Co., of Chicago, Ill., will build a new factory and warehouse in St. Paul. The cost will be about $120,000." This should not have been published as notice had previously been received direct from the Creamery Package Manufacturing Company that plans for this new factory had been indefinitely postponed.

Have Your Tubs This Protection?



When your packers are dragged along over rough concrete floors—flung around as so much junk by the express companies, and given innumerable severe bumps when unloading from trucks,—what is there to protect the bottom against the "springing" this vicious abuse sooner or later must cause?

The Roman Reinforcing Hoop Ice Cream Tub Protector is ample protection. A substantial metal rim that needs no tools to apply except those illustrated.

These Protecting Hoops have proved their worth wherever employed. They will do the same for you.

Write for circular and prices.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—I have been using your formula to a great success and want you to give me another and also estimate what it cost me, also what do you figure it costs a gallon where you use a brint freezer and have no hardening room and have to pack your cream with ice.

Here is what I want, a formula for 10 per cent butterfat and 12 per cent butterfat ice cream also. Estimate cost for me. I want to use, sugar, flavor and gelatine, evaporated milk, sweet butter, skimmilk powders.

I. E. P.

Reply: I am glad to know that you have had good success in making ice cream this year. I am, according to your suggestions, giving you below in Table No. 1 and Table No. 2 formulas for both a 10 per cent and 12 per cent ice cream using the ingredients mentioned in your letter.

Table No. 1.

10 Per Cent. Formula.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	....	....	11.40
1.0 lbs. gel. and flavor	....	....	.75
16.0 lbs. 8% evap. milk	1.08	2.88	3.96
10.6 lbs. 84% butter	8.904	....	8.90
8.4 lbs. skimmilk powder	....	7.98	7.98
52.0 lbs. water	....	....	....
100.0 lbs.	9.984	10.86	32.99

Table No. 2.

12 Per Cent. Formula.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	....	....	11.40
1.0 lbs. gel. and flavor	....	....	.75
16.0 lbs. evaporated milk	1.08	2.88	3.96
13.0 lbs. 84% butter	10.92	....	10.92
6.3 lbs. skimmilk powder	....	5.97	5.97
51.7 lbs. water	....	....	....
100.0 lbs.	12.00	8.85	33.00

You can very easily figure out the difference in the cost between these two formulas. You will notice that while you use more butter in the second formula you use a little less skimmilk powder. You will probably find that there is very little difference in the cost of these two mixes. You will probably be able to secure a little higher overrun from formula No. 2 than No. 1 which would compensate for a little higher cost.

* * *

Dear Sir:—Am sorry to bother once more, will state fully just how I receive my cream. I get the 30 per cent emulsified cream, 10 gallon cans which weigh 84 lbs. I would rather cut out some of the milk as that will bring my weight down nearer to the 300 lb. batch.

I pasteurize my batch and add the cream after I have cooled it down. I did not think it necessary to pasteurize it as it is emulsified cream, am I right? I would like to make my cream 10½ or 10¾ per cent butterfat so I am in the clear and also I can add my fruits and nuts and still have the 10 per cent.

I will furnish you another mix with not so much milk and will add my gelatine dry, and if you will be so kind to analyze and return to me and if I have added too much powdered milk or not enough please change it. Would like to make my batch so I can have enough butterfat that when I make fruit and nut cream I can add it and still have 10 per cent left. I use 1 quart berries to 10 gallons finished product or 1½ lbs. nuts to 10 gal finished product.

164 lbs. 3 per cent milk, 84 lbs. 30 per cent cream, 36 lbs. sugar, 12 lbs. powder milk, 2.75 lbs. gelatine, 70 lbs. extract or coloring, total 303.45. A. M. & Co.

Reply: I have analyzed the formula which you state you are now using and you will find the analysis below in Table No. 1.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
164.0 lbs. 3% milk	4.92	13.15	18.07
84.0 lbs. 30% cream ...	25.20	5.25	35.45
36.0 lbs. sugar	.....	.....	34.20
12.0 lbs. skimmilk powder.....		11.40	11.40
2.75 lbs. gelatine		.....	2.60
.70 lbs. extract and color....		.....	.10
299.45 lbs. mix	30.12	29.80	96.82
Per cent	10.04	9.93	32.28

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
36.0 lbs. sugar		.....	34.20
3.50lbs. gel. flav. & color		.....	2.75
90.0 lbs. 30% cream ...	27.0	5.61	32.61
156.50 3% milk	4.69	13.51	18.20
14.0 lbs. skimmilk powder		13.30	13.30
300.0 lbs. mix	31.69	32.42	101.06
Per cent	10.56	10.80	33.68

You will notice that your present mixture is a little low in butterfat and also in milk solids not fat. With this mix you could not add fruit or nuts and make an ice cream complying with the Kansas state laws. I am suggesting in Table No. 2 how you could improve this mix and have it not only comply with the state laws but have it contain enough butterfat and serum solids so that you could add fruit or nuts and still have it test according to your standards.

I believe that if you will use the mix as indicated in Table No. 2 you will have no difficulty in securing a satisfactory result.

* * *

Dear Sir:—Your courtesy is herein acknowledged and we wish to extend our thanks for your valuable assistance thus far and beg to ask you one or two more questions in connection with which we are returning our original inquiry sheet.

The first item on this sheet is 40 per cent cream which you claim to have a total solids of 45.34 and milk solids of 8.90. Now shouldn't the butterfat and milk solids make the total solids? This being true, the total solids would be 40.00 plus 8.90 or 48.90. Against your figures of 45.34 or a difference of 3.56.

Again shouldn't the milk solids and water balance the total skimmilk? In the example referred to you show milk solids to be 8.90 and water 54.66 making a total of 63.56 against a total skimmilk of 60.00 or a difference of 3.56.

Against the second item "sweet milk" you did not show the amount of water and total solids per gallon.

If you will be so kind as to enlighten us on these points we assure you the same will be appreciated.

M. H. B.

Reply: The figures which I gave you are correct if you understand the calculations. In the first place, when you have a 40 per cent cream, 100 lbs. of cream will contain 40 lbs. butterfat and 60 lbs. skimmilk. In order to get the number of pounds of serum solids in 100 lbs. of cream you multiply 60 by 8.9 per cent which gives 5.34 lbs. serum solids. 8.9 per cent is the figure to use for calculating the percent of solids in skimmilk. You will also readily see if you add 5.34 and 54.66 you will get 60 which is the total weight of skimmilk in 100 lbs. of 40 per cent cream. Under the second item of sweet milk the calculations can be made in the same manner—subtracting 3.5 lbs. from 100 leaves 96.5 lbs.

skimmilk. Multiplying 96.5 by 8.9 per cent equals 8.58 lbs. of solids in the 96.5 lbs. of skimmilk. If the serum solids are to be figured on 100 lbs. of whole milk the percent should be 8.5 instead of 8.9. The total solids of whole milk is 12 per cent, which figure you can arrive at by adding 3.5 and 8.5.

* * *

Dear Sir:—Please give me a formula for commercial ice cream of 8 per cent fat and about 34 per cent solids for using skim powdered milk, sweet butter, gelatine and sugar per 100 pallons. Also formula for using as much 3½ per cent milk and powder, butter and other ingredients per 100 gallons.

Reply: Replying to your inquiry forwarded from Milwaukee, Wis., I am glad to suggest to you below in Tables No. 1 and No. 2 two formulas as requested.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs. sugar	.....	.....	11.40
1.0 lbs. gelatin and vanilla (12 oz. gelatine)	.....	.....	.75
9.53 lbs. butter 84%	8.005	.....	8.00
14.60 lbs. skimmilk powder	.....	13.85	13.85
62.87 lbs. water	.....	.....	.....
100.0 lbs. mix	8.005	13.85	34.00

For 100 gal. ice cream mix would be five times 100 lbs. mix, or, 60 lbs, sugar, 5 lbs. gelatine and vanilla, 47.6 lbs, butter, 73.0 lbs. powder, 314.4 lbs. water.

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
12.00 lbs. sugar	....	.....	11.40
1.0 lbs. gelatine & vanilla	....	.....	.75
7.0 lbs. skimmilk powder	....	6.65	6.65
73.5 lbs. 3½% milk	2.56	6.32	8.88
6.5 lbs. butter	5.46	.....	5.46
100.0 lbs. mix	8.02	12.97	33.14

You will notice that in Table No. 2 I have suggested a formula containing only 33 per cent solids instead of 34 per cent as you requested. I believe you will find that a total solids of 33 per cent is sufficiently high for a satisfactory ice cream.

* * *

Dear Sir:—Will you kindly give us a formula for a one hundred pound mix in which we use sweet butter, milk powder, sugar, gelatine and ice cream powder. We desire the finished product to test twelve per cent butterfat. F. W. K.

Reply: I am glad to give you below in Table No. 1 a suggestion for 100 lbs. of ice cream mix containing 12 per cent butterfat and 33.5 per cent total solids.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
12.0 lbs sugar	.....	.....	11.40
1.0 lb. gel., ice cream pow.	.....	.....	.75
14.3 lbs. 84% sweet butter	12.01	.....	12.01
9.8 lbs. skimmilk pow.	.....	9.34	9.34
62.9 lbs. water	.....	.....	.....
100.0 lbs. mix	12.01	9.34	33.50

I trust that this information will be of help to you and I should like to have a letter from you stating what results you have obtained after using this formula.

* * *

Dear Sir:—In answer to your letter referring to ours regarding a good ice cream mix for points in this state, our state standard calls for 12 per cent butterfat, same having been changed from 14 per cent just this last session of the legislature. We want to use as little as is necessary of 8 per cent condensed milk, containing about 30 per cent of total solids. We do not like to use

any more than is absolutely necessary to bring our standard to 38 per cent in our completed mix, for we find it flavors our cream to use too much of this condensed. We have been using a formula of 192 lbs. of 45 per cent cream and 289 lbs. skim, 126 lbs. of sugar and 4½ lbs. of gelatine. We also tried whole milk evaporated down to the desired consistency, but find this had a more or less burnt taste.

We would greatly appreciate a formula from you giving us a 12.16 per cent butterfat and 38 per cent total solids, using about 120 to 126 lbs. of sugar.

F. C. M. Co.

Reply: I have your letter with further explanation as to just what you desire in the way of a suggestion for your ice cream mix. I am giving you below in Tables No. 1, 2 and 3 suggestions as to how such mixes can be made.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
126.0 lbs. sugar	.....	.....	119.70
4.5 lbs. gelatine	.....	.....	4.27
400.0 lbs. 8% evap. milk.	32.00	88.00	120.00
200.0 lbs. 45% cream....	90.00	9.81	99.81
270.0 lbs. skimmilk	.....	24.02	24.02
1000.0 lbs. mix	122.00	121.84	367.81
Per cent	12.20	12.18	36.78

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
140.0 lbs. sugar	.....	.....	133.00
5.0 lbs. gelatine	.....	.....	4.50
200.0 lbs. 8% evap. milk	16.00	44.00	60.00
235.0 lbs. 45% cream..	105.75	11.50	117.25
420.0 lbs. skimmilk	.....	37.38	37.38
1000.0 lbs. mix	121.75	92.88	352.13
Per cent	12.175	9.288	35.21

Table No. 3.

Ingredients	Fat	Serum Solids	Total Solids
140.0 lbs. sugar	.....	.....	133.00
5.0 lbs. gelatine	.....	.....	4.50
400.0 lbs. evap. milk	32.00	88.00	120.00
200.0 lbs. 45% cream	90.00	9.79	99.79
255.0 lbs. skimmilk	.....	22.70	22.70
1000.00 lbs. mix	122.00	120.49	379.99
Per cent	12.2	21.04	37.99

You will notice in Table No. 1 that in order to get above 37 per cent total solids using 126 lbs. sugar it would be necessary to use 40 per cent evaporated milk or 400 lbs. in 1,000 lbs. I readily agree with you that that would be too much evaporated milk and it would impart a flavor to your product.

In Table No. 2 I am suggesting a formula which I believe would be entirely satisfactory. By increasing the amount of sugar to 14 per cent the evaporated milk can be reduced to 200 lbs. This will produce a mix with 37 per cent total solids which in my opinion is plenty of solids for a 10 per cent ice cream. Should you desire a mix with 35 per cent total solids as you suggest, Table No. 3 will give you an idea of such a formula. You will again notice that in this case you would need 400 lbs. of evaporated milk.

* * *

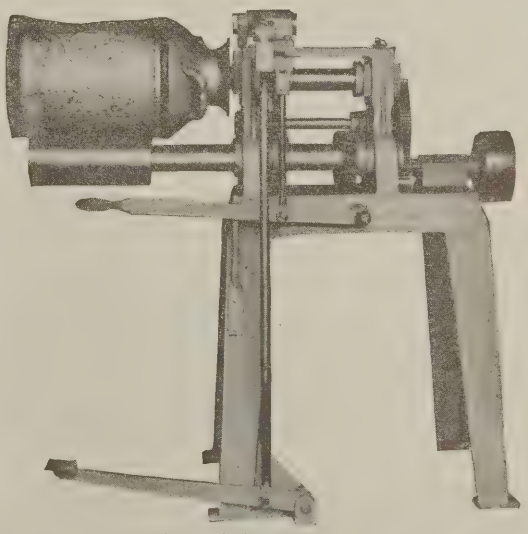
Dear Sir:—I would thank you to analyze our mix, which is as follows: 160 lbs. 3 per cent milk, 60 lbs. sweetened condensed, 43 lbs. 84 per cent sweet butter, 12 lbs. sugar, 9 oz. gelatine, 9 oz. vegetable gum.

Recently we received a barrel of the condensed that was considerably thicker than usual, from this we have had two complaints, one being that it was very hard to keep the cream frozen, second that the cream tasted sandy. It seemed to have some of the undissolved particles that a person finds in the condensed. In making

A Good Way To Economize

For a reasonable expenditure per can we give them a new lease on life that in many cases doubles the usual length of service.

Then, too, dented cans are expensive to use, especially if you buy "by the can," you don't get the full measure you pay for.



Why continue to deceive yourself when an economical remedy is possible thru "Manitowoc" Rebuilding and Retinning Service. Satisfaction Guaranteed.

Let us tell you more about our service and some of the many customers who use it.

Manitowoc Plating Works

Mfrs. "Wacho" Can Straightening Machine
Electro Platers, Tin Platers and Galvanizers
Tinning a specialty.

MANITOWOC WISCONSIN

This machine will straighten cans in your factory—better than one a minute—by just stepping on a lever. No noise—No dirt. Our circular tells all about this machine. Send for one.

Ranks Next in Demand To the Staples

One Middlewestern ice cream manufacturer told our representative recently that previous to last season he had had very little call for maple.

Then he began to use **Mapleine** and demand grew until now **Mapleine Ice Cream** is his best selling ice cream next to the staples.

Mapleine

Mapleine built up maple sales for this manufacturer and will do the same for you because it gives flavor that is a perfect maple. Customers like it.

And because 16c to 20c flavors 10 gallons Mapleine Ice Cream you will find it a profitable combining flavor in Neapolitan Bricks.

$3 brings a quart bottle for trial.

Planning The New Factory

If you contemplate the erection of a new factory or an extension to your present one, it will be to your advantage to investigate our service.

We lay out a factory on the basis of what, how and how much it will produce, and then design the building and the proper arrangement of modern labor saving devices for the greatest production efficiency.

Our experience assures you a serviceable building, economically constructed and attractive as an advertising asset.

You assume no obligation in discussing your problems with us.

HATTON HOLMES & ANTHONY
Engineers and Architects.
Masonic Temple Cedar Rapids, Iowa

our mix, we mix accordingly, we put the milk in a batch mixer, which we heat to 145 degrees, and as this is heating we add the butter and sugar, with the vegetable gum mixed in it. After it has reached 145, we cool down to 120 degrees add the gelatin, which has been dissolved in hot water, after being mixed through we put through a No. 0 Viscolizer and over a Chilly King cooler, then place in a cooler for about 24 to 48 hours, then freeze in a Perfection freezer with 10 degree brine. Kindly advise what would cause the above two complaints, and also if you would suggest a different mix than that we are using. H. F. M.

Reply: I have your letter with a request to analyze your ice cream mix. You will find a complete analysis of your mix given below in Table No. 1.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
160.0 lbs. 3% milk	4.80	13.0	17.80
60.0 lbs. sweet cond. milk		16.2	40.20
43.0 lbs. 84% butter....	36.12	....	36.12
12.0 lbs. sugar	.....	....	11.40
1.2 lbs. gelatine & gum	.....	....	1.14
276.2 lbs.	40.92	29.2	106.66
Per cent	14.8	10.5	38.6
Per cent sugar .....13.0 plus			

From the discussion given in your letter it appears that the reason your ice cream tastes sandy at times was because your mix contained too high a percentage of skimmilk solids. This sandy condition is not usually apparent immediately after the ice cream is frozen but begins to become apparent after storage in the hardening room for a number of days. It is due to the recrystalization of the milk sugar in the sweetened condensed milk. If you find that certain lots of condensed milk are considerably thicker than usual I would use a smaller quantity of this condensed milk.

You could very easily reduce the amount of sweetened condensed milk to 40 lbs. and still have plenty of solids in your ice cream due to the apparent large quantity of butterfat. If you do this I am sure you will have no more trouble with sandy ice cream.

* * *

Dear Sir: Having read your comments in The Ice Cream Review, giving your different views and analyses of the different mixes of ice cream batches, I am taking the liberty of addressing you a few lines in regard to ice cream mixes.

We are making a little ice cream, and wish to make more, but owing to our ice cream not being the way it should be we are not pushing the sales.

In making our mix ready we use the following material for ten gallons; finished cream, using the old style tub and can method of freezing, 47 lbs. 12 per cent cream, 2 lbs. skim milk powder, 6 lbs. sugar, 9 oz. Fairy powder, 2 oz. vanilla. The sugar and powder we mix and put in the above mix and let stand for one hour before freezing. Sometimes we include in mix one ounce Washburn's ice cream improver.

We have a Sharples emulsifier and use the following to make 20 per cent cream: 62 lbs. butter, 174 lbs. water, 20 lbs. skimmilk powder. This we let stand 48 hours before using. When we make our mix from the above we reduce the cream to 12 per cent. Now in freezing the emulsified cream and using the formula as stated above, we do not get a nice, smooth cream. It is coarse and rough-like. Can you tell us the trouble and also give us a formula for freezing our cream? It usually takes from 20 to 40 minutes to freeze a batch. L. D. C.

Reply: Your formula or mix is all right in butterfat but is low in solids. I suggest that you increase your

sugar content one pound and increase the skimmilk powder by two pounds.

I do not know just what material your "Fairy powder" is, but I suggest that if you continue to have the trouble with icy and coarse ice cream that you substitute four or five ounces of a good, high grade gelatine in place of the Fairy powder and then make up your mix so that you can age it forty-eight hours before freezing.

I do not see why you should need twenty or forty minutes to freeze a batch in your ice cream freezer for you can easily regulate the temperature of your brine in your freezer by using more salt so that it will freeze faster. It ought not to take longer than twelve to fifteen minutes to freeze a batch satisfactorily. I also suggest that you keep track of the yield as you stated that your cream had a rough and coarse-like appearance. It is possible that you are whipping it too much and get too high an overrun. After trying out some of these suggestions I shall be very glad to have you write again and explain some more of your difficulties in detail and I shall be glad to assist you further.

* * *

Dear Sir: Will you kindly analyze and criticize the following mix: 90 gallons whole milk, not less than 4 per cent butterfat; 90 lbs. skimmilk powder, 60 lbs. sweet creamery butter, 100 lbs. sugar, 6.4 lbs. gelatine. If this mix won't come up to the standard of our state laws, will you kindly figure out one for me? F. G. S.

Reply: You will find a complete analysis of your mix given below in Table No. 1. You will notice that the butterfat figures less than 8 per cent, but your serum solids are very high. I also notice that you are using less than 10 per cent sugar, which in my opinion does not make the product sweet enough. I am suggesting in Table No. 2 a 1,000 lb. mix with 10 per cent butterfat, using a little less milk serum solids. I should like to have you try this out and let me know what results you get.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
90 gal. or 774 lbs. 4% milk	30.9	65.90	96.7
90 lbs. skimmilk powder	....	85.50	85.5
60 lbs. 84% butter	50.4	.....	50.4
100 lbs. sugar	....	.....	95.0
6.4 lbs. gelatine	....	.....	6.08
1026.4 lbs.	81.3	151.40	333.68
Per cent	7.9	14.7	32.5

Per cent sugar, 9.76.

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
120 lbs. sugar	....	.....	114.0
6 lbs. gelatine	....	.....	5.4
70 lbs. skimmilk powder	....	66.5	66.5
85 lbs. 84% butter	71.40	.....	71.4
719 lbs. 4% milk	28.76	62.0	90.76
1000 lbs.	100.16	128.5	348.06

Reply: Replying to your letter of recent date requesting that your ice cream mixes be analyzed, I am giving you below in Tables No. 1, 2 and 3, calculations showing the proportions of the ingredients in your mix:

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
130 lbs. butter, 80%	104.0	.....	104.00
200 lbs. sweet condensed	.....	54.0	134.00
205 lbs. sugar	.....	.....	195.75
7 lbs. gelatine	.....	.....	6.65
850 lbs. 3.5% milk	29.75	73.0	102.75
1392 lbs.	133.75	127.0	542.15
Per cent	9.6	9.1	38.9

Per cent sugar, 20.4.

Table No. 2.

Ingredients	Fat	Serum Solids	Total Solids
50 lbs. 40% cream	20.00	2.70	22.7
145 lbs. 80% butter	135.00	.....	135.0
1105 lbs. 3.8% milk	41.99	94.61	136.6
250 lbs. 8% cond. milk	20.00	45.00	65.0
9 lbs. gelatine	.....	.....	8.55
260 lbs. sugar	.....	.....	247.0
1819 lbs.	216.99	152.31	614.85
Per cent	11.9	8.3	33.8

Per cent sugar, 14.0.

Table No. 3.

Ingredients	Fat	Serum Solids	Total Solids
170 lbs. 80% butter	136.0	.....	136.00
250 lbs. sweet cond.	.....	67.50	167.50
1020 lbs. 3.5% milk	35.7	87.58	123.28
260 lbs. sugar	.....	.....	247.00
11 lbs. gelatine	.....	.....	10.45
1711 lbs.	171.7	155.08	684.23
Per cent	10.0	9.06	39.9

Per cent sugar, 21.04.

You will notice that in Table No. 1 as well as in Table No. 3 your mix figures out extra high in sugar. This is probably due to the fact that you are using sweetened condensed milk and did not figure the amount of sugar added in this way. The sweetened condensed milk contains 40 per cent sugar, which would in Table No. 1 (where you have used 200 lbs.) amount to 80 lbs. of sugar. You will see that you could materially decrease the amount of sugar to be used and still have about the right amount.

Table No. 2 shows about the results that the right kind of a mix should contain—about 34 per cent total solids and 14 per cent sugar. Both of the mixes represented in Table No. 1 and No. 3 can be made quite satisfactory if you will cut down on the amount of sugar.

ARMSTRONG CORK AND INSULATION COMPANY OPEN MILWAUKEE OFFICE.

The Armstrong Cork and Insulation Company, of Pittsburgh, Pa., has opened a new office in Milwaukee at 1011 Majestic building. This office was opened to give better service to the Wisconsin and upper peninsular territory and will be in charge of Mr. Hugh Krampe.

Mr. Krampe has been with the Armstrong Cork and Insulation Company for the past ten years. He has had a great deal of experience in the sales engineer and in various insulation work. Anyone interested in refrigeration can communicate by addressing him in care of the Armstrong Cork and Insulation Company, 1011 Majestic building, Milwaukee, Wis.

INDIANA ICE CREAM MANUFACTURERS' ANNUAL MEET.

(Continued from page 75)

Mr. Nance: I want to take issue against you on this six cents a gallon proposition. Ordinary good modern containers would cost at least one cent each. I do not figure where you get that in the pints. It is my opinion that it would cost nearer twenty cents than six cents. From experience we find it runs nearer twenty cents.

Answer: Your cost would be very much less when you fill with the packaging machine than with hand filling. That is, one of the big arguments in favor of the packaging machine. The amount named referred to quart containers.

Mr. Holly: Mr. Mojonnier, in this section of the country—the central west and the north—how does the amount of brick sold now compare with five years ago?

Answer: I would not have any exact data to answer that question.

Mr. Holly: Is there a continual increase? In the section through here, is there a general increase?

Answer: I think that your output of brick ice cream in Indiana is probably lower than it is with us in Illinois.

Mr. Fields: Mr. Mojonnier, how about the overrun—how does that hold up?

Answer: There is no loss in the overrun, when using the packaging machine.

Mr. Antrim, Indianapolis: Would there be a loss if you did not run the machine for some time? Suppose you would run 50 or 100 gallons, you would have a loss then, would you not?

Answer: Not necessarily. The hopper is insulated and refrigerated.

Mr. Reeves, Indianapolis: Would it be practical, if it were possible, that your brick machine could be placed on the floor beneath the ice cream freezer?

Answer: There would be no difference in that respect. It would be only a little more convenient.

Mr. Holly: Has there been the trouble this year that there has been in previous years, as far as your observation goes, as to grainy and sandy ice cream?

Answer: I would say that there has been in certain sections of the country.

Mr. Holly: In this section?

Answer: Not so many reports have come to us.

Mr. Holly: There are some here who are puzzled about grainy and sandy ice cream. Are you able to state to us how to avoid grainy or sandy ice cream? I know there are some men here who would like to hear what you have to say on this subject.

Answer: I will be glad to tell you anything I may know about this subject. Manufacturers have come to us from many different parts of the country, who reported this trouble. Years ago there was apparently not very much definitely known about the subject, so we started some experiments in our own laboratory to arrive at the principles involved. The manufacturing conditions prevailing in some localities are responsble for producing sandy ice cream. There is more trolble in certain eastern sections than in all the rest of the United States put together, because as most of you gentlemen know, they make ice cream high in milk solids not fat, and that is the condition under which you will get sandy ice cream more than any other. Sandiness is caused primarily by only a few different factors, and most important of all is the composition of the mix itself. The sandiness is caused from an excess of milk sugar in

Why Redwood should be used for Ice Cream Cabinets and Refrigerators

Properties which make Redwood unrivalled for these purposes

ABILITY to keep heat out and cold in, is the test of refrigerator worth. This is directly dependent on the insulating quality of the materials, from which it is made. After experimenting with many kinds of wood, leading manufacturers of ice cream cabinets, refrigerators and cold storage plants have adopted Redwood for the following reasons:

Redwood is a remarkable insulator

The structure of Redwood is distinguished for the regularity in size and shape of its sap cells, and for the uniformity of texture they give. When the sap is dried out, these cells become air pockets—layer on layer of them—which act as almost perfect insulators to heat. With a freezing temperature on one side of a Redwood board, the other side remains at room temperature—does not sweat.

Redwood properly dried is "still" wood

Properly dried Redwood does not warp, swell, or shrink. Redwood "stays put"—joints tight—no bulging or leaking.

Redwood does not rot

Every fibre of Redwood is impregnated with a **natural** preservative which prevents decay from moisture. Acid and alkali solutions, salts and oils do not destroy Redwood. Insects and worms do not attack Redwood.

Redwood is easy to work and can be given any finish desired

With true grain, soft, light in weight and unusually free from knots, splits and other blemishes, Redwood can be manufactured to any dimensions desired with a minimum of labor and a minimum of waste. Its uniform cell structure provides excellent surfaces for holding paint or varnish—enables Redwood to be given any finish desired.

your mix, and that of course is obtained from your milk solids not fat.

If you do not exceed a limit of 12 to 12½ per cent of milk solids not fat, you are not liable to have any trouble with sandy ice cream. It would probably be best under certain conditions to remain under that percentage. Say ten per cent might be your limit in the winter months when the ice cream is moving more slowly, and in the summer you can slightly exceed 12 per cent and never have any trouble with sandy ice cream. Another big factor is the length of time the ice cream is kept after it leaves the freezer. You might have certain flavors that are moving rapidly, and you never hear of sandy ice cream in these flavors. Other flavors from the same batch of mix that move slowly may develop sandiness.

Of course the temperature of the hardening room and the temperature of the ice cream in the dealers' cans all enter into the problem, but the two main outstanding factors of the whole case are first, the composition of your mix, and to give you an outside figure, where your ice cream is not kept for any length of time, about 12 per cent, and in the winter time, or during any slow movement about 10 per cent milk solids not fat; the second important factor is the length of time that your ice cream is kept before it goes to the consumer.

Mr. Edward, Marion, Ind.: The matter of solids has been beat into us here in the last three years up to 32 and 35 per cent, and we have all been going to it, and I think we have made less money at it than ever before, and now you come along and tell us 12 per cent solids.

Answer: I referred to milk solids, not fat only. Your reference is to total solids. You should be able to make a high quality of ice cream mix if you keep your total solids within the limits which you named. The various constituents making up your total solids must be in the right proportion one to the other. For example, 9 per cent fat, 11.50 per cent milk solids not fat, 13 per cent sugar, .50 per cent water free gelatine, making 34 per cent total solids, makes a very fine quality of ice cream.

Mr. Edward: I have just heard recently about a process of making ice cream without gelatine. Have you found out anything about that?

Answer: I think that is being tried out. It has been demonstrated by so many years of actual experience that the use of gelatine is helpful in the making of ice cream. It prevents water crystals from becoming large, and thus it helps to produce a smooth ice cream. That is the main function of the gelatine. I would not recommend that you try to get along without gelatine at the present stage of our knowledge of this problem. Possibly this may be done at some future time. * * *

Then followed discussions on general matters as follows:

By Mr. Holly: There are several important things which might be profitably discussed this afternoon, and inasmuch as the only address on the program is the one just given, this opportunity is now open to you.

We have talked about the State Fair of Indiana, and the opportunity which it offers to the ice cream men, as well as others in the dairy industry to profitably advertise their wares. In the state of Illinois last year, I am told—that is this year—that an expenditure of $2,500 was made by the ice cream men in Illinois. Ice cream was manufactured there. The opinion of two or three men I have talked to from Illinois was that it was a decidedly fine advertising medium.

Mr. Henry Schlosser, have you anything to say on the subject of advertising dairy products at our State Fair?

Mr. Schlosser: What I think the manufacturer of dairy products should do is to go before the State Board of Agriculture and tell them that we want a suitable building equipped for housing dairy exhibits, and that we are going to advertise dairy products at our own State Fair.

Purdue has made a number of efforts to have dairy products exhibited, but there has never been any exhibition as far as the state was concerned. I think we should have proper arrangements made with the Board and put under State management.

Mr. Holly: Won't somebody else express an opinion about having ice cream advertised at the State Fair?

Mr. Antrim, Furnas Ice Cream Co.: Why could not that be taken up and worked out through Purdue? They have an exhibit there anyway. It seems to me that would be the thing to think about.

Mr. Reeves: I do not believe Purdue could do anything with it with the present equipment they have.

Mr. Miller: I do not think the Purdue building is located in the right place and does not draw the right crowd in there. The new brick agricultural building is not very suitable, I do not believe. What we need is a suitable building. I do not see where we could make any headway in the present buildings.

Mr. Fields: The time is now to do something if we are ever going to. They are planning new buildings, and if we go before the board at the present time, and tell them that we want the right kind of a building, I think we can get it, but if we wait, it will be too late. If we ever want to do anything in the state of Indiana along this line, we should do it now.

Mr. Holly: The Agricultural Board, as you probably all know, are waiting to complete plans whereby at least one and possibly two new buildings will be erected on the State Fair grounds. Provision would probably be made for this organization in case they see fit to take advantage of it whereby a suitable building would be provided for an exhibit of dairy products. As the grounds are at present, it seems to be the general opinion that no satisfactory display could be made. The Agricultural Board of Indiana, I am safe in saying, would be favorably disposed to entertaining such a proposition from this organization in case you see fit to make it.

Mr. Klepper: Do I understand this would cost in the neighborhood of $2,500?

Mr. Holly: I stated that the state of Illinois spent about that much.

Mr. Klepper: Then there would be a cost to this organization if this would go through?

Mr. Holly: That would depend on what kind of an exhibit you wished to put in.

Mr. Klepper: My personal opinion is that it should be put through Purdue. The territory around Indianapolis would be benefitted by it, but the people from the northern part of the state do not know that there is a State Fair down here. If it could be worked through Purdue, I think it would be the proper way.

Mr. Stucky: I move that we request Purdue University to get a desirable building to make a display and ask them to handle this ice cream proposition for us.

Mr. Holly: In other words, turn the responsibility of advertising ice cream for the state over to Purdue University?

Mr. Stucky: Yes—that is, with our co-operation.

Motion made by Mr. Stucky and seconded by Mr. Klepper that we request Purdue University to get a desirable building for the display of ice cream.

Chair: I wonder if it would not be better to include

Process and Apparatus patents pending. Beware of infringements.

in that motion "dairy products" instead of ice cream?

Moved that the words "ice cream" be changed to "dairy products."

Mr. Risch, Vincennes, Ind.: The object of this discussion, as I understand it, is to produce more sales of dairy products. This last October in Vincennes we had what we called a "fall festival." It was crowded every night. We had a booth in that festival for milk, ice cream and butter (here Mr. Risch spoke of the demonstration made with papier mache figures, manufactured by a firm in Canton, Ohio). What we want to do is to reach the children, and not the old people. We had that machine running around for four men hitting the striker, with the milk man hitting the striker, ringing the bell and making it go the highest. The children all stopped and looked at that. The booth was crowded all the time—day and night.

Advertise with something that is moving. Show what milk does. A booth out there at the Fair Grounds twice as large as the stage would probably cost $1,500 with moving devices, showing the value of milk products. Get these little moving pictures and put in the windows. We want to start with the children, and that is the reason I am so much in favor of his Fair Ground exhibition.

Mr. Holly: There was a meeting at the agricultural office in the State House last Tuesday morning, attended by Governor McCray, Mayor Jewett, one or two Indianapolis bankers and Farm Federation representatives, five or six railroad men, one or two interurban officials, and manufacturers of dairy products—about thirty or thirty-five in all, to entertain Mr. Van Norman, president of the National Dairy Show, and Mr. Skinner, its manager. This meeting was called in a very few hours.

At Chicago a week ago last Thursday, a formal invitation from the Agricultural Board of Indiana was presented to the executive board of the National Dairy Association to hold the show in Indianapolis at the State Fair Grounds. As a member of our organization, I encouraged this. There has been a considerable amount of enthusiasm worked up in a very short time toward having the National Dairy Show come down here. The opinion of several men is that it is a foregone conclusion that this may go to St. Paul, Minnesota, or maybe Chicago. It sas not been officially announced as to where it will go for 1922. The opinion of all with whom I have talked is that it would be a wonderful thing for the general dairy industry to have the National Dairy Show come to Indianapolis. It is attended by from 50,000 to 100,000 people from all the states in the Union. There are over 1,000 of the finest dairy cattle exhibited and dairy machinery is also shown there. There is also an educational exhibit. All of the up-to-date machinery is seen there. It is the meeting place of practically all national organizations who have anything to do with the general dairy business. It would not only be an Indianapolis fair—it would be an Indiana fair. State-wide support must necessarily be guaranteed, according to the fair officials, before they consent to go to any place. There will have been accumulated by tomorrow night a considerable amount of evidence which will indicate that Indiana is behind this proposition.

It is too late now for any concerted action for next year, but it is my opinion that this may come here in the year 1922 or 1923. Certainly the work that has been done so far cannot be lost. I speak of this to solicit your co-operation in any method that might occur to you. Now, you can put in a stroke in this or that way, as you stand in your own peculiar relation to this show, if you want this show to come to Indiana at some future date.

If the National Dairy Show does not come here next year, there is a good chance, as far as we can superficially judge, of it coming a year later.

Indianapolis is particularly well fitted for that sort of a show. The Agricultural Board is enthusiastic about it coming. They have charge of the State Fair grounds, and are making all effort toward having the new buildings constructed.

You know, Indianapolis has seventeen trunk lines. It is the biggest interurban center in the world. To be present at the interurban station at 5 o'clock on any day will convince a man there there is some interurban traffic centered in this city. Indianapolis has a total of fifty-one hotels, a good many of which are first class. Indianapolis is within sixty or seventy miles of the center of population of America. It is within 150 miles of the industrial center of America. The impetus that would be given to the production, distribution and consumption of dairy products in Indiana would be far greater than that resulting from any other kind of an advertising medium I can think of. So I ask you to be mindful of the possibilities in having the National Dairy Show in Indianapolis, for if not in 1922, then in 1923, simultaneously will be held the World's Dairy Congress. There will be representatives at this congress from all nations that have anything to do with dairying. It is the first time any such thing has ever been attempted. Indianapolis and Indiana want the National Dairy Show to come here in 1922.

One of our members wrote to us not long ago concerning a matter which I am reasonably safe in saying you will be interested in discussing, and I will call on Mr. Fosdick to mention that proposition.

Mr. Fosdick: I will speak of the matter of credits. We all have accounts on our books, I believe, a few years back, and something came up in regard to forming an organization whereby we could stop the sale of ice cream to any dealer who is delinquent in his payments. It seems to me that we could have a delinquent list in this association whereby we could protect each other. Every manufacturer could report his delinquent customers. We could make him pay his bills or quit buying ice cream.

Mr. Holly: Mr. Klepper asks if this is a local proposition. Iowa has a plan whereby this matter is handled. On account of this having been brought to my attention very recently, I have been unable to investigate just how those plans are worked, and I am not in a position to propose any particular method of handling it, but in Iowa, at least, it is handled as a state-wide proposition. Mr. Olson says it is likewise handled in Nebraska.

Mr. Holly: When I was in the ice cream business, I took on a customer, who when he quit us, owed us $118. He quit another fellow before he came to us, owing him $175, and the fellow whom he bought from before that one, he still owes over $400 to, and nobody will collect anything from him.

Mr. Atkinson: We had a little experience last summer. Personally, I think it is a splendid idea if we would co-operate. I would like to state an instance that happened to us. We had a customer who was buying in the neighborhood of forty gallons per day, and he was running a little behind in his payments. We put him on the C. O. D. list. At the same time, we tied up everything he had in the store in a way that we could have closed him in twenty-four hours. One of our competitors started selling this party ice cream. He refused to buy from us because we put him on the C. O. D. list. At that time he owed us 800. I asked this competitor if he was paying. "Yes," he said, "he pays every

Increases Winter Business

Think what it would mean to you to ask thousands of customers their first choice of fruit, and flavors, and then offer those same customers a combination of a dozen or more of those first choice fruits and flavors, made into a **Supremely Delicious Ice Cream.**

week." I told him that he owed us quite a little, and that was the reason we put him on the C. O. D. list, and he had agreed to pay so much a week. In a short while, he paid off the $800 to us, and by that time, the competitor put him on his C. O. D. list.

Mr. Miller: I suggest that a committee be appointed to investigate and work out this thing.

Mr. Holly: Put that in the form of a motion.

This motion was made by Mr. Miller, seconded by Mr. Fields, and carried.

Mr. Loewenstein: I would like to explain a system had in Illinois a few years ago. We adopted a plan of comparing lists of the different manufacturers. The different lists were sent in to the manufacturer's office and every manufacturer who would compute a list was entitled to a list of others. The result was that we found several people who were owing as many as thirty-five different manufacturers. This is a very important proposition at the present time—this credit system. Two or three years ago this was not of sufficient importance to warrant us going into, because everybody was paying their bills in a fairly good way, but now we have a different situation. The fellow who was good pay a year ago may be very slow pay at the present time, and I believe the different manufacturers ought to know the conditions that exist in the different localities so that they can protect themselves. Some fellows go from one manufacturer to another, and the first thing you know they are on the books for amounts ranging from $100 to $1,000 with several manufacturers, and they are making more money owing the manufacturers than the manufacturers can make out of the dealers by selling them ice cream, and if you adopt the system of exchanging lists, I believe you will be getting at the bottom of the proposition. In Illinois, anyone who was not sufficiently interested to protect the manufacturer did not get the list from the other fellow. If Jones sent in a list showing his delinquents, he got the list from all the other manufacturers. All we should report is the dealer who is slow in making his payments, or who makes complaints that are not business like. Some constantly complain of shortages. You ought to know that as well as the poor payments. This is a very vital subject and will save the manufacturers a lot of money.

Mr. Fields: I think this matter we have under discussion at the present time will mean a great deal to us within the next two years. We are going through a business depression that is liable to last that long and maybe longer. I think we are going to find our credits will be in a worse shape next summer than last. I think next summer we will have more trouble than we did last summer, and I think this matter will be of vital importance to the ice cream man within the next few years. I think we are on the right track. It will be a good thing if we can get it to working soon enough to take care of next summer's business.

Mr. Schlosser: I move that a committee be appointed by the chair to draft a plan whereby a satisfactory arrangement may be made to take care of this credit matter.

Motion seconded and carried.

Mr. Risch: I want to make a motion here that our Secretary be notified of the names of customers who have cans in an unsanitary condition, and that the Secretary in turn write these customers in this regard about three times a year—say the first of March, the first of June and the first of August. You can readily see that this will be beneficial to the people who send in the names.

Seconded and carried.

The Chair appointed a committee of three, consisting of Messrs, Fosdick, Fairchilds and Miller to take care of the credit matter.

Mr. Holly: At 6:30 our banquet begins, and there will be a photograph of all present. The Hoosier Wild Cats have charge of this program this evening, and the rest of us sit back and listen. They have secured a speaker who stands very high, Mr. Malloch.

The morning session will begin in this room at 9:30. Luncheon at noon, and session in the afternoon, when business matters will be discussed. Reports of officers, and the election of officers. If you have nothing further, we will proceed to the election of officers.

A motion was made by a member that a temporary committee of three be appointed to make a selection of two names for chairman and secretary.

Seconded by a member. Carried.

Hugh Lawrence, Roy Atkinson and Ed. Nance were appointed on this committee. The names selected by this nominating committee were W. A. Klepper and William Beach for chairman, and George Fosdick and Fred Eward for secretary. This vote was made by ballot, Mr. Klepper receiving 17 votes and Mr. Beach 12; Mr. Fosdick 25 votes and Mr. Eward 9.

Mr. Holly: The chairman of the Ice Cream Division is Mr. Klepper and the secretary, Mr. Fosdick. Mr. Klepper, it is your duty to appoint before the first of the year, a representative from this state association as a director in the National Ice Cream Association. This is the custom which has prevailed.

Mr. Loewenstein gave a talk on the subject of tax matters, and there being no further business, the meeting adjourned.

* * *

SECOND DAY — AFTERNOON SESSION.

The Convention was called to order at 1:15 p. m., Thursday, December 15th, Mr. W. A. Klepper in the chair.

Chairman Klepper: The only thing we have on the program, aside from the general business of the Association, is an address by Prof. J. A. Estey, Professor of Economics of Purdue University. Mr. Holly assigned to him the subject of "Business," and Prof. Estey informs me that that is a broad subject. He can go as far as he likes.

Prof. Estey: Mr. Chairman and Gentlemen: I am sure it is very kind of the Association to invite me to be here. I think of the story of the man who received from a friend a jar of peaches in brandy (that was some years ago). He wrote to the friend and said that he appreciated the peaches very much, but that he appreciated more the spirit in which they were sent. I feel the same way.

The subject of business is exceedingly broad, and the thought that occurred to me was this: Most people are interested in knowing, or speculating at any rate, when our present depression in business will come to an end, when prosperity will set in again, and similar questions, and I thought it might be worth while to put before you very briefly just what sources of information are available as to when the depression which we have suffered since January, 1920, will come to an end.

Of course, business forecasting is very dangerous. Anybody may undertake it, and, of course, it is more or less speculation, but it is possible in a general way to do a certain amount of business forecasting. That is what is generally called business cycles. That seems to be the only way we can make any estimate whatever as to just where we are; particularly, as to the questions

of when the depression has come to an end, when the period of good times will come to an end, and so on.

Doubtless, you are aware that statistically, the business of the United States, or of any country that is industrial, shows a very remarkable thing; that is, it fluctuates in waves, or goes round and round in what men call cycles. That is the history of the business of the United States in the last half century. There has been in a way a succession of these business cycles. And the business cycle is a well defined thing lasting sometimes three or four years, sometimes longer, and it consists of certain very well known periods. That is, you begin at the bottom in a period of depression. Business as a whole seems finally to climb out of that and get up to what we may call expansion and then to pass into the period of over-expansion almost invariably. We never seem to expand just the right amount, we always seem to go to the point of over-expansion, and when that becomes acute, there is a crisis like that of 1920, when business passes through a sort of storm and if very severe it may be accompanied by a bank failing, etc. When the crisis is over, we pass through a period, more or less prolonged, of depression, sometimes lasting a year two, or three. It would depend to a certain extent, I suppose, on the previous expansion, and after we have passed through that period of depression, certain readjustments are made, the over-inflation of business is cut down, a certain number of business failures occur, prices fall and wages fall.

After these readjustments are completed, then business begins to go up again toward the upper part of the cycle, through a recurrent period of expansion, and then it would seem when the expansion gets full headway it goes on once more to over-expansion and another crisis and around through another cycle. These are very well marked indeed, and in the period from 1871 to before the war, there were some thirteen of these cycles, very well marked indeed, all displaying the same characteristics, and when you approach this question of forecasting business and try to know what is going to happen next, or when a depression has come to an end, it is a study of the cycles, which seems to be the only way. Statistical agencies which make any calculations at all upon business base it upon a study of business cycles.

Now, just why business should go around such a curious performance as that is not very well understood, and there is no complete explanation of it. Many people assume it is the psyhology of the average business man; that he is in his normal moods an optimist. If he is not an optimist, somebody makes him an optimist. You don't have to organize optimist clubs in your business community. You get it any how in the course of events. Knockers are stepped on and you have to be a booster and here in business is that expansion and these are times when profits are more than ordinary and, as a rule, the expenses also, and some way or another business will begin to go beyond its normal boundaries, whatever that may mean, and that is generally accompanied by a very keen demand for bank funds. You will find generally a rising rate of interest and heavy diminution in the reserves kept by banks, and a great deal of new construction—business enthusing in a more permanent form —and there will be enventually a break, or, in other words, you reach the end of bank reserves; you cannot expand any more. As a rule, business expands in a kind of lopsided way, some goes ahead faster than others and when that happens the purchasing part of the community is diminished relatively and the market for the expanding businesses becomes restricted and for one reason and another it comes to an end and from that into this more or less acute depression which is called a crisis, such as the crisis of 1920.

In this last one of 1920, matters were made of course in a way worse by the external expansion due to the war; war purchases, contracts and war prices. Rising prices have passed. All of those things made for an unusually profitable condition and the expansion was exceedingly abnormal, and hence it would seem a more or less likely conclusion that the depression which follows an abnormal expansion would be in some way abnormal, more sudden or more profound while it lasted, it may not necessarily last long—to make up in intensity to some degree for the over-expansion.

The question which interests us is when will the depression we are now in, and which followed the crisis of 1920, come to an end and when shall we begin on that rise which is inevitable, if the history of the past is any indication. That, of course, is a difficult question. Statisticians do not pretend to do anything in the sense of predicting exactly when a depression will come to an end. It is very commonly asserted that the depression will come to an end when readjustments are made, but when they will be made no man can prophecy. It is generally believed by economists and those who base their judgment on the cycles of the past that these are things which must come about before we have any general rise. You may call them readjustments. In the first place it is held that prices must become stable and cease to fall, remain permanently at some level—they may never fall to the level previous to the war, I don't think they will ever get down to the level of before the war—but to a permanent level, stable level, before we shall enter into the period of expansion that seems to be necessary. and hence, if prices are still fluctuating, uncertain as to the bottom, have still some place to go, then the period is not over. It is also very commonly held that there

must be a reasonable relation in the level of all prices. That is, no particular price should show an abnormal relation to others. In the case of retail prices, they have not reflected the same fall as wholesale. This is necessary before the readjustment will be complete. Real estate has not revealed the fall that some other lines have. For instance, in the price of raw materials and finished products, if the one has fallen faster than the other—the raw materials generally fall first—then the finished products have to carry out their part of the performance before the readjustment is complete; and that is the sign, which one must watch for in business conditions. Each should have fallen more or less proportionately. Then, of course, that will affect the wages. The cost of manufacturing, including wages and cost of raw materials, must be proportionately low and therefore what one would expect to see all over the field is a reasonable fall in wages, whatever that may mean. None would argue that wages will fall in general back to the pre-war level. There is a resistive power, unconscious, perhaps, among unorganized labor, which is very hard to overcome, and hence you will find again and again in these cycles that wages go up on the rising part of the period and go down, but not as far nor to the point from which they started, and therefore, you may expect that in the readjustment of wages. Of course, your own particular line may fall as far as before, but in general, you will expect to see wages come down, but not as low as 1913, if history is any clue. I suppose this will account for the difference in costs, and, by the way, labor is not as efficient as it was before the war. The difference of cost other than wages must be made up I suppose by increasing efficiency on the part of the management. Perhaps you have seen the accounts given by engineers appointed by the American engineering societies, who will investigate waste of industry, and it appears there is a waste due to inefficient labor and mismanagement. Of course, that was increased during the war owing to the way that profits could be made and that must be eliminated and some increase in efficiency must be made also. Apparently, there is no liklihood that labor will come down to where it was in 1913, but it is not yet complete in the matter of wages.

Then, again, you would expect to see before we get out of this depression reasonable readjustments in the interest rates. The general beginning of the rise of business after depression is in some ways as much as anything else, due to cheap money, bank loans cheap, and above all you can get stocks and bonds at reasonable prices, and of course, both stocks and bonds have sold low for some time and therefore, you would expect to see falling and rising prices of stocks and bonds before the readjustment is complete. This is necessary to cause the general advance in business, and also, naturally, you would expect to see a real adjustment in railroad rates. Transportation costs are very peculiar. They rise slowly and it takes a good deal of maneuvering on the part of the railroads to get their rates up, and it takes a good deal more of maneuvering and legislation to get them down. At any rate, it will be more time before they come down. There is a petition now before the Interstate Commerce Commission which will be acted upon in the spring, in March, I suppose, to get them down, but that is an adjustment which must be made before the readjustments are complete.

And again, we would expect to see an adjustment take place in the matter of foreign trade and here we have a peculiar situation. The relation between foreign and home trade is all broken to pieces. There is the peculiar rate of exchange, which makes the American dollar worth four or five times that of those countries in Europe, both of the allies and enemy countries, and hence, we would suppose that some readjustment of these exchange rates would be essential before there is a complete recovery of foreign trade, and many people argue that foreign trade is so important. I don't think it is so important, but they think we should do something and do something very radical to put Europe on its feet; that is, to cancel our debts, or to go further and export a vaster amount of capital, that is, billions of dollars, in order to set the central European people on their feet. Of course, our export trade is lagging; the exporters would like to keep it up, but our export trade is only about seven to ten per cent of our general sales. The domestic trade is therefore, very large and its readjustment is therefore very necessary.

To carry through a complete survey, there will be certain readjustments, I suppose, relating to the government: taxes, tariff, government control. The taxes imposed during the war are a burden and will have to be cut down. These are readjustments that will have to take place. These are the things which are generally expected; they look for these readjustments to take place, and they argue when they have all taken place, then the depression is over and then business will begin to pick up and go upward in the scale, passing through the cycle again, and so on, in the usual course of events.

As far as I can see from the financial statistics and statements, we are not through that readjustment period. There are a great many which are only in process and are not completed. Financial people say that the process will be completed by next spring, so that we can start off 1922 with a booming business. Perhaps that may be so.

Now, if I may call attention to another aspect of this question. There are certain indications which statisticians and economists use to judge whether or not revival is beginning. How will you know what signs are there? What is the major thing, anyhow, in a business revival? Of course, you are having to take statisticians with certain reservations. There are only a general guide and any one statistical society taken alone is not of much use, but there are certain laws that all standard statisticians use and which is the means used by certain economic papers and financial journals. I refer to the business barometer, the production of pig iron which is the business barometer, and if you follow the Iron Age you can find out week by week what the production of pig iron is and it is generally held when it picks up extensively it is the sign of reviving business, pig iron being at the bass of construction business and it is therefore in great demand. Now, at the present time, pig iron is picking up and on the other hand it is lower than in any month of 1919 and any month of 1920.

The railroad gross earnings is a thing that is commonly used too to judge whether or not we are on the rise, because they carry all kinds of traffic, and, subject to the more or less fixed rate, give to their gross earnings a reasonable measure of certainty as to whether the country as a whole is picking up, and the same thing is true with the movement of freight cars. The number of idle cars—if they are diminished, will indicate that business is picking up.

The same thing is true of bank clearings as published by the papers. If the clearings in the country as a whole is expanding rapidly then business is picking up. They use the price of stocks—take say thirty or forty stocks, average their prices and try them on a chart, and if they show over long periods of time a gradual increase, it is generally a sign of mending business. Bonds are falling, getting better prices for bonds and more capi-

CLEVELAND, OHIO

tal easier. If there is lots of money idle and capital is cheap it is generally a sign that business is in position to pick up rapidly.

If you examine today—I am trying to put before you the only clues we have as far as we can see for estimating business conditions—if you examine today these various things, the output of pig iron, railroad gross receipts, movement of stocks and bonds, bank clearings, imports and exports, you will find this, that while there is a certain increase in bonds, it is not very large; that while there is right now a little increase in stocks, it has been overshadowed by a considerable fall; and while there is considerable increase in bank clearings, it is not the same as in previous years, and the same of pig iron orders and of the steel corporation, the purchase of copper is also used as an index by financial journals and economic experts. Many still argue we should not expect yet a very great increase in business prosperity, but perhaps we will get it in the spring when the uncertainty about the government is over and when the present relations between the nations of the world is permanently known and established, and the stabilizing of the exchange rates, and reduction in railroad rates; that we are still in the process of making readjustments.

I suppose most people agree that we cannot experience the usual profits of the war and the unusual possibilities which made the cycle of trade very high, with heavy fluctuations, without it being in some sort of a way the cause of—perhaps not all the cause—more or less continued depressions.

The average length of the depression would seem to be about sixteen months. I say there were sixteen cycles. The average time of rise will come in about twenty-two months, and the average time of depression will be about sixteen months, but then that is only an average. Many are short in duration and others last for three years; others are longer, seven or ten years. Therefore, you can't tell from the average length of these cycles how long the present one will last.

If I may conclude these rather scattered remarks—it seems to me anybody who is interested in the future investigation of business must not persuade himself he can prophesy with any exactness that these conditions are going to change. He can make a survey of things which must happen and which have been known to happen in the past before business conditions revive. I think we are still in the process of what men call—for lack of a better term—readjustments, and when we get out of that it will be because all of the adjustments have been made. Then we can expect the reviving of business.

A LUBRICANT THAT "STAYS PUT."

The problem of correct lubrication for steam and gas engines was undoubtedly solved long ago. Very high grade oils are used for the purpose of cylinder lubrication and great care is exercised in their manufacture, as well as caution in their application or use by the stationary engineer.

Therefore, the greatest amount of power is developed at the lowest possible cost, because care and attention is devoted to this important subject.

In too many cases this careful attention ends in the engine room; in other words, the factory machinery is often neglected, it being lubricated with any old oil or grease at irregular intervals.

In the case of gears, roller and link belt chains, just think how much money can be wasted by improper lubrication of these parts. They are equally as important in the successful operation of any plant as the engines themselves and specially prepared lubricants should be used on them exclusively, to insure economy and long life.

"Chainolene" lubricant was evolved after long experiments were made toward manufacturing a lubricant that would form a lasting oily film on fast moving frictional metal surfaces.

"Chainolene" has never failed to secure the approval of its users everywhere, when used for the lubrication of any kind of transmission gears, roller and link belt chains. It works its own way into every internal part of chains, thus preventing metal-to-metal contact, thereby insuring a smooth-running, anti-friction condition, resulting in the saving of power and longer life to the wearing parts. "Chainolene" stays put and lasts longer than any oil or grease on gear surfaces. It maintains its adhesive qualities indefinitely.

The consistency of "Chainolene" is a little heavier than vaseline; it is simple to use. It is made from a certain combination of pure Pennsylvania petroleum products and does not contain any graphite, acids or fats.

The Chainolene Mfg. Co. of Chicago, Ill., are proud to say that some of the largest ice cream plants in the country are satisfied users. Some of them say they like it especially, because it stays put and does not throw off the gears or chains onto their machinery.

"Chainolene" comes packed in 50-lb. cans, kegs, half and whole barrels.

A special offer is being made to any satisfactorily rated ice cream manufacturer on a ten-day trial basis, goods to be returned if not O. K., no charge for portion used, no shipping expense on return.

CUBAN ENGINEER INTERESTED IN AMERICAN EQUIPMENT.

The latest printed matter and catalogues of United States ice cream manufacturing equipment are finding their way to the refrigeration engineer and contractor, F. G. Robinson of Havana, Cuba. Cuba is a good field for ice cream business and the inhabitants are becoming more and more interested in this wholesome food as time progresses. Engineers are acquainting themselves with the best equipment made in this line, and the machinery manufactured in the United States is very favorably looked upon by them.

Does your business pay? If not, why keep it? Advertise it For Sale in The Ice Cream Review Want Department. Some one may be glad to buy it if they only knew it was for sale.

Condensed Milk and Milk Powder

(BY OTTO F. HUNZIKER)

THE THIRD EDITION of This Book Has Just Come from the Press.

This work represents a new book from cover to cover. It contains the description of the latest equipment and of the most improved methods and practices in the manufacture of every marketable line of condensed and dried milk products.

The More Outstanding New Features Are:

New methods for cooling sweetened condensed milk to prevent grittiness and sugar sediment.

New methods for sterilizing evaporated milk to prevent formation of a permanent curd.

Viscosity tests.

Condensing and drying of buttermilk by commercially practical methods.

The use of the Ruff Condenser.

Description of 20 different processes of desiccating milk by the dough-drying principle, the film-drying principle, and the spray-drying principle.

Detailed discussion of the commercial manufacture of powdered milk.

Cost of manufacture, composition solubility, properties, defects and keeping quality of milk powders.

All other chapters have been revised so as to make available such information as will be of the greatest service in the successful manufacture and marketing of condensed and dried milk products under the new and changed conditions of the industry.

The price of this new and enlarged volume is $5.75 per copy.

"HUTCHINSON'S" — CEDAR RAPIDS, IOWA

An Achievement in Ice Cream Plant Construction and Operation

"HUTCHINSON'S" is Cedar Rapids' newest ice cream factory. It is modern in its equipment —so thoroughly modern and attractive that a brief description should interest readers of The Ice Cream Review.

For the last few years the Hutchinson Company found their old plant not large enough to supply the demands of their many customers, and they have dreamed of an ideal—something that would not only supply their temporary needs, but one that could be easily made to double their present capacity if necessary.

Thereupon, Mr. Hutchinson, that dean of ice cream manufacturers in Iowa, called into consultation a firm of enterprising engineers and architects of his city—Hatton, Holmes and Anthony. He explained to them that he wanted an ice cream plant that would be capable of a lot of expansion, one that would be a cheerful place for the employes to work in, and the building must be an advertising asset to the company and a credit to the city of Cedar Rapids, Iowa.

With the word "go" these architects set out to design an ice cream plant with their characteristic bend for economy of operation, design and attractiveness. The illustration above is the outcome of their efforts and a great many consultations with Mr. Hutchinson, who wanted to be sure the final result would be in conformity with his visions of an ideal ice cream factory.

Prominently located on the corner of Third Street and Fifth Avenue is this two story building, built of red brick and concrete—a beauty to say the least. You cannot help but be attracted by the outward appearance of this building and be convinced of the progressive spirit it houses within.

As you pass into the main entrance you are attracted by the clean, sanitary appearance of the red concrete steps, blending in perfect harmony with the white walls.

Upon opening the inner door you find yourself in the main office. You would hardly think of an office. The soft tones of walls and floors, the harmonious furniture and ferns and growing flowers that ornament the window sills impress you more with the thought of your own living room. Here you are sure to be greeted with a hearty welcome by either Mr. F. D. Hutchinson, the general manager; Mr. J. S. McRaith, city sales manager; Mr. J. H. Borman, country sales manager, or the factory superintendent, Mr. L. R. Sanders.

These folks are all enthusiastic about their plant and an invitation to "go through" will be promptly forthcoming. So let us take a trip with one of these congenial gentlemen through this modern ice cream factory. We have provided an illustration of the ground floor plan so that you may trace your steps and get a better idea of the time saving arrangement of space at this plant.

From the office you pass directly through to the freezing room. Note from the illustration the sanitation that prevails here. The floor is of tile. The walls are also of tile up to the wainscoting. From here up the walls and ceiling are painted a peculiarly pleasing shade of light bluish gray. This color reflects a lot of light and has the advantage of not showing spots as readily as pure white. The battery of freezers stand out like an advance guard to arrest your immediate attention. They are Cherry freezers of the dreadnaught type, and equipped with Thomas automatic batch measures.

After you have finished your share of samples, you pass on to the can storage room. Here in one corner stands a sturdy ice cream can washer diligently working away, supplying clean, sanitary cans for the room through which you have just passed.

Now you climb one flight of stairs and enter the mixing room. You are at once impressed with the long row of seven glass enameled tanks for storage purposes. On the farther end of this large room you will find men dumping the sweet cream into a 600 gallon glass lined

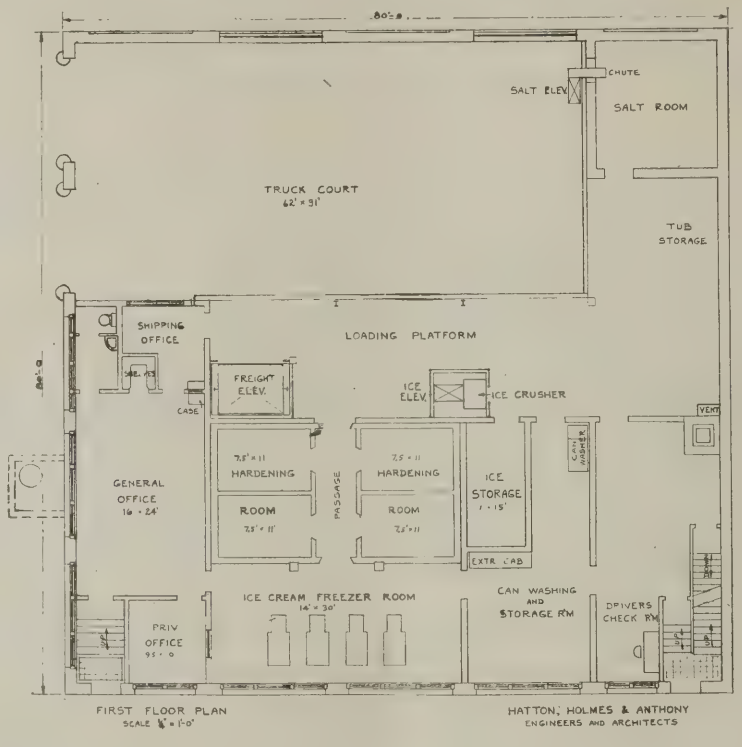
batch mixer. After proper mixing and pasteurization, the cream is drawn through sanitary piping, run through a 450-gallon per hour viscolizer, passed over a large tubular cooler and then pumped into the storage tanks shown in the illustration. After ageing from twelve to twenty-four hours, the cream is drawn through sanitary piping to the freezing room below.

At the end of this long row of tanks are two 40-quart freezers which are used for making brick ice cream only. This section is where the famous bricks are developed for the week-end "Specials" that have helped to create such a wonderful demand for Hutchinson's ice cream. Once you try some of these specials the taste lingers and the desire is for more. We know.



Your attention is directed to the refrigerating and hardening rooms in this plant. Bulk goods are handled on the first floor and bricks on the second. On the second floor is also provided cold storage space for fruit and raw cream as it is unloaded from the elevator.

After you have viewed this mixing room, noticed the adjoining spacious storage room for supplies, equally as inviting and sanitary as any other portion of the plant, the elevator boy calls "Going down" and you slowly drop two floors to the basement. Here you are attracted by the gentle hum of two twenty-five ton refrigerating machines. These supply the brine for the cooling and hardening rooms and also for the freezers. A double installation was provided to insure against shut-downs in the rush season.

Surprised is most everyone when entering the boiler room. The lack of soot leads one to inquire whether the boiler is not an "oil burner." You will be answered with a view into the coal bunkers, which are located under the large concrete loading platform within the enclosed court. A deep well engine pumps the water for the entire plant.

"Going up," says the elevator boy, and you step off on the loading platform, which opens onto the large enclosed turning space for the trucks, which, by the way, makes an ideal garage at night. Up comes one of the great white brine cooled trucks. It moves slowly along the loading platform, takes on its supply of ice cream, fills its bunkers with crushed ice from the ice chute that is supplied with the cracked ice by a large crusher, and passes on to the salt supply station which loads trucks in a similar manner.

This completes the trip through this modern factory; a credit to the industry; an asset the owners can be justly proud of and an achievement of the designers.

It is gratifying to know what rapid strides the Hutchinson Company has made in the development of the ice cream business in the middle west. This can best be illustrated by a hurried talk with one of their officers. This year the Cedar Rapids plants will produce more than two hundred and fifty thousand gallons of frozen product. Each of the five branches have an annual output of more than fifty thousand gallons which makes a grand total of more than a half million gallons.

The next thing you wonder about is how these branches are supplied. The raw sweet cream is shipped from a number of outlying creameries and from the most of these their entire sweet cream stock is annually consumed by the Cedar Rapids plant. How can this be possible? The mixing, viscolizing, and ageing is all done at the home plant and is then shipped in 10 gallon cans to the branches ready to freeze. The reason for handling in this manner is to insure a uniform mix at all times, thus resulting in a uniform product at both, branches and home plant.

The Hutchinson Co. invites everyone to visit their plant and this point is impressed on you as you shake hands for the last time and again find yourself outside.

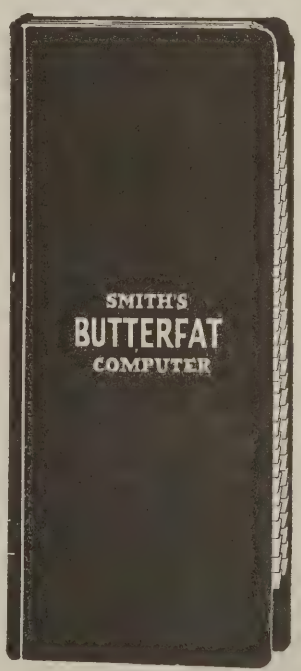
WHAT IS YOUR ANSWER?

A recent visitor at the offices of The Ice Cream Review, asked us the all important question, "What can I do to reduce my overhead expenses during the winter so that my winter business will not eat up all of my last summer's profits?" This man had several methods in mind, but before trying them out wanted to hear something of the experiences of others.

One of his methods was advertising. He is a firm believer in advertising, but he wants to know the best way to go about it in his particular circumstances. His, is a town in Louisiana, of about 15,000 population. The greater part of his make is sold in surrounding towns up to 75 miles distance. Advertising in the local newspaper is now being done, but it reaches only a small percentage of his customers. Advertising in the newspapers in all the towns, he says, is too costly, and circularizing the entire population in his distributing territory would also be very expensive.



Another thing he has in mind is introducing a side line that could be handled to good advantage in connection with his business.

If any readers of The Ice Cream Review solved this problem, or have tried to solve it, either with or without success, we would like to hear from them. An interesting discussion on this subject would be of benefit to all.

ANNUAL MEETING OF ASSOCIATION OF ICE CREAM SUPPLY MEN.

The annual meeting of the Association of Ice Cream Supply Men will be held in the McAlpin hotel, New York City, on Jan. 24th, 1922. A large attendance is desired. Make sure that a member of your firm is there.

You Need It In Your Business

If you have never used a Smith's Butterfat Computer you can't imagine what a big help it is. All drudgery of figuring and checking done away with.

In buying all kinds of farm produce it is indispensable to the man who has used it.

Just Turn Over a Page and There's the Answer.

It's the correct answer, too. We want you to have one. Send us $2.00 and we will put one in the mails for you at once, postage prepaid. Your money back any time within 10 days if you don't like it. Address:

LIGHTER EXPORTS REMOVE A SUPPORTING FACTOR IN CONDENSED AND EVAPORATED MILK MARKETS.

Neither domestic nor export demand have yet reached such a point as to relieve condensed and evaporated milk markets of the more or less dull condition which has prevailed throughout the past few months. Regardless of generally reduced prices on manufactured goods, business has not been up to expectations, and now with the first of the year at hand when inventories are in order, a still further factor has entered to temporarily slow up the movement. There has been a little buying going on for Russian relief purposes, although as yet no great volume of this has taken place, and accordingly the tone of the market has shown no change as a result of it. Exports during November dropped materially under those of the previous month, evaporated milk shipments being less than half of the amount which left the country in October. France, Germany and the United Kingdom continued to take the largest quantities of both condensed and evaporated goods, although shipments to parts of Russia materially increased. The immediate export outlook is said to be discouraging, for in this connection it is reported that there is considerable of an oversupply of both condensed and evaporated milk in England, and that some of this is being offered on the market for sale at prices lower than prices quoted in this country delivered seaboard. It is also reported that there are large unsold stocks in foreign countries of goods originally sent on consignment.

Selling Prices of Manufactured Product Lowered.

Advice from producing sections indicates that additional condensing plants may be closed after the first of the year. Some plants now in operation are utilizing the milk received for other products other than condensing, but the condition of butter markets which at present are unsettled and somewhat weakened on account of the relatively heavy current production and the outlook for imports, is not entirely satisfactory. December milk cost prices on the average were about the same as November, with a somewhat higher cost in parts of the New England section offset by reductions elsewhere. Prices received for manufactured goods were reduced about 50c lower per case during November.

A review of the accompanying statistics bears out the fact that the movement of goods has slowed up. The latest available export figures have already been referred to. December 1 stocks in manufacturers' hands were

some 9,000,000 lbs., or about 6 per cent heavier, as compared with November 1. Unsold stocks show even a larger comparative increase, amounting to 17,000,000 lbs., or approximately 14 per cent more on December 1 than the previous month.

RICE PARCHMENT COVERING FOR BRICK ICE CREAM.

Ice cream, wrapped in rice parchment, may be next introduced in the ice cream world. S. H. Berch, president of the Velvet Ice Cream Company, of Seattle, Wash., believes he has solved the problem of wrapping ice cream by rice parchment. He has applied for patents on his invention and has perfected the process so it is commercially practicable.

The rice parchment, which is manufactured in Holland, is made of pure rice; chemical analysis shows that it contains 90.49 per cent starch, 8.6 per cent moisture and .91 per cent ash. The wrapper can be eaten just as an ice cream cone. It is believed the new invention will increase the sales in ice cream.

THE KEYSTONE EXHIBIT.

Visitors to the convention held in Atlanta by the Southern Association of Ice Cream Manufacturers will recognize this handsome exhibit of The Keystone Fruit Products Co. of Cincinnati, Ohio.

The Keystone booth, in charge of Mr. M. B. Abrahams and Mr. Al. Isaacs, had the time of their lives keeping up with the constant procession of callers at their display and answering the host of questions about

the celebrated Keystone products. Handsome souvenirs in the shape of "Keystone" key chains and many packages of Keystone products were generously distributed, to all who called. Luckily the booth was well supplied and the big demand was taken care of.

The Keystone delegation reports that their efforts were more than appreciated and that a goodly quantity of orders was booked as their reward.

⚜

CISCO HAS ICE CREAM FUTURE.

Cisco, Texas, has good prospects for an ice cream plant, so Mr. Richardson, secretary of the Cisco Chamber of Commerce tells us. In his enthusiasm for his city he submits the following facts for the information of those who might be interested:

"Cisco is located on the main lines of the Texas & Pacific, the M. K. & T., and the Cisco & North Eastern Railroads. There are probably 100,000 people in Cisco's trade territory that could be reached by an ice cream factory here. Eastland county, in which Cisco is located, is now spending four and one-half million dollars on good roads. Cisco is now constructing a million dollar dam which will impound 15 billion gallons of water, and the lake will have a shoreline of 35 miles, and this will be developed into one of the largest summer resorts in the southwest. Cisco enjoys an ideal climate and ice cream is used extensively the year around. We will be glad to furnish complete information in detail to any one interested."

⚜

He: They tell me that your complexion is all made up.

He: That's what they meant.

Ice Cream with Chocolate Coating

wrapped in

Conley Foil

--an unbeatable combination

ARE you making chocolate-covered ice cream pies or bars? If not, you soon will be. For example, there's "Eskimo Pie," as introduced by the Russell Stover Company, Mallers Building, Chicago.

We will handle promptly your orders for pure Tin Foil wrappers, average size 5″ x 6″, printed in orange and purple, or any two colors you wish. As the largest Foil manufacturer in the world, we can make quick delivery at the right price.

Make a rough estimate of your possible wrapper requirements, basing it on the present winter-time average daily sale per dealer of forty-eight chocolate-coated ice cream bars. Then wire us, giving

1—Your imprint (name and address) exactly as you want it to appear.

2—Time of delivery.

3—Quantity wanted.

If a special cut is required, kindly send electrotype or a copy of the design. We will then put your order through at once and guarantee to have your name and address well displayed and correctly imprinted.

The new chocolate-coated ice cream confection is going strong. So is Conley Foil. The combination is unbeatable.

Cuscadens' Ice Cream Made in Louisville for Fifty Years

GEORGE W. CUSCADEN, Sr., who is known as "The Ice Cream King," came to Louisville from Cincinnati in 1866, more than fifty-five years ago. Louisville, Kentucky, then had a population of 65,000.

In 1871 Geo. W. Cuscaden and his mother opened a small confectionery and George made the ice cream. In those days, ice cream was made by hand, and only during the summer months, and none was packed or delivered to your home. All ice cream was made by turning the freezer around and around until the cream was frozen to a stiff batter; then it was beaten or whipped with a paddle. Thirty gallons was a big day's work for a man.

In 1880 the first ice cream machine was built. It was considered a wonder. It would make 20 gallons an hour.

In 1875 George Cuscaden opened one of the first ice cream factories in the United States. It was called an ice cream depot. It was a hard matter to educate the public to have ice cream sent home, but with a steady fight to win out, Mr. Cuscaden took to advertising through papers and circulars until his ice cream became known all over the state.

Geo. W. Cuscaden, Sr.

Geo. W. Cuscaden, Jr.

Arthur B. Cuscaden.

He was the first man to ever ship ice cream on railroads and one of the very first to sell ice cream soda water.

In the olden days Mr. Cuscaden shipped ice cream as far as Virginia, down into Tennessee and all over Indiana. But today there are ice cream factories in almost every small town from coast to coast. Today the ice cream business has become one of the biggest commercial industries of the country. There have been inventions of machinery for handling milk, cream and ice cream and today the farmers ship thousands of gallons of milk and cream on railroads. There was very little milk shipped on railroads forty-five years ago, and no machinery of any kind to handle it. There was no such thing as pasteurizing milk and cream.

In 1899 Geo. F. Cuscaden invented a machine for making ice cream bricks in four colors and flavors. He had this machine patented and continued to use it for more than twenty years, up until a year ago, when the Cuscaden Ice Cream Works discontinued the four-flavor brick, during which time it made thousands of gallons of brick ice cream.

The manufacturing growth of ice cream has been remarkable when you consider that fifty years ago, when ice cream was a luxury, Mr. Cuscaden made from five to ten gallons a day, and now the same plant, with its additional facilities, can make more than 3,000 gallons per day. Mr. Cuscaden always kept his ear to the ground and when there was anything new to be brought out in the ice cream business, he was one of the first to see it and had the ability to develop it.

Today the Cuscaden Ice Cream Works, Inc., is operated and managed by Arthur and Harry A. Cuscaden. George Cuscaden, Sr., has practically retired. George Cuscaden, Jr., owns and operates a retail business known as Cuscaden's Confectionery.

Harry A. Cuscaden.

Harry A. Cuscaden answers the oft-asked question, "What is the Cuscaden nationality?" in this manner, "We are Irish and are proud of it, and green is our standardized color on our tubs, trucks and equipment."

The plant is equipped with a York compressor, Emery Thompson freezers, Progress homogenizer, and Standard Milk Machinery Co. vats.

Thus in referring to the history of the Cuscaden Ice Cream Company we might add, "From a Small Acorn a Large Tree Did Grow." Harry A. Cuscaden has been working for some time on a small booklet containing the history of the Cuscaden Ice Cream Works and it will be illustrated with pictures of the business from its beginning.

MERGER OF ICE CREAM AND MILK COMPANIES ANNOUNCED.

The merger of two of Los Angeles industries was announced recently by O. R. Lee, president of the Consumers' Milk Company, when he stated that the Globe A1 Ice Cream Company and the Consumers' Milk Company had joined hands.

"It is a great move," said Mr. Lee, president of the milk company, "and by a consolidation will reach the cost of overhead for both companies."

The ice cream company was incorporated recently for $1,000,000 and has as two of its directors, W. E. Keller and A. A. Comey, besides having back of it six millionaires, men who are well known in national and business interests.

The ice cream company will furnish both steam and refrigeration to the milk company. The truck which delivers milk to the dealers will also carry ice cream, thus cutting down on the delivery system.

Two other ice cream companies under this same management, one in Oakland and the other in San Francisco, will begin manufacturing ice cream immediately.

The ice cream factory will commence with an output of 1,000,000 gallons of ice cream a year, and the ice plant will manufacture 250 tons of ice a day. The Consumers Milk Company willl have a production of 8000 gallons a day.

Mr. Comey, the general manager of the ice cream plant, stated that the factory would turn out a better grade of ice cream for Los Angeles and with the reduced cost of overhead and efficient management it would be possible to lower the cost to wholesale dealers.—Los Angeles (Calif.) Express.

DAIRYMEN'S MFG. & SUPPLY CO.

403 North Main St. ST. LOUIS, MO.

B. Riley Hauk
President

TO MEMBERS OF THE NATIONAL DAIRY ASSOCIATION.

The annual meeting of the board of directors of the National Dairy Association was held in Chicago on Thursday evening, December 1st, and the member's annual meeting was held on Friday, December 2nd, in accordance with calls issued.

The new board of directors held its first meeting immediately following the close of the members' meeting on the afternoon of the second, at which time officers for the ensuing year were elected as follows: H. E. Van Norman, president; G. Watson French, vice-president; J. A. Walker, vice-president and treasurer; W. E. Skinner, secretary and general manager.

The executive committee for the year was named by the president as follows: J. K. Dering, W. W. Marsh, Chas. L. Hill, M. D. Munn, Hugh G. Van Pelt, J. D. Hollowell, Walter L. Cherry with president and two vice-presidents ex-officio members).

The committee named at the last annual meeting to consider the matter of increasing the number of directors made a report recommending that the number of directors be raised from 27 to 33 in order to give more even representation to the various branches of the industry and to keep pace with the increasing membership. The directorate is now filled as follows: G. Watson French, W. S. Moscrip, Frank O. Lowden, Fred Pabst, W. W. Marsh, Chas. L. Hill, F. K. Babson, Robert Scoville, J. K. Dering, M. D. Munn, Hugh G. Van Pelt, Nelle Fabyan, Paul O. Reymann, Hugh J. Chisholm, Frank Wills, E. M. Bailey, John LeFeber, J. A. Walker, T. H. McInerney, John T. Cunningham, M. J. Norton, C. W. Larson, H. E. Van Norman, H. H. Kildee, F. J. Macnish, E. W. Chandler, W. C. Davis, E. G. Miner, John D. Hollowell, C. M. Burdette, Walter L. Cherry, A. J. Glover, W. E. Skinner.

At the directors' meeting on Thursday evening President Van Norman presided and there were seventeen directors present. The minutes of the last annual meeting were read and approved. Two committees named at the 1920 meeting reported in favor of the increase in directorate, and progress in matters concerning the World's Dairy Congress which is to be held in this country in 1923. The secretary's report showed attendance at this year's show as being 100 per cent from the industry, the shortage of gate receipts being due to lack of city attendance because business interests of the twin cities failed to get the support of their people to back their promises of attendance. This they promise to do, backed by a guarantee, if we go back next year.

Provision for making classes in the show for calves owned by boys and girls in calf clubs was adopted and a committee appointed to work out details. The matter of increasing grade cattle exhibits was approved and the manager was requested to develop more activity in this direction through the cattle clubs. The matter of reducing group exhibits and cutting out junior calves, and developing futurity classes in the show, was discussed and referred to a reclassification committee to be appointed to review all cattle classes. The purebred bull campaign was approved and the manager was requested to develop a one-price bull sale of all breeds at the show each year.

The question of displaying all of the features connected with dairying—farm, factory, milk plant—in an attractive, informative way as entertainment for visitor as well as education, was approved.

The matter of a central home for the association was reported on by the chairman of the "Own Home" Committee as still being worked on with some chance of bringing it to accomplishment.

The report of the treasurer on the year's operations was read and approved, and copy of balance sheet is attached hereto.

Some comment was made as to the machinery men desiring to change the period of holding the show to every other year. Action was left to conference between machinery men and show management.

Delegations from Minnesota, Indiana and Kentucky, desiring to convey an invitation for the 1922 show to come to their states, were heard and a committee named to go over the proposals and facilities. The cities tendering invitations by delegates were Louisville, Indianapolis, and St. Paul and Minneapolis. Macon, Ga., Memphis, Tenn., and Richmond, Va., sent invitations by mail. The executive committee is to determine where the show shall be held, after hearing report by the president and secretary.

If you were not present you missed much valuable discussion on many subjects of dairy interest that only those present enjoyed. It is hoped that you will make a promise to yourself that you will always attend the annual meetings and give the industry the benefit of your experience and wisdom in conducting the work of this great association in such a manner as to cause it to reach its fullest measure of service to the industry.

Yours very truly,

W. E. SKINNER, Secretary.

OKLAHOMA ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 80)

Afternoon Session, Dec. 13, 1921.

Prof. A. D. Burke, Stillwater, Okla., spoke on the "Food Value of Gelatine."

ADDRESS BY PROF. A. D. BURKE, A. & M. COLLEGE, STILLWATER, OKLAHOMA.

To the Ice Cream Manufacturers of Oklahoma.

The Food Value of Gelatine.

Gelatine occupies a unique position in the ice cream world. It holds a distinct place on its side of the fence, and as yet no gums, powders, or any substitutes have been able to take its place and get over the fence with it, at least, not in one particular, namely, food value.

A few weeks ago a certain chemist claimed that gelatine was no longer looked upon as a food, in the true sense of the word. Perhaps he is right; perhaps not. I prefer to think the latter, for as one writer states, "It is certainly not by accident that the people of France turned to gelatine as a substitute for meat during the seige of Paris in 1870-71."

At least something of the use and nature of gelatine was undoubtedly known as early as 1700, for a European, Genys Papin, by name, in 1861, prepared it from bones under pressure, and from that time on it was made and used in Europe, especially in France, where its employment in hospitals and hotels became quite general.

Then experimenters, as is always the case when any new material comes to light, began to plunge into a study of its secrets and learn its true value. Chemists analyzed its composition and found that some grades contained such impurities as arsenic, copper, chlorides, sulphides and other materials, whcih they claimed made all but the highest grades unsuitable for use as food, and indeed their claim was probably true, for not so very long ago one worker at least, claims to have found copper present in some samples in sufficient quantities "to cause poisoning when the gelatine was used to garnish beef."

You, yourselves, and I likewise, although I am not so very old, have seen the day when physicians and some dietitions, and almost anyone who wrote on the subject of the healthfulness of ice cream, frequently condemned the use of gelatine on the grounds that the poorer grades oft times contained germs of disease, because as the writers claimed, they might have been manufactured unknowingly from diseased carcasses. Furthermore the word was passed around that practically all gelatine, if disease germs were not present, at least contained a sufficient number of undesirable germs to make its use unsatisfactory for ice cream making. In fact I know of a number of bacteriological analysis which showed gelatine to contain upwards of 2,000,000 germs per gram. I mysèlf have found varying numbers of bacteria, some samples running as high as 9,000,000 germs per gram. Think what that means to your ice cream if you use it in the mix. Think what it might mean to health. Such material at best could not be considered a very satisfactory edible product.

But do you know how the germs got in that gelatine? Carlessness and lack of knowledge on the part of the manufacturer who sent it to me. Gelatine you all realize is a glue, but of course the very purest type of glue, naturally it has a glue consistency.

Exposure to air, or dust, therefore, leads to contamination, and it behooves the maker of gelatine to use some care in packing his product for shipment, for not all ice cream makers pasteurize gelatine along with

the mix, and even if they do, a clean product should be demanded.

If any gelatine makers are present they have probably begun to squirm, but they needn't, for I want to say right here and now, that most of the gelatine on the market, at the present time goes to the packing room practically if not absolutely sterile, and the manufecturer and ice cream maker should be interested in keeping it so.

Contamination not only detracts from the food value but frequently injures the product, and at best is not conducive to the making of a first class mix.

The other day I received ten 5-pound lots of gelatine, shipped from clear across the United States. The greatest number of germs any sample contained was 2,000 per gram. That gelatine firm knew how to pack and ship the product. So you see under the present methods of manufacture all standard makes of gelatine should be nearly sterile.

Now as regards the impurities that gelatine may contain. I have mentioned a number, such as copper, arsenic, sulphides, etc. An analysis from a well known standard firm shows the following:

Copper—less than 30 parts per million.
Lead—less than 10 parts per million.
Zinc—less than 100 parts per million.
Arsenic—less than 2.4 parts per million.
Sulphur—less than 350 parts per million.
Dioxide

Think what a very small amount of impurities this gelatine contains, and the reason lies in the fact that only the purest of chemicals are used in its preparation, because most of the impurities that gelatine does contain, comes from the chemicals used in its manufacture. Such small amounts of foreign substances as above, could, at least, cause no detrimental effects, and might be considered a negligible quantity.

And right here is another point for the ice cream maker to remember: "Be sure your gelatine is pure, chemically as well as bacteriologically." You have a right to demand its analysis from the manufacturer, and I suggest you do so in order that we keep the gelatine which is now on the market up to its present high standard of quality.

Thus we have come to see that a good gelatine is, as a rule, nearly pure, and purity is a primary prerequisite to a high food value.

(Continued in next issue)

The man who is careless enough to lose his temper ought not to be trusted with other people's belongings.

RETROSPECT AND PROSPECT.

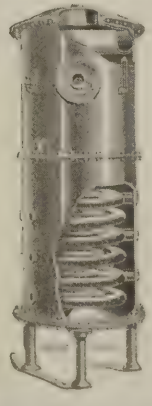
Bulletin No. 2 of the North Carolina Ice Cream Manufacturers' Association.

The ending of the year just passed has caused many a sigh of relief,—1921 was a year which will be long remembered and hard to forget. Still it was beneficial in that the problems furnished will be guide posts for 1922 and the old mistakes can be avoided. The dawn of the new year is bright with hope and promise which we trust will not be disappointing.

Gathering up the threads of the holiday we find the repeal of the tax on ice cream which is most encouraging and should stimulate the trade. Another thing that should have a stimulating effect is the tax on soft drinks which the manufacturers are supposed to assume, but which they are disposed to put on the retailer. For instance, a druggist showed the writer an invoice for cocoa cola dated Jan. 1st on which he stated the price had been increased, making him bear the tax, the tax having been added by the manufacturer to the jobber, who in turn passed it to the retailer. This druggist stated he would have to either increase his price to the consumer or reduce the size of the drink served to seven ounces. If this is generally followed the consumption of ice cream will be increased. So if we look we will find many things that may help us, and instead of turning our thoughts to the difficulties of 1921, let us use the solution of them for 1922, and put forth every effort to make this the brightest year in the history of the trade.

Wisconsin Ice Cream Manufacturers:

Let's pull together and get every ice cream manufacturer to attend our convention this year. Make this year a record breaker. The Badger Flyers are working hard to help us put it over. Every member should do his part. A good time is assured.



D. D. SMITH, President,
Wisconsin Assn. of Ice Cream Mfrs.

The writer is most thankful for the nice remembrance Christmas and wishes to thank each member individually for it. It is a pleasure to be of service to all of you, and if there is anything you want done at any time, wire or phone me, and it will be accomplished if possbile.

Sincerely,
A. E. DIXON, Secretary.

Let's push the membership to 50 for 1922.

People who commit suicide have a correct idea of their value to the world.

TEXAS LONGHORNS

President—J. R. KRAMER, Creamery Package Mfg. Co., Dallas, Texas.

Secretary—J. B. HUFF, Prall-Huff Co., Fort Worth, Texas.

No, dear reader, this is not a new department instituted in honor of a new organization. "The Texas Longhorns" is the new name for an old organization—The Texas Association of Ice Cream Supply Men. How do you like it? So do we.

By the way, what do you think of the longhorn—brand and all— selected as the symbol of the organization? Carl Zimmer, the popular and good looking representative of the Menasha Printing & Carton Co., Kansas City, insisted upon the honor and privilege of selecting this symbol and furnished, without cost to the organization, the cut which will appear regularly at the head of this department. Now it is up to the rest of you Longhorns to keep us supplied with news to publish under this symbol.

The Longhorns, in customary Texas style, entertained the ice cream manufacturers at the Fort Worth convention with satisfaction to all concerned. Secretary J. B. Huff was a busy man all the time and did the job so well that he was retained for another year.

At the business session the following officers were elected for 1922:

President—J. R. Kramer, Care Creamery Package Manufacturing Co., Dallas, Texas.

Secretary—J. B. Huff, care Prall-Huff Co., Fort Worth, Texas.

Considerable discussion preceded the vote on change of names of the organization. There was no sentiment in favor of retaining the old name, but there was a division of sentiment regarding the new. M. S. Pennybacker made a wonderful speech, replete with adjectives and reminiscences of his days as a pioneer in the southwestern country, and he bitterly opposed the suggestion to change the name to Texas Steers. A committee consisting of Messrs. Peale, Miller, Zimmer and Owens, was appointed to decide upon the name and report at an adjourned meeting. The report of the committee favored the name "Texas Steers," which brought forth another impassioned speech by Mr. Pennybacker. The final vote was unanimous for "Texas Longhorns" and thus the organization will be known for all time without doubt. We are suspicious that the committee was "spoofing" Mr. P., but he was happy anyway.

TENNESSEE CONVENTION, FEB. 7TH.

Just as we go to press we receive word that the Tennessee Association of Ice Cream Manufacturers will meet in annual convention in Nashville on Tuesday, Jan. 17th. Mr. W. M. Sidebottom, 145 Sixth Ave., No. Nashville, is president, and Geo. A. Decker, care John Decker & Son, Nashville, is secretary.

A BEAUTIFUL SOUVENIR.

This office is in receipt of a beautiful souvenir metal calendar, which stands upright on our desk, and which came from The McCormick Company, Inc., of Pittsburgh and New York City. It is a very practical reminder of the firm which advertises as "architects and engineers for the dairy and ice cream industry." Thanks, folks.

Ohio Ice Cream Manufacturers' Ass'n Convention at Columbus

Success and conventions go hand in hand. This year the annual convention of the Ohio Association of Ice Cream Manufacturers will be held at Columbus in the Deshler hotel on January 31st and February 1st.

The world war has brought about conditions, which in turn have brought up problems which cannot well be solved by individuals. There are problems which require discussion by the best informed figures in the ice cream business to secure the answer which will be most beneficial to all concerned. These problems cannot be met satisfactorily by hammering away at them alone, but they require the combined efforts of men engaged in the ice cream business in various sections and who have recognized these problems from different angles, or who have seemingly devolved practical solutions of them of their own.

It is important that the ice cream manufacturers attend as many of these conventions as possible. The Ohio convention has always been largely attended but we feel that in particular this year—a year of reconstruction—it is more important than ever that you make it a point to attend at least your state convention. It is the place to learn how to overcome excessive operating expense, excessive delivery expense, how to increase the consumption of ice cream where the consumption has apparently already reached its maximum, how to help the consuming public to realize the real food value of ice cream and its relative value compared to the cost of other foods—the conventions are the places for discussions such as these—come and profit by the other fellow's methods.

The Hotel Deshler, which is to be the convention headquarters, is one of the most beautifully appointed hotels in the United States. You will enjoy its atmosphere and vote the service the best. The management is preparing to entertain you in large numbers and you can make it a little vacation trip to be enjoyed before the coming season's rush. There will be evening entertainments and the Ohio Ice Cream Manufacturers' Association promises to see that all attending have a good time.

In this age, when competition is so keen and when the public has been educated to such a thorough appreciation of quality ice cream and how this ice cream is handled, it behooves the wide awake manufacturre to consider attendance at his state convention as important and necessary to his own welfare. The progressive ice cream manufacturer realizes that he must keep in close touch with the new equipment and the new methods as they come on to the market—to do this he attends conventions and carefully reads his trade papers. Columbus is inviting us to attend this Ohio state convention of ice cream manufacturers—we are going, manufacturers and supply men will all be there. It is our pride. It is our opportunity to draw upon that annual treasury of ideas. It is our business father and our helpful big brother. It is our dynamo for recharging the batteries of knowledge and power and we must not overlook our chance to invest in a little more power. The Ohio convention will be a veritable storehouse of ideas and a builder of ideals. You must attend to catch its enthusiasm and its value lies in what you seek of it and how well you learn the answer. Enthusiasm is born of a crowd—it is to be your crowd, your business, your pride, and above all—your opportunity.

For illustration as to the importance of attending the convention let us call to your attention the country store, back from the beaten paths of business where you find that a modernly equipped store with up-to-date stock is an exception rather than a rule. The reason is obvious—isolated from the hum and bustle of broad-gauged business, the proprietor is out of touch with the contagious enthusiasm radiating from big accomplishments, and unless he ties himself often to the center of things, his business soon lacks the stimulating effect of new methods and soon saps its own strength and figuratively speaking, is a "dead one." Moral: Get out and interview other business men—it makes even BIG men bigger and better—equip yourself with practical proven business methods of the latest pattern from which you can derive new and perfect ideas to strengthen your business with, and you wideawake ice cream manufacturer must mingle freely with others in your own field and elsewhere as often as possible. Start in right by attending this Ohio state convention—there isn't a better place to start the convention habit. Fortify your business for the coming year by hiking Columbusward! Conventions are the timekeepers of progress and have claimed an important position in our commercial development. No man in the ice cream business can leave the convention without a considerable addition to his store of knowledge and an extension upon the breadth of his outlook.

Columbus is a city of about 237,000 population and is an ideal convention city—it was the home of the National Dairy Show in the years of 1917-1918.

Your attendance is of no small consequence to the ice cream manufacturers of Ohio—they are holding this convention for your benefit—let us not disappoint them by remaining away—MEET US IN COLUMBUS January 31st and February 1st.

MISSISSIPPI CONVENTION, JAN. 16-17.

The Fourth Annual Convention of the Mississippi Ice Cream Manufacturers' Association will be held in the Edwards Hotel, Jackson, Miss., on Monday and Tuesday, January 16 and 17, 1922. The officers, President P. L. Farrell, of Brookhaven, and Secretary-Treasurer N. D. Brookshire, of Meriden, have prepared a splendid program as follows:

January 16, 1922.

Registration.
Report of Secretary-Treasurer.
President's Address.
Re-Icing of Ice Cream by the Manufacturer.....S. N. Sutton
Vicksburg, Miss.
The Cream and Milk Outlook for 1922.....D. S. Cox, Jr.
Columbus, Miss.
Will Collective Advertising Benefit Our Industry..W. D. Seale
Jackson, Miss.
Eternal Triangle, Manufacturer-Retailer-Consumer...
.....A. A. McLeren
Clarksdale, Miss.

January 17th, 1922.

Address .....W. W. Campbell
President, Southern Ice Cream Manufacturers Assn.,
Shrevesport, La.
Food Value of Ice Cream.....E. R. Harris
Hattiesburg, Miss.
Co-operation Between the Inspector and the Manufacturer .....P. C. Cromer
State Creamery and Dairy Inspector, Jackson, Miss.
Constructive Association Membership.....C. A. Kent
Kentwood, La.
Best Methods of Collecting Ice Cream Accounts.....
.....H. G. Duttlinger
Memphis, Tenn.
Luncheon.
Business Meeting for Members Only.
Report of Committees.
New Business.
Election of Officers.

TENTATIVE PROGRAM FOR THE IOWA ICE CREAM MANUFACTURERS' CONVENTION, CEDAR RAPIDS, IA., JAN. 24 AND 25.

Jan. 24, 1922.

Visiting the Hutchinson Ice Cream Plant, where display of fancy ice cream and the making of the same will be held.
Meeting of the Board of Directors and also Registration of members.
Address of Welcome.
Response.
President's Address.
Reports of Secretary and Treasurer.
Address by W. B. Barney, Dairy and Food Commissioner.
Address by Prof. Mortensen, Iowa State College.
Reports of Standing Committees.

Evening.

Annual Banquet and entertainment by the Poodle Dogs.

Jan. 25, 1922.

Address by Prof. Washburn.
Continuation of Reports of Committees and Discussions.
Adjourn to J. G. Cherry factory for luncheon and inspection of the plant.
Second Address by Prof. Washburn.
Final Reports of Committees.
Election of Officers, etc.

DON'T FORGET KANSAS.

Remember that the postponed convention of the Kansas Association of Ice Cream Manufacturers will be held at the Baltimore hotel, Kansas City, Mo., on Thursday and Friday, Jan. 26th and 27th. If you had your grip sack all packed to go and then had to unpack it don't let that discourage you.

Please remember that the several pages of publicity which we gave the Kansas convention in the November issue all apply with equal force to the postponed convention. The Jack Rabbits will all be there and promise you a "hopping" good time. Don't miss it.

National Association of Ice Cream Manufacturers

Bulletin No. 48.

TO THE MEMBERS:

1921 Revenue Bill.

Herewith is presented an interpretation of such portions of the 1921 Revenue Bill as it is thought are of importance to Ice Cream Manufacturers:

SOFT DRINKS: Sections 628 and 630 repealed, effective January 1, 1922.

For the taxes now provided under these sections (on ice cream, ice cream sodas, soft drinks, cereal beverages, etc.), the bill provides, effective January 1, 1922, a tax of 2c a gallon upon (1) cereal beverages and substitutes, (2) unfermented fruit juices (as distinguished from fountain syrups) used for beverage purposes, (3) carbonated beverages known as soft drinks, (4) still drinks intended for consumption in the form in which sold, and (5) natural or artificial mineral waters, including imitations, sold by the producer, bottler or importer in bottles or closed containers at over 12½c a gallon; upon fountain syrups (including syrups made by manufacturers of carbonated beverages, or proprietors of ice cream parlors), 9c a gallon.

This tax would not apply on fountain syrups sold for use in the manufacture of cereal beverages and still drinks subject to the tax of 2c per gallon mentioned above; but when sold to be used in the manufacture of carbonated bottled beverages the tax is 5c a gallon.

Upon carbonic acid gas sold (1) to manufacturers of carbonated beverages, (2) to persons conducting soda fountains and ice cream parlors, and (3) carbonic acid gas used by producers, or importers thereof in preparation of soft drinks, there would be a tax of 4c a pound.

The foregoing are manufacturers' taxes, as to which returns would be made monthly, under oath, by the manufacturer, producer or importer, under a penalty of 5%, with interest at 1% monthly for delay.

Persons required to pay taxes under this title would be required to keep posted on their premises a certificate stating that they have registered in accordance with the regulation of the department.

EXCESS PROFITS TAXES: The repeal of these taxes is effective January 1, 1922, but the repeal does not apply to 1921 business, returns on which must be filed as heretofore.

Income Taxes.

Surtaxes on Individual Incomes: Effective for the calendar year 1922 and thereafter surtaxes on individual incomes would range as high as 50% on net income in excess of $200,000. These surtaxes would begin at 1% on $6,000 to $10,000, increase by 1% for each $2,000 of net income (except on $20,000 to $22,000, on which the rate would be 8%, and $32,000 to $36,000, on which the rate would be 15%) to 47% on $98,000 to $100,000, continuing at 48% on $100,000 to $150,000, 49% on $150,000 to $200,000, and 50% on net income in excess of that figure.

Returns: To the present requirement for returns is added a provision that any one with a gross income of $5,000 or more, whatever his net income, is to file a return. Corporate returns are to include such statements as will enable the commissioner to determine earnings or profits during the taxable year which have been distributed to stockholders during such year.

Personal Exemptions are changed in the case of the head of a family when net income is $5,000 or less, being increased to $2,500, and in the case of all taxpayers being increased to $400 for each dependent. Where the head of a family or a married person is living with husband or wife, the normal tax is not to exceed the tax on a net income of $5,000 plus the excess of net income over that figure for the taxable year. The reduction of the exemption from $2,500 to $2,000 would not operate to increase the tax payable under the higher exemption by more than the amount of net income in excess of $5,000. The status of a person as single or married, etc., is to be determined by his situation on the last day of the taxable year; in the event of death, the status is fixed at the time of death, except that a surviving spouse will be entitled to full credits for the whole year.

Traveling Expenses: Section 214 provides that in computing net income there shall be allowed as deductions traveling expenses (including the entire amount expended for meals and lodging) while away from home in the pursuit of a trade or business.

Partnership Returns: Section 224 provides that every partnership shall make a return, stating specifically the items of its gross income and the deductions allowed by this title, and shall include in the return the names and addresses of the individuals who would be entitled to share in the net income if distributed and the amount of the distributive share of each individual. The return shall be sworn to by one of the partners.

Corporation Rate: For 1922 and following years the rate is placed at 12½ of net income remaining after deduction of $2,000, the latter to be allowed only to corporations having a net income of $25,000 or less. Where the net income is over $25,000 the denial of the exemption is not operative to increase the tax which would be payable without the exemption by more than the net income in excess of $25,000. This provision might be availed of in computing net income of "affiliated" corporations.

Holding Companies or Other Corporations, if devised or used to prevent imposition of surtaxes upon shareholders, have their penalties increased by a tax of 25% of their net income. Stockholders in such a company may, if all agree, be treated like partners and each assessed with income tax upon his distributive share of the corporation's net income. In this event, the corporation will be free of tax.

Capital Gain and Capial Loss: A new section is inserted in the law to deal with capital gains and losses of individuals. Capital gain means taxable gain from the sale or exchange of capital assets at any time after December 31, 1921. Capital assets include any property acquired and held for investment, but not stock in trade or other property which would be included in the taxpayer's inventory. Individuals are to report separately their ordinary net income and their capital net gain and upon the former are to pay at the regular rates on individuals' income, but on the latter are to pay 12½%. In no such case where there is a net capital gain is the total tax paid to be less than 12½% of total net income. At the election of the taxpayer capital gain might be taxed as net income under Sections 210 and 211.

Sales to Record Losses: No deduction from gross income is allowed because of loss incurred through sale of stock or other securities if it appears that within 30 days of the sale the taxpayer, otherwise than by bequest or inheritance, acquired identical property in practically the same amount which is held and not disposed of. An exception is made upon behalf of dealers in securities, who claim losses incurred in the ordinary course of their

business. If the new acquisition is only partly in identical property, the deductible loss may be the portion corresponding to the balance. When a loss cannot be deducted under this provision, the property acquired with relation to which such loss is disallowed is to be treated as replacing the property sold.

Inspection of Books: No taxpayer is to be subject to unnecessary examinations or investigations in connection with income or other taxes. Unless the taxpayer makes a request, or the commissioner of internal revenue gives special notice of necessity, books may not be examined more than once a year.

Other Taxes.

Transportation Taxes: Effective January 1, 1922, the taxes on transportation of freight, express and passengers, sleeping car and parlor car accommodations, berths and staterooms, as well as the parcel post tax, would be repealed. The tax on telephone and telegraph service would remain unchanged. The Commissioner of Internal Revenue would by regulation arrange for the refund of tax on unused portions of mileage books and tickets for passenger service.

The Capital Stock Tax is retained as under the 1918 Act.

Address all communications to P. N. MILLER, Jr., Secretary, 2913 11th Avenue, Birmingham, Ala.

Minutes of Annual Meeting.

The annual meeting of the Dixie Flyers was held at 11 A. M., November 29th, in the reception room of the auditorium, Atlanta, Ga. Various discussions as to entertainment after which the election of officers took place.

The nominating committee, composed of L. H. Evers, Frank Wright, Adolph Skinner and H. P. Olsen, nominated the following officers:

President—B. B. Scott.

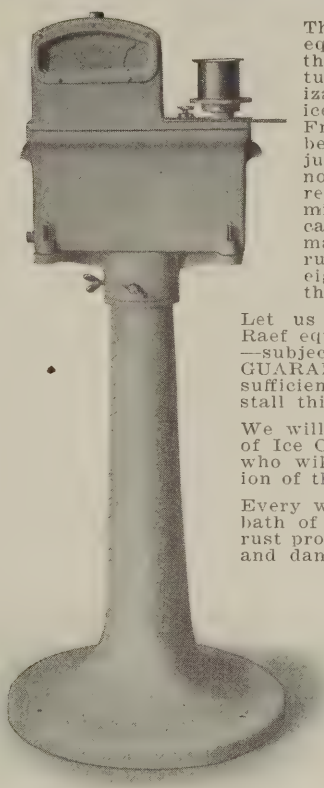
Vice-President—Adolph Skinner.

Secretary-Treasurer—P. N. Miller, Jr.

Directors—J. W. Mulligan, S. H. Alston, Roy Jennings, C. B. Hostetter, Thomas J. Stewart.

Motion made and carried that secretary cast ballot.

The newly elected president, Mr. Scott, appointed the following entertainment committee for 1922:



Thomas J. Stewart, chairman, Cincinnati, Ohio; Frederick W. Hooten, Nashville, Tenn.; Dr. Ben H. Brown, Chattanooga, Tenn.; Byron Morris, Chicago, Ill.; Mrs. Ruby Marnette, Atlanta, Ga.

Votes of thanks were extended to the officers, directors and entertainment committee, and also to Mrs. Marnette for their efficient work during the year.

Particular thanks were extended to Mr. Everett, Mrs. Marnette and the secretary who were in Atlanta several days in advance getting the affair into shape.

The dance and lunch held Tuesday night were highly complimented and the Dixie Flyers then adjourned for another year.

DE RAEF Ice Cream Weight Standardizer

The only patented equipment offered to the ice cream manufacturer for the Standardization of all makes of ice cream — Vanilla — Fruit — Nut — Sherbets—without any adjustments of any kind—no charts—no weights regardless of weight of mix—making it practical in any plant, to make an entire day's run and not to vary an eighth of a pound to the gallon.

Let us demonstrate this De Raef equipment in your plant—subject to sale. We will GUARANTEE YOU A SAVING sufficient to justify you to install this equipment.

We will send you the names of Ice Cream Plant Managers who will tell you their opinion of this Standardizer.

Every working part works in bath of special oil making it rust proof from the salt laden and damp air.

HOOSIER WILD CATS

President, EDWIN J. SMALL, Indianapolis, Indiana

Send all communications to H. A. STEVENS, Sec'y and Treas. 717 Railway Exchange, Chicago, Ill.

THE WILD CATS REVEL.

The Hoosier Wild Cats, although the youngest of its kind in the country, put on an entertainment at the Indianapolis convention of the Indiana Association of Ice Cream Manufacturers that would do credit to one of the oldest. To say that it was "good" only partially tells the story.

At the conclusion of the big banquet in the Claypool hotel the Wild Cats took charge of the meeting and made everybody feel good. A jazz orchestra furnished the enlivening stuff and a couple of good singers not only sung themselves out but made everybody else sing. The leader was not satisfied until he "showed up" two particular tables of warblers whose harmony was not unlike that of a back fence chorus in summer time.

The big hit of the evening was the address by Mr. Douglass Malloch, of Chicago, who kept his audience of over 200 of the best folks in the world at high pitch for an hour and a half, but which didn't seem that long. He started in by saying that he had often wondered what made wild women wild. He said that he had reached the conclusion that the Hoosier Wild Cats are responsible. Mr. Malloch carries his audience from the sublime to the ridiculous and back again as only a finished artist can do. He is a humdinger.

We are privileged to quote below a letter from Secretary Holly to Secretary Stevens of the Wild Cats. This letter tells how the entertainment was appreciated by the ice cream manufacturers better than we can tell it. Here it is:

Indianapolis, Ind., Dec. 21, 1921.

Mr. H. A. Stevens,
Care Hoosier Wild Cats,
717 Railway Exchange Bldg.,
Chicago, Ill.
Dear Mr. Stevens:

It is certainly with great pleasure that I learn that not anybody in our organization expressed any unfavorable criticism about the remarkable program which your organization so unselfishly furnished last Wednesday night at our annual meeting. Reports come to me that it was by all odds the very finest entertainment which has been put on at any annual meeting in this state. I have said to you and to many that there must always exist a very friendly spirit between the manufacturers of dairy products and the men who make and sell the machinery and products without which the manufacturers could not operate.

We congratulate you upon so successfully handling not only this program but your organization. We further congratulate you upon having a clean, dignified program throughout. If there is anything we can do to assist you this coming year, let us know. Wishing you the compliments of the season, we are

INDIANA MANUFACTURERS OF DAIRY PRODUCTS,
A. P. Holly, General Secretary.

The entertainment committee, consisting of Harry A. Stevens, chairman; E. J. Small, Elmer Mack, and Geo. C. Anderson, have reason to feel all puffed up over the success of the affair. Another member, who apparently constituted himself as chairman of a self-appointed committee of one to hustle memberships, was H. H. Adler, of Mayburn fame. He led each new man up to the operating table where he was divested of superfluous coin of the realm which made him a member in good standing of the wildest bunch of wild cats in existence.

At the regular business meeting of the organization on Dec. 15th the following officers were elected:

President—E. J. Small, Indianapolis, Ind.
Vice-President—C. E. Bishop, Indianapolis, Ind.
Secretary-Treasurer—Harry A. Stevens, Chicago, Ill.

The old officers were re-elected with the exception of Mr. C. E. Holmes, who served as vice-president last year. Mr. Holmes no longer travels in the Hoosier state so the members reluctantly dropped his name, after voicing their appreciation of his splendid efforts in behalf of the organization in 1921. Mr. Holmes was unanimously elected an honorary member.

The Hoosier Wild Cats have a reputation to sustain now and we are betting that they will live up to it and then some. They keep busy the year round and that helps when the big occasion arrives. Success to them.

YE-OW!

Just as we push to press we received a letter from Secretary Stevens advising us that Ed Razey, who was elected "Keeper of the Cat" at the Indianapolis meeting, is getting cold feet on the job. We are privileged to quote from a letter which he wrote the secretary as follows:

There seems to be some misunderstanding about this "Custodian of the Wild Cat" move. I think you will remember that it was to be a "Stuffed" (meaning mounted) Wild Cat of which I was to be made custodian. That the erstwhile stuffed feline was to serve as the emblem of our association and to be used each year at our state convention. I think you will agree with me that it will hardly be fair to me that a live wild cat be substituted for the harmless variety as I understand there is a move on foot now to play just such a low down wild cat trick on me. This is really a warning that if the boys do go on through with such a move I will not be responsible for the value of a live wild cat as I already have it figured out that it would be cheaper to pay a taxidermist once than to hire a chamber-maid for a live one for even one year. This is really therefore notice that the association as a whole can be expected to assume responsibility for the value of the live wild cat.

In view of the above I am no longer in doubt as to what it is that makes a wild cat wild. If there are any who really don't know the secret I am sure they can learn the answer if they will ask any member of the Indiana Manufacturers of Dairy Products who knows me personally.

Yours without regret,
ED. RAZEY.

P. S.—How big is this wild cat going to be, so that I can have a glass case already for him (or her) when it arrives.

THERE ARE EXCEPTIONS IN EVERYTHING.

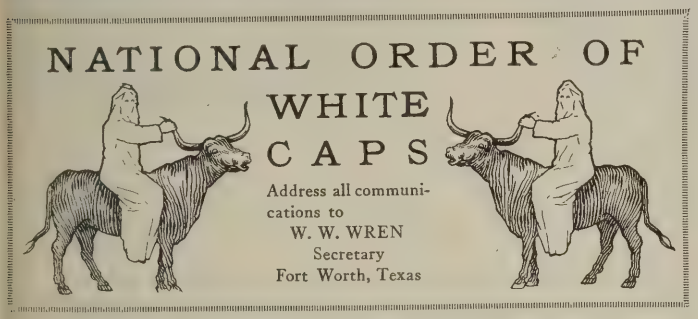
You know, as a rule, it is awfully hard to get a fellow to have his picture taken—you'd know better if you sat here in the office and read the answers we get from requests for photos—but if you will refer to page 94 of this issue to the picture of the Delegates and Exhibitors at the Southern Ice Cream Show held in Atlanta, Ga., you will find exceptions to the species. Here we find that "Red" of the Homer Cabinet Co.; Dave Gundrum of the Keiner-Williams Stamping Co.; Peter Miller, Jr., of the Crown Fruit & Extract Co., past president and now secretary of the Dixie Flyers; B. B. Scott of Scott's Coffee Flavor fame, the newly elected president of the Dixie Flyers; and the tall man on the end (in other words, a few of the exceptionally fine looking chaps), thought they would kill two birds with one stone and have their pictures taken twice in the same place. We just wanted to explain this to our readers so they wouldn't think there were two of such individual men in the world and to put them wise that they were not seeing double.

RETINNING ICE CREAM CANS

Special Department

WE DO REFINISHING of old ice cream cans in a special department of our plant which devotes its entire time throughout the year to doing this one thing and doing it well.

OLD CANS MADE NEW AT LOW COST



And we do know how to fix up your otherwise hopelessly rusty old cans so they will be tight and bright and good as new. IT IS NOT EXPENSIVE and PAYS YOU A DIVIDEND. A can retinned by us has a thicker coat of Pure Block Tin than when new.

SAMPLE CAN RETINNED FREE

This is the time of year to send cans for renewal. Send us a sample can NOW. We will repair and retin it without charge and return it promptly, so you can see the quality of our work. Write us when you ship it, so we will know whose it is, and we will do the rest.

OAKES & BURGER COMPANY

Established 1873 **CATTARAUGUS, N. Y.**

WHITE CAPS INITIATE BIG CLASS.

The National Order of White Caps put on one of the entertainments at the Fort Worth convention for which they are famous. If any candidate for membership failed to get his money's worth he is surely hard to satisfy. The writer, as one of them, got his money's worth long before the perpetrators decided that he had value received.

W. W. Wren, of Fort Worth, as chairman of the entertainment committee, secretary-treasurer and a little bit of everything, seemed to enjoy his job. He made good, too, and was entitled to the praise he received for staging such a good show. The entertainment "electrified" the audience—at least a portion of it—and Mr. Collins assisted nobly as referee of the bout between a couple of prominent lightweights. The membership list of the National Order of White Caps was increased considerably as a result of the Fort Worth meeting and its future usefulness is assured.

⚜

Nothing will develop latent wickedness in a man faster than being watched.

THE KANSAS ASSOCIATION OF ICE CREAM MANUFACTURERS.

The Kansas Association of Ice Cream Manufacturers meet at Hotel Baltimore, Kansas City, Mo., January 26 and 27.

This convention was postponed from December 15 and 16 on account of the small pox epidemic.

The officers and members of the Kansas Association extend, through The Ice Cream Review, an invitation to all ice cream manufacturers, whether in Kansas or outside, whether members of our ice cream association or otherwise, and a cordial welcome to meet and attend with us.

We have a splendid program. The small pox epidemic is completely stamped out and we can assure you a grand good time and profitable trip. Come, and be one of us.

Owing to the fact that there are two other large conventions in Kansas City the same week, it would be well to make your hotel reservations early in order to get choice rooms, although there is no doubt but that you can get accommodations.

KANSAS ASSN. OF ICE CREAM MFRS.
L. R. Manley, President.
B. T. Perkins, Secretary.

⚜

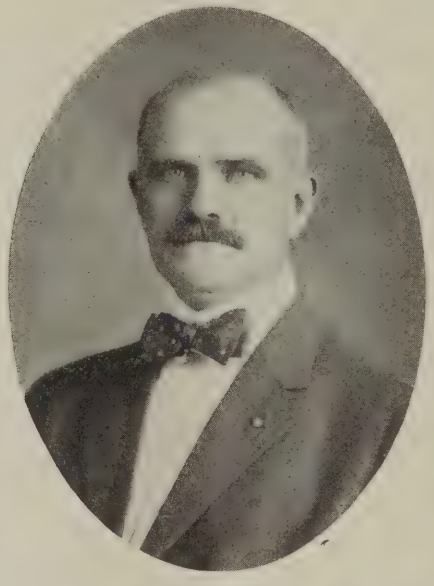
A 1922 REMINDER.

A beautiful maiden adorns the calendar which the Thomas W. Dunn Company, New York City, are sending to their friends as a reminder of the fact that they are manufacturers and importers of gelatine and that "Cox's Gelatine" in "The Checkerboard Package" has been used by American housewives since 1845.

LAST MINUTE "CELEBRITIES."

For a long time we have tried to obtain the photos of A. O. McCune, secretary of the Iowa Poodle Dogs Association and representative for the Morton Salt Co. of Chicago, Ill., and of Chas. Gifford, a Badger Flyer and representative of the Gelatine Department of Swift & Co., Chicago, Ill.

At the last minute, our efforts have been crowned with success. These men are regular attendants at the various conventions and we hope to meet them at some of the coming events scheduled for this month and which events we have tried to boost in this issue of The Ice Cream Review.



Mr. Gifford says we may think his delinquency is due to shyness, but it isn't true, he attributes his procrastination to diplomacy. He says, "It takes diplomacy to get a picture back from one of your best girls. It was either that, or else go to the police for the copy in the well-known rogues' gallery." We are glad to know he chose the former method, although we don't know but what it would have been safer to choose the latter. When you are captured and sent to jail, you get 60 or 90 days usually, but when you are captured by a girl, you get "Life."

SMILES ARE CONTAGIOUS.

You will find C. W. Kester, the genial representative of the Michigan Salt Works, Marine City, Mich., and well-known Michigan Dairy Booster, elsewhere in this issue of the Review, and in his own words, he explains the happy expression which illuminates the face of the picture. He says: "I am very happy as you can see by the smile. I could not be any other way after finishing one of the best years I have had calling on the ice cream trade. This is due to the many friends that I have in the ice cream business and I am glad that I am one of the Boosters at the convention. I am sure that this one will be long remembered and talked about. Michigan has a live bunch of ice cream men, so let's be there and make it a real convention."

Secretary Iowa Poodle Dogs.

JUST IN TIME TO SAVE ESKIMO PIE.

We read an account of a fire recently in the Tyler Brothers ice cream factory in Villisca, Iowa, in which the flames were stopped just in time to prevent the discontinuing of the making of Esquimo Pie, the brand new and already famous ice cream confection. We think this speaks for itself as to what the public thinks of this popular new ice cream bar.

LOWER EXPRESS RATES

Comparative Costs Old Method and New Method for Interstate Shipments

	25 Miles or less	25-37 Miles	37-50 Miles	50-100 Miles	100-150 Miles

Prospects for the Dairy Industry in 1922

By E. W. CHANDLER, President, The Creamery Package Manufacturing Company

Father Time has moved another step forward and we are standing on the threshold of a new year. What will it bring forth?

For many of us the year 1921 will be long remembered because it was, for business men, a year of heavy anxieties and painstaking watchfulness. Fortunately, because of the sound financial position of the United States and the great resources of the country, we suffered no panic nor great failures. Here and there a business craft floundered because it was not soundly managed, or was financially weak, but we had no outstanding failures as in former years of business depression and the company, large or small, which endeavored to give honest service had made the long pull.

E. W. CHANDLER

There is now no question but what the worst is over. We have reached the bottom of the hill and are now climbing toward the pinnacle of prosperity.

An improvement has been felt all along the line since early fall, prices have quit receding and in most business centers, the building permits have broken all records. No concern could build at a more opportune time than now, if present quarters are inadequate. Wages have dropped materially and labor is keen to give a full day's work for a full day's pay. While not all building material has been reduced in cost, much of it has, and building can be done today at two-thirds of what it would cost a year ago. The man who expects building costs to drop much lower is very optimistic indeed.

Most classes of farmers have suffered from low prices and, except for replacements, they will buy sparingly during the coming year. But there is one splendid exception—the dairy farmer. In most parts of the country he has been getting a good price for his milk or cream—and disposing of his entire output. The dairy farmer is not hard up and from this standpoint our depression has not been without value, for it has taught the one-crop farmer the value of the dairy cow. Carload after carload of dairy cattle is going into the grain sections, and our dairy sections would be swept clean of cows if the one-crop farmer was not so hard up .

This man won't forget his lesson in a hurry and by building up a dairy herd, he will have the best insurance policy in the world against hard times.

Our federal reserve banking system has proven under severe trial its ability to prevent serious panics. A dairy herd on every farm will tend to prevent times of depression, not only on the farm but in the city as well, for in the last analysis the prosperity of the city is dependent on the prosperity of the farm.

Conditions in foreign countries are improving very rapidly. The limitation of arms conference is going to relieve the world of a great load of taxes and will provide the world with a practical League of Nations. Already the spirit of the conference is acting as leaven in the affairs of the world. The Irish question is undoubtedly settled once and for all. The allies will relieve Germany of part of the reparation load and assist her in reorganizing her fiscal system.

The nightmare of Bolshevism has been dissipated and trading with Russia has definitely opened up. The improvement in European conditions is going to have an invigorating effect on business in this country. She needs an immense amount of the raw material that the United States possesses and her purchasing ability will rapidly improve. Europe will need grain, cotton, steel, dairy cattle and dairy products in great volume.

Every year sees more and more recognition in the value of the dairy industry by our press and public, thanks to the educational work of the various dairy organizations, the dairy press and the advertising of the individual members of the industry.

We have done much to improve the dairy industry during the last few years but we still have much to do. We must educate our great metropolitan press as to the healthfulness of dairy products; we must educate our teachers and through them the youth of the land; we must educate our physicians,—to the end that the consumption of dairy products be increased. And we must see that production keeps pace with consumption. We must educate the one-crop farmer to keep dairy cows and we must educate the diversified crop farmer to keep more and better cows.

If we will band together to boost the dairy industry on the highways and byways, in the pulpit and in the press, in the school and on the dairy farm, great will be our individual reward, and still greater will be the benefit we will confer on the entire country. By encouraging a greater use of dairy products, we will assist the public to live more economically, we will raise the standard of living and we will have an integral part in producing a healthier and better race of American citizens.

THE KANSAS ASSOCIATION OF ICE CREAM MANUFACTURERS.

The Ice Cream Review:

We again ask through your valuable publication, the privilege of calling the attention of the Kansas Ice Cream Manufacturers Association members and all others concerned, to our postponed annual meeting, which will occur in Kansas City, Mo., January 26th and 27th, headquarters, Baltimore Hotel.

It was with great regrets that we were compelled to postpone our meeting fixed for December 15th and 16th on account of health condition prevailing at that time in Kansas City, but we are glad to say that health conditions are again normal and that all arrangements are being made for a good meeting January 26th and 27th.

We feel that the uncertainty prevailing in many lines of business at this time and some extent in our own, makes it very necessary that every member of our association and all others interested in our industry, be at this meeting. You owe it to yourself and the industry at large. Make your arrangements now to attend.

Very truly yours,
LOUISIANA ASSN. OF ICE CREAM MFRS.,
L. R. MANLEY, President.

Without personal ownership of property mankind would sink lower than the Digger Indians.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

EXPORT DEMAND GROWS FOR REFINED SUGAR.

Decline in Prices and Low State of European Sugar Stocks Leads to Larger Movement.

The opinion expressed in Facts About Sugar states that export demand for refined sugar which has been growing for over a month has now reached fairly large proportions, estimates in well informed quarters being that about 5,000 tons daily were sold during the latter part of December for shipment from Eastern ports alone.

The demand appears to have shown a sudden gain when prices recently reached a level of 3 cents for export refined, and has been well maintained as a result of subsequent price declines.

Foreign Buyers Attracted.

The fact of the matter seems to be that buyers in other parts of the world are beginning to believe that prices have reached a point that makes purchases in this market attractive and that such declines as may take place in the immediate future will not be long maintained.

According to a report from one of the largest sugar dealers in Europe, the trade there believes that the bottom is now in sight and that while a decline of a few points in the raw sugar market is still possible, if such a decline materializes it will only be the signal for an attempt on the part of buyers to absorb large quantities of sugar at the lower levels, such buyers anticipating a profit by the subsequent increase in values.

European Supplies Low.

From the same source it is learned that the supply of refined sugar in Europe is much lower than has been generally supposed and that buying from that market is likely to be of material volume for some time to come.

Supplies in England, according to this authority, are so low that if the country tried to purchase a month's supply of sugar the movement would result immediately in a substantial advance in the market.

The attitude of European buyers towards the sugar market and values of today is reflected in the fact that the Dutch sugar syndicate, which normally is a large seller in England, has refused to meet the competition set by American granulated, and does not propose to re-enter the market until prices for export from here have reached a level of about four cents.

* * *

AMERICAN WINS ANOTHER SUIT.

Boston, Mass.—Damages in the amount of $5,000 were awarded the American Sugar Refining Company in its suit against the Daggett Chocolate Company, of this city, by a jury in the United States district court here last week. The action was one of those brought by the refining company for repudiation of contracts entered into last year to buy sugar at 22.5 cents a pound. The case was the first involving such contracts to be tried in New England.

On the question of the various defenses which were urged, which were substantially those offered in other cases on similar contracts, District Judge Morton ruled as a matter of law the defendant could not sustain.

RESUME OF 1921 SUGAR INDUSTRY.

In the period from May, 1920, to the end of the year, in Facts About Sugar, the price of 96 degree test sugar had fallen from the high mark of 24.67 cents a pound to 5.39 cents. This downward movement continued without interruption during the first few weeks of the year and brought the raw quotation to 4.5 cents. In February and March there was a temporary recovery, due to the establishment of the Sugar Finance Committee with authority to handle the sale of the Cuban output, but in April, as it began to be evident that Cuba would produce another large crop, the downward movement of prices reasserted itself and continued to the end of the year, at which time the cost and freight price of Cuban raw sugar in New York was 1.75 cents a pound, the lowest point it had touched in nineteen years.

Although prices at the close of the year have declined to a level that is ruinous to many producers who made their crops under the abnormally high costs prevailing in 1920, the outlook in other respects is far more encouraging than it was twelve months ago. At that time the trade, and to some extent the large consumers of sugar were loaded up with heavy stocks bought at high prices, which it was evident they must sell at tremendous losses. At the present time stocks in distributors' hands all over the world are lower than they have been for years. The displacement of supplies in 1920 which led to acute congestion in this market has been overcome, while the improvement in exchange and in the general industrial condition of Europe is making that market an active purchaser of Cuban sugar in the form of raws and of refined.

To summarize conditions, it may be said that while 1921 has been a year of heavy losses for producers, it has carried well toward completion the readjustment made necessary by the abnormal course of prices during 1920 and has paved the way for a gradual improvement in market conditions, which is clearly promised to 1922. The year 1920 was filled with undue inflation, followed by demoralization, while 1921 was a period of depression and readjustment and 1922 promises to be one of recovery and of the gradual restoration of a normal relationship between supply and demand.

* * *

U. S. DEPARTMENT OF AGRICULTURE ESTIMATE.

The sugar production of the continental United States in 1921, covering the beet and cane sugar crops whose production is now in the final stages, totals 1,142,305 long tons (1,279,382 ordinary tons) according to the final estimates for the year, issued by the United States Department of Agriculture.

Beet sugar production is estimated at 2,024,764,000 pounds, or 903,912 long tons, and that of cane sugar at 534,000,000 pounds, or 238,393 tons.

As compared with the crop of 1920 the combined figures indicate a slight increase in the country's aggregate production, the falling off of approximately 7 per cent shown by the domestic beet sugar crop being more than offset by a gain of more than 50 per cent in the cane sugar output. The 1920 total for beet and cane combined was 1,130,477 long tons, of which beet sugar contributed 973,233 tons and cane sugar 157,244 tons.

PROMPT SERVICE **ATTRACTIVE PRICES**

Address Inquiries Dept. 2-B

SUGAR MARKET CONDITIONS IN A NUTSHELL.

Cuban centrifugals declined to 1.75 cents, cost and freight, following withdrawal of commission control. The advancement was one-sixteenth at the close of the week. The volume of export trade is growing. New York refined quotation reduced to 4.8 cents. Active demand for clarified reported from New Orleans. Refiners have been taking raws much more freely and the market has been kept pretty well cleared of this class of sugar; planters are taking this as an indication of improving conditions.

* * *

FUTURES SHOW MORE STRENGTH.

As we go to press, the range of prices on raws was as follows:

	High	Low	Closing
January	2.00	1.92	2.00
March	2.11	2.07	2.10
May	2.26	2.20	2.26
July	2.44	2.38	2.44
September	2.56	2.50	2.56

REPORT FROM HONOLULU.

Many sugar plantations have not received sufficient returns to cover the cost of production, and are living off the surplus they had the foresight to lay aside during the prosperous season. The conservative policy with which the sugar industry of the territory has been conducted alone has protected the business and financial interests from sudden and serious disaster.

JUNK ?

NOT WHEN YOU GET THEM BACK

Your cans may look like wrecks —it may seem hopeless to reclaim them for another season of use, but unless you have tried our retinning service you don't know the possibilities of making old ice cream and milk delivery cans look like new. Furthermore there is a big saving in having your cans retinned.

Now is the time to look your cans over and send the bad ones to us for redemption. OUR TRIPLE TINNING INSURES SATISFACTION.

DALLAS TIN PLATE CO. 2836 N. Haskel Ave. DALLAS, TEXAS

SUPPLY MEN SUPPORT NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS IN NEW YEAR GREETING.

Also Issue Important Business Resume.

The Association of Ice Cream Supply Men expressed its support of the National Association of Ice Cream Manufacturers in a unique way in sending the following handwritten 1922 greeting to all wholesale ice cream manufacturers in the United States and Canada:

"Our New Year's Wish."

"It is our happiness this holiday to wish that you may have the greatest business good that 1922 can give.

"It is a wish that—if you do not do so now you may begin this year to benefit by national association with your fellow manufacturers. The National Association of Ice Cream Manufacturers has proved that it gives to one the strength of all.

"We wish you, also, new profits, the esteem of your community, the consciousness of things done well. But in their essence all these things will come in the fulfillment of one wish—that from now on the strength of the National Association of Ice Cream Manufacturers may be yours!

"As it is ours, through organization, to serve, may it henceforth be yours, through the National Association of Ice Cream Manufacturers, to grow to greater influence and power.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN.

January 1st, 1922."

Enclosed with each copy of this greeting was a pamphlet written by Mr. Chas. G. Morris, president of the National Association of Ice Cream Manufacturers, outlining the past and present services to the industry of that association, under a caption, "Do You Know What **You Owe** to the National Association of Ice Cream Manufacturers?"

In a confidential printed bulletin to its membership, dated December 20th, 1921, the Association of Ice Cream Supply Men, summarizing general business conditions and trends, said in part: "Nevertheless in the country taken as a whole money is easier and there is markedly less inflation; in manufacturing sections savings bank deposits have lessened yet unemployment is also slightly reduced. The latest comprehensive figures available on commodity production, wholesale prices, general cost of living, etc., are those ending November 1st. The production of basic commodities increased slightly in October over the previous month and on November 1st the stocks of such commodities held at various points in the distributing chain were lower. Domestic wholesale prices computed by the U. S. department of labor show that on November 1st the cost of farm products, metals, food chemicals, clothing, fuel and lighting, building materials, house furnishings and miscellaneous other commodities averaged one-half greater than the 1913 average and compared with the maximum prices of 1920 as 15 does to 27. Figures compiled by the same government department show that average weekly earnings throughout the United States of workers in men's clothing, boots, shoes, woolens, car-building, silk, cigars, textile, paper, hosiery and underwear, cotton furnishing, cotton manufacturing, leather, automobile, iron and steel industries compare with average earnings within the same industries in 1914 as 16.4 does to 10.

"Results of the limitation of armament conference, it is general belief, will stimulate and give confidence to general business in greater degree than any event since the war's end."

LOUISIANA ASSOCIATION OF ICE CREAM MANUFACTURERS.

Monroe, La., Jan. 1, 1922.

All Members:

Our second annual meeting will be held in New Orleans at Hotel Grunwald, on Jan. 19th, 1922. We are counting on you to be there and have at least one of your friend competitors with you that does not belong to the association.

All members are urged to be in New Orleans either the night of the 18th, or early morning of the 19th so that we may have one full day, and be able to leave the night of the 19th.

You are advised that the war tax, express, freight and passenger and ice cream is repealed effective Jan. 1st, 1922. With the season's best wishes and hoping to see each of you at the convention, I remain.

Yours very truly,
LOUISIANA ASSOCIATION OF ICE CREA MFGS.,
By Secy.-Treas. N. F. Manning.

BIG ATTENDANCE AT CEDAR RAPIDS ASSURED.

Association of Ice Cream Manufacturers of Iowa.

The nearer we approach the time for the annual meeting of the Association of Ice Cream Manufacturers' of Iowa, the better the outlook is for a record breaking attendance.

The weather is in our favor, the sale of ice cream is light, the ice crop will have been harvested by then, the yearly statement will be out, the income tax figured and everybody will need a rest and an opportunity to recuperate and spend some of the excess profits and there will be no better place and opportunity to do this than at Cedar Rapids, January 24th and 25th.

Remember there are only two days, but arrive early and stay late. You can't afford to miss any of it. Something will be moving all the time. The program will be a good one. Secure your reservations in advance and in doing so provide space for the wife.

We will look for you, don't disappoint us.

W. S. WILCOX, President.

TO ALL BARKERS.

Chicago, Ill., Jan. 4, 1922.

The Association of Ice Cream Manufacturers of Iowa will hold their annual convention on January 24th and 25th at the Montrose Hotel, Cedar Rapids, Iowa. A very large attendance of both manufacturers and supply men is anticipated. This is the one opportunity that you will have to become personally acquainted with the Iowa Ice Cream Manufacturers and a personal acquaintance will surely be of value to you during 1922.

You will, no doubt, plan to be there yourself and to insure the success of the meeting, you should urge every supply man you meet and all of your customers to be sure to be on hand.

The Kansas Ice Cream convention is to be held at the Baltimore Hotel, Kansas City, on January 26th and 27th. I am informed that the Rock Island has a train with sleeping car service leaving Cedar Rapids at 7:00 P .M., arriving Kansas City at 7:25 the following morning. Any of you who wish to go to Kansas City from Cedar Rapids should write the Rock Island agent at Cedar Rapids for reservations on their evening train on the 25th.

HELP WANTED

WANTED—First class salesman to sell a full line of materials to ice cream and candy manufacturers. Great opportunity for man who is able to produce. The Wexmar Co., 2712 Montrose Ave., Chicago, Ill. 2-22

WANTED—By April first ice cream maker in an up-to-date factory. State experience and salary wanted. Jersey Creamery Co., Newcastle, Ind. 1-22

WANTED—Practical ice cream maker who understands homogenizing, pasteurizing, testing, standardizing. New modern plant located 175 miles from Chicago. Address: R-203, Ice Cream Review. 1-22

WANTED—We are installing a large ice, refrigeration and ice cream plant and have an opening for a young man who is well up in ice cream making and wants to grow up with the business wuold like to have a man interested and who is a sticker, as this business is new here and has to be built up. If interested address Box 32, Celaya Guanajuato, Mexico. 1-22

POSITION WANTED

HIGH GRADE ICE CREAM MAKER, capable all around dairyman, open for engagement. Thirty years' practical experience, expert on testing, standardizing, pasteurizing milk, cream. Thoroughly experienced in all departments inside, and outside work, steam, refrigeration; good mechanic; reliable; best of references. Will guarantee to save and make you money in your plant. Desire position with reliable firm. Address: R-48, Ice Cream Review. 7-21tf

POSITION WANTED—As a well known member of Supply Men's Association I cannot openly lend my name to recommend a man for managerial and buyer's position, but I have in mind a man who knows as much all around about the scientific and practical side of the retail milk and wholesale ice cream city and country as any manager I have met in 25 years travel all about the country, he is of the highest type of executive. He is well situated but might make a change of location, 29 years' experience. Nothing under $7,500 or $10,000 considered. Address: R-92, Ice Cream Review. 1-22

POSITION WANTED—As superintendent or manager of ice cream plant. Technical trained college man, in creamery with two years' experience. Address: R-208, Ice Cream Review. 1-22

POSITION WANTED—By thoroughly experienced person who understands modern methods of ice cream making. Nine years' experience. Furnish best of references. Address: R-207, Ice Cream Review. 1-22

POSITION WANTED—As manager of large ice cream business, fully acquainted with all details of manufacture handling and sales, prefer position offering working interest. Address: R-206, Ice Cream Review. 4-22

POSITION WANTED—Efficient butter, ice cream production expert. Thoroughly conversant, practically, and theoretically, in every phase of milk productions. Specialty in ice cream. Instructor in microscopic work, Mojonnier, testers, Babcock, fancy creams, ice cream cakes, cultures, buttermalks, starters, condensories, butter making, homogenization, honores in butter makers' contest, state certificate, grading, sampeling, weighing and testing, milk distributing. Will satisfy my statements at first conference. Twenty years' practical experience, good references. Present position, superintendent of large ice cream and butter department, also control laboratory work using my influence over large milk distributing business. Company doing two million dollar business. No small position considered. Address: R-204, The Ice Cream Review. 1-22

POSITION WANTED—By university graduate, thoroughly experienced in milk products, ice cream manufacture, etc. Capable of handling position as manager, chemist, or scientific expert. Willing to travel, service work or good selling proposition. Only high grade position desired, at present employed, references. Address: R-201, Ice Cream Review. 1-22

POSITION WANTED—Agricultural college graduate, having specialized in dairy manufacturing, with a thorough practical knowledge of ice cream manufacturing desires position as superintendent or assistant superintendent in city milk or ice cream plant. South or East preferred. Address: R-108, Ice Cream Review. 1-22

POSITION WANTED—As ice cream maker; 10 years' experience. Capable of handling 3,000 gallons a day. Address: R-101, Ice Cream Review. 1-22

FOR SALE BARGAINS

FOR SALE—Controlling interest in prosperous ice cream business in live Wisconsin manufacturing city. Would consider as trade northern lakes property, improved or unimproved, in Wisconsin, having summer resort possibiilties. Excellent opportunity—good reason for selling. Address: R-105, Ice Cream Review. 1-22

FOR SALE—Cheese factory. If you want to buy a factory write to us. We have some in Taylor, Clark, and Marathon counties in prices from $4,200 up to $11,000, all are located in the Clover Belt of Wisconsin. For any information write to F. D. Steinert, Abbotsford, Wisconsin. 3-22

FOR SALE—Established ice cream plant doing good business, in live Michigan city with two railroads Good reasons for selling. Address: R-200, Ice Cream Review. 2-22

FOR SALE—Ice cream factory. Good shipping point. Sell reasonable. Good location. Address: R-205, Ice Cream Review. 1-22

MACHINERY AND SUPPLIES AND

BOILERS, NEW AND SECOND HAND—Electric Motors, Engines, Pumps, Pipes and fittings, Valves, Belting, Shafting, Bearings and Pulleys. Money Saving prices. Harris Machinery Co., Minneapolis, Minn. 12-20tf

FOR SALE—Three new Cherry model "I" 60-quart freezers; motor driven. Rich Ice Cream Co., Buffalo, N. Y. 3-21tf

FOR SALE—In excellent condition, one 1000-gal. copper tinned Cherry ice cream batch mixer with direct connected A. C. 220-volt, 3-phase, 60-cycle motor. Immediate shipment. Address: Box 250, Elyria, O. 9-21tf

FOR SALE—The following good ice cream equipment: Cabinets, cans, tubs, vats, viscolizer, ice cream freezer, ice machines, flavors, ice breakers, motors, automobile trucks and wagons. For information apply Kelly-Lester Milk Company, Twelfth and Pine Streets, Philadelphia, Pa. 2-22

FOR SALE—Three Cherry 40-quart brine freezers, belt drive. All in first class condition. Overhauled last year. We are replacing with larger size Cherry freezers. Will sell, one, two or three to first bidder. Address: R-104, Ice Cream Review. 4-22

FOR SALE—Ruff condenser, 4-roll, No. 7 machine. Used two seasons. Will sell cheap. Mifflin Creamery Co., Inc., Mifflintown, Pa. 1-22

FOR SALE—Meyer refrigerator body, No. 202, Type A, for 2½-3 ton chassis, used April to October this year, perfect condition but too small for route. Immediate delivery. White Dairy Products Co., Raleigh, N. C. 1-22

FOR SALE—1, No. 1 DeLaval Emulsor, good as new, new bowl, spindles and bearings; 12 Babcock tester, 8, 10, 12 bottle sizes; 1 24 bottle Crepaco Babcock tester; 1 Toledo Print scale, good as new; 1 small Blackmer Pump, bronze, ½ inch connections; 1 Jensen Bronze Sanitary 1¼ inch connection pump; 1 Trahern Iron 1 inch connection pump; 1 Farrington enameled moisture oven; 1 continuous double disc ice cream freezer, 100 gallon capacity, with counter shaft and pulleys; 1 250 gallon Wizard disc vat; 1 Ventura 18 inch wall suction fan (new); 1 12 bottle Troemner cream scale. Ottawa Condens-

FOR SALE—One 15 horsepower International Harvester Co.'s engine. Runs on kerosene, gasoline or naptha. In first class condition. Have about $50.00 worth of extra parts or will trade for a one and a half horsepower electric motor. Address: Moline Ice Cream Co., Moline, Illinois. 2-22

FOR SALE—I will sell to a live business man one-half interest in new vacuum container for shipping ice cream. No ice. No salt. One-half the weight of ordinary shipping package. Keeps cream in perfect shape for upwards of 24 hours in hotest weather. If you mean business address H. C. Folger, 181 King St., Northampton, Mass. 1-22

FOR SALE—Cottage cheese in one, two or five tub lots, shipped date of make. Rock Lake Creamery, Lake Mills, Wis. 1-21

FOR SALE—Three brand new 2½-ton Sterling ice plants all complete with fittings, coils, valves, ammonia, etc., ready to install. Sacrifice for less than one-half wholesale cost. F. E. Tarrant, 1232 W. Van Buren St., Chicago, Ill. 2-22

FOR SALE—Fifty second-hand Western style cedar tubs, used one season. Will sell cheap for quick movement. The Conner Ice Cream Co., Coshocton, O. 2-22

FOR SALE—One 40-gal. Sharples emulsifier used one year. Paid over $800. Will sell for $400. Herman F. Miller, 1126 Buttonwood St., Reading Pa. 1-22

FOR SALE—Two vertical open top, blue enamel, 38 in. O. D. by 37 in. high, 125 gal., $200.00 each. Three vertical, open top, 37 inch O. D. by 48 in. high, 225 gal. capacity, $225.00 each. Eight vertical, open top, 6x9 feet O. D. by 3 feet high, 768 gal. capacity, $300.00 each. Chas. S. Jacobowitz, Buffalo, N. Y. 1-22tf

FOR SALE—Miller, Ft. Atkinson and other makes motor and belt freezers, 400 gal. Progress belt homogenizer, also vats, batch mixers, cans, coolers, etc. Send for list. Philadelphia Retinning Co., N. Philadelphia, Pa. 1-22

FOR SALE—Six 40-quart Tyson Advance Special Ice Cream Freezers. These Freezers are new, belt driven, and will be sold at a very low price. Address: J. B. Parker, 608 Cherry St., N. E., Canton, O. 2-22

WANTED TO BUY

WANTED TO BUY—Established ice cream plant. Middle west preferred. Describe fully in reply. Address: R-90, Ice Cream Review. 1-22

WANTED—Wholesale ice cream plant in city of 25,000 or over with good shipping advantages. Must have considerable volume of business. Cash proposition if interested. Describe fully in reply. Address: R-202, Ice Cream Review. 1-22

WANTED—To hear of good business for sale. Send description. 500 Kasota Bldg., Minneapolis, Minn. 2-22

MACHINERY WANTED—Viscolizer, capacity 100 gallons per hour or larger. Cherry Perfection churn, capacity 600 to 1,000 pounds. Cherry Perfection pasteurizer, 300 gallon capacity. Friday butter printer, 90 pounds capacity. This equipment must be in good condition and price reasonable. Write or wire J. W. Clopton. Decatur, Alabama. 4-22 1-22

The Ice Cream Review

Volume Five—Number Seven MILWAUKEE, WISCONSIN—MARCH, 1922 Two Dollars a Year

The Dreadnaught 60 Cherry Brine Freezer

THE illustration shows the Thomas Batch Measure with which we can equip this model.

Let us quote you on a complete outfit as shown.

THIS model Cherry brine freezer is a 60 quart machine. An unusually fine machine mechanically, it is equipped with all the well known patented features found on all Cherry freezers. The inner freezing cylinder is removable; all controls are at the working end of the machine and it can be furnished for either belt or motor drive. Additional features on the Dreadnaught 60 are a swinging or hinged head; a rim expansion clutch on the belt drive; a sanitary, symmetrical white enameled base, all exposed metal parts heavily nickel plated.

Bulletin 2011 gives you full details of this and the other models of Cherry Brine Freezers. Send for it.

MARCH 1922

REPORTS coming to us from all over the country indicate that ice cream manufacturers are preparing for the biggest year they have ever enjoyed. Optimism is rampant, and if the weather man behaves the business will come. Everybody in the business is looking to see better business conditions prevail generally, and this means more money expended for ice cream if the weather is favorable and if the ice cream is of good quality. Many ice cream manufacturers are planning big advertising campaigns, and are going to go after business harder than they ever have before. These advertising campaigns are all right, and we thoroughly believe in them, but we hope that no ice cream manufacturer will make the mistake of thinking that an advertising campaign will expand his business, unless he backs up such a campaign with **quality** and **service.**

Let's make this a quality year in the ice cream business. There is no sense in making poor ice cream anyway. It doesn't pay the manufacturer to make it and the consumer doesn't want it—at least he doesn't want it the second time. There is no place in the ice cream industry for the price cutter. In the first place he must use cheap ingredients in making his ice cream and then he must give poor service to the trade. That isn't the way to build up an individual ice cream business; neither will it build up the ice cream industry.

Many ice cream manufacturers are right now wondering what ice cream should sell for during the summer months. As springtime approaches they are in the habit of guessing about what the price will be. It is a bad habit. Instead of fixing a price at what ice cream should sell for and then adjusting the quality and service to such a price, manufacturers should go ahead and make the very best ice cream possible, add a reasonable profit and let the price be fixed accordingly. This is the only way to build up a reputation for quality and it is the only way to build up an enduring business. There are many retailers who are looking for an ice cream at the lowest price, but their number is decreasing. Their numbers can be still further decreased by effective quality advertising, especially when they are shown where increased sales of good ice cream at perhaps a lower margin of profit bring them more money than decreased sales at a higher margin of profit. In your efforts to increase your gallonage don't sacrifice quality.

A VERY successful ice cream manufacturer recently expressed the opinion that more ice cream manufacturers are forced into bankruptcy through ignorance of depreciation costs, than from any other cause. He said that most ice cream manufacturers let their competitors run their business for them instead of running it themselves. Instead of conducting their business as good judgment would dictate they are always worrying about what competitors are going to do and then adjust their methods accordingly. Few of them, he said, realize what their depreciation costs really amount to, and the first thing they know they have a lot of worn out equipment on their hands with no depreciation fund to replace it with. They perhaps do a big business and think they are making money when they are actually operating at a loss. He said that he would not operate his factory at a loss in order to meet competition. He has built up his business on quality and service. He knows what it costs him to produce ice cream and he knows what price he must get for it in order to cover expenses, depreciation costs, and leave him a reasonable amount of profit. He admitted that the first few years he was in the business he worried about competition, but his good judgment finally predominated, and he says that he is satisfied that he would have been out of business long ago had he not changed his tactics.

This manufacturer keeps a very complete cost system in operation. Depreciation costs are part of his operating expenses, and he doesn't try to fool himself by making them lower than they really are. This man's experience might well be the guide for others who have not been in the business so long and whose chief aim seems to be to meet competition. Such men should adopt a good cost accounting system and then build their business on quality and service. It's a simple recipe for success in the business of manufacturing ice cream.

A LEARNED professor of the Harvard Medical School has been quoted as saying, "Had I the privilege of choosing between the liquor saloon and the ice cream parlor, I would favor the saloon." Had he stopped there he might have enjoyed the approval of millions of his compatriots who would gladly and promptly make the same choice. But he is quoted further: "No child under 5 years old should be given ice cream as it is detrimental to the health and well-being of the child." Thus he makes it clear that he is knocking ice cream and not merely expressing a desire for strong drink.

Just when you think that you have a fact established it is distressing to have someone, whose word should carry some weight, come along and throw a monkey wrench into the machinery. That is exactly what this loquacious pedagogue has done to us. There is a big, healthy appearing 7-year-old boy in our family who consumed more ice cream cones during his first five years in this vale of tears than a whole regiment of kids might be expected to consume. He developed the trait before he could hold a cone and his mother watched his dad stuff him with ice cream with uncertain judgment. We even waked him from sleep to save an ice cream cone and he always responded with all the manifestations of delight of which a normal baby is capable.

Now at 7 years of age he wears 12-year-old suits, stands a full head taller than the normal child of his age and weighs over 90 pounds. One of his favorite diversions is to "split a brick" with dad, and he is always ready for a cone or a coated ice cream bar. He is the picture of health and robust boyhood.

To have this learned professor now tell us that we made a horrible mistake in feeding the boy ice cream is indeed disconcerting. It's too late, however, and there is nothing to be gained by crying over spilled milk—or rather thoroughly melted ice cream.

AN ICE CREAM expert made the statement at a recent convention that practically all bacteria in ice cream comes from milk, cream and the butter used in the mix; that is providing the other ingredients are high grade. Buy the very best gelatine and other ingredients and you need not worry about poor quality so far as those ingredients are concerned. He says that experiments have proven that using good gelatine does not materially increase the bacteria count. Good gelatine is practically free from bacteria in spite of the fact that it is such a good medium for bacteria growth. This is just another evidence that in order to make a good quality of ice cream the best materials must be used.

THE best authorities recommend pasteurizing everything in the ice cream mix except the flavor. Some manufacturers follow the practice of holding out part of the mix so that it is not all pasteurized, but there is no good reason for it. Of course the flavor should not be added until the mix is pasteurized and cooled down, but everything else can go through the pasteurizer.

WE HOPE you will like the cover page on this issue of The Ice Cream Review. For some time we have been contemplating this change and in a series of drawings appropriate to the ice cream industry we hope to convey suggestions that will be pleasing and of real value to the ice cream manufacturer. The high school girl, dropping in at the corner drug store on her way home from school to enjoy her favorite dish, immediately suggests an advertising campaign directed towards our schools where additional information can be offered relative to the food and health value of dairy products in general and good ice cream in particular.

We are glad that the growing patronage of The Ice Cream Review makes this improvement possible. It is accomplished at considerable expense, but we feel confident that results will justify the change. With the continued co-operation of the big army of friends who are always found boosting for the paper, we are confident that this improvement will justify the effort we shall put forth to make The Ice Cream Review "a thing of beauty and a joy forever."

We feel that the paper "dressed up," as we hope to make it each issue, will better represent the great ice cream industry for which it "lives and has its being." Yes, we surely hope you like it.

AT ONE of the state conventions an ice cream manufacturer made the statement that he follows the practice of charging the retailers with the packers he furnishes them. He requires the retailer to pay one-half the cost of a packer, thus dividing the cost with him. He says that this plan has practically eliminated the trouble he used to have with strayed or lost packers. When the retailer has his money invested in the packers he is more careful in handling them and of course doesn't want to see them get lost. This is another illustration of the well known fact that most people are more careful with their own property than property which belongs to someone else.

THIS issue of The Ice Cream Review is mailed to a considerable number of ice cream manufacturers who are not on our subscription list. If you are one of these we particularly invite you to look this issue over carefully. Note the pages and pages of news about the ice cream industry and the valuable information about ice cream making problems. Note the character of the advertisements and the effort put forth in them to reach the ice cream manufacturers of the country. Surely these experienced advertisers would not make this effort unless they considered The Ice Cream Review worthy of it.

Unless you are interested in the manufacture of ice cream you will not enjoy The Ice Cream Review, but if you are thus interested, you need it in your business. You need to be in closer touch with the army of folks who are using the paper to boost their business and your business. And they need you. Come on.

Supply Men Will Hold National Show This Year

Their Association decides on Cleveland and invites the National Association of Ice Cream Manufacturers to Participate in Great Ice Cream Event

THE Association of Ice Cream Supply Men has decided to hold a National Show devoted to the ice cream industry this year.

The dates have not yet been announced, but the show will be held in the new Public Hall in Cleveland, the newest, best outfitted and most elaborate structure in the country for the holding of conventions and exhibitions.

The Association of Ice Cream Supply Men has extended an official invitation to the National Association of Ice Cream Manufacturers to hold its 1922 convention in conjunction with the Cleveland show. It has offered the National Association complete facilities and accommodations there.

In announcing that a National Show will be held by the supply organization, O. S. Jordan, its president, recently said:

"In the last three years it has been the policy of the Association of Ice Cream Supply Men to promote and manage regional exhibitions for the benefit of the ice cream industry. Six such exhibitions have been held since November, 1919: In Philadelphia, St. Louis, Atlantic City, Portland, Ore., Buffalo and Atlanta. These six regional exhibitions have done their work well. They have aided incalculably, if we are to credit not only our own observations, but the voluntary testimony of many ice cream manufacturers in giving a more modern, scientific, unified and ambitious trend to the ice cream industry of each section. They have been pre-eminently a service to the ice cream manufacturers of each section.

"This year we believe the time has come to hold one great National Show in the same spirit of service to the industry. Business and industrial conditions point to the greater efficiency of one great show. The ice cream industry itself is in a condition better to profit from such a single great show than from smaller regional exhibitions. The ice cream industry is more truly a single national, forward-looking industry today than at any time in the past. Its spirit as well as its practical needs incline it toward a desire for such a great National Show.

"The show to be held in Cleveland will be incomparably the greatest exposition of the ice cream industry ever made. No effort will be spared to make it all inclusive, elaborate in detail, practical and serviceable in spirit. More literally than at any time in the past our association believes that, in preparing for this great National Show, it is laboring in the service of the industry to which its members cater."

The association on February 11th officially invited the National Association of Ice Cream Manufacturers to hold its annual convention in conjunction with the exhibition. This invitation was extended upon authority of the Board of Directors of the association and in the following form:

The National Association of Ice Cream Manufacturers,
Attention Mr. Charles G. Morris, President,
Care New Haven Dairy Company.
New Haven, Conn.

Gentlemen:—

It is our pleasure herewith to extend to you an invitation to hold the 1922 convention of the National Association of Ice Cream Manufacturers in conjunction with a National Exhibition in the service of the ice cream industry to be held by our organization in Cleveland, Ohio.

It is the purpose of the Association of Ice Cream Supply Men to hold one large exhibition only in 1922, and that of a national character, and to make it a record-breaking expositional event for the ice cream industry of the country as a whole.

The completion of the new municipal convention and exhibition hall in Cleveland gives that city the premier accommodations for such an industrial gathering as a joint convention-and-exhibition of the National Association of Ice Cream Manufacturers and the Association of Ice Cream Supply Men would constitute, of any of the more centrally located larger cities of the country.

The acceptance of our invitation by your board of directors will immediately be followed by the working out of present tentative plans, in co-operation with your own officers, providing for the bringing of the maximum attendance to your convention and the supplying of the most complete facilities and conveniences for your meeting, upon such a scale and in such detail as will afford the National Association of Ice Cream Manufacturers a record-breaking gathering. Held simultaneousuy with the convention, but its hours and conduct so arranged that it will not interfere with the regular convention proceedings, will be assembled and opened to the inspection of ice cream manufacturers the most comprehensive, carefully prepared and educationally and scientifically modern exposition of supplies, machinery, services and equipment ever held.

Such a national exhibition in the service of the ice cream industry, it is believed by our organization, is distinctly called for by present conditions and will be held regardless of the action taken upon our invitation.

It is our hope that this letter of invitation will be transmitted in full, and in due form and time, to your several directors, and that we may before long receive word of the acceptance of the invitation. We believe it unnecessary to reaffirm at this time our proved devotion to the interests of the ice cream industry, interests in their broader manifestations identical with our own, and to the advancement of which a combined National

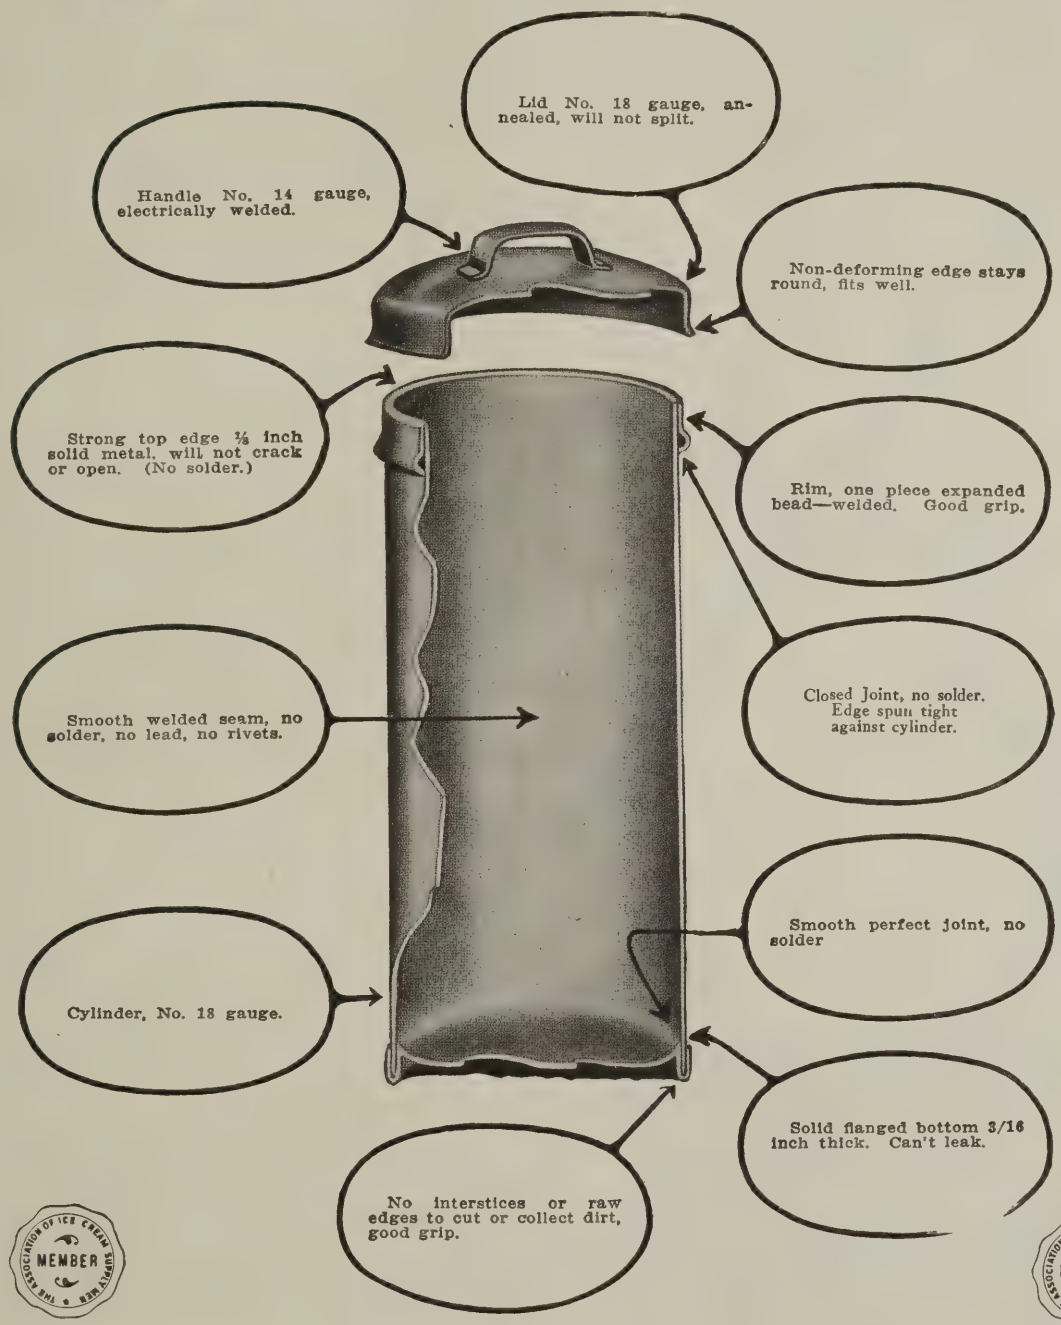
WELCOME, NORTH DAKOTA!

The Ice Cream Review:

This is to notify you that we have adopted The Ice Cream Review, by unanimous vote, officially, as the official Organ of this Association, and you may hereafter carry our name on your roster.



Yours truly,

THE NORTH DAKOTA ICE CREAM MNFRS. ASSN.,
O. A. Amundson, President.

Electric Weld

RIVETLESS SOLDERLESS ICE CREAM CANS

should be judged on a basis of the ratio of cost to service. The can that makes the most trips for the least cost is cheapest. We have other important features. **One-Piece Construction** securing all the advantages and none of the disadvantages of seamless can.

PATENTED

Electric Weld Rivetless-Solderless ice cream cans are easily and cheaply retinned, for they are ALL STEEL and PURE STRAITS TIN. No unnecessary weight, for due to absence of solder and rivets.

WRITE FOR NEW LOW PRICES.

Wisconsin Association of Ice Cream Manufacturers

Proceedings of the Seventh Annual Convention held at Hotel Plankinton, Milwaukee, Wis,, January 17 and 18, 1922

First Session—Tuesday, 10:30.

Meeting called to order by president, D. D. Smith of Fond du Lac.

President: We have with us this morning for the address of welcome, Honorable John M. Niven, City Attorney of Milwaukee.

ADDRESS OF WELCOME.

Honorable John M. Niven, Milwaukee, Wis.

.. Mr. Chairman and Gentlemen: It is ordinarily the privilege of Mayor Hoan or President Corcoran, of the Common Council, to give the address of welcome, possibly you are unfortunate in not being able to hear the eloquent words of the Mayor or the rich Hiberian brogue of Mr. Corcoran, but the work has to be divided. It is always popularly supposed that one of Scotch descent is particularly adopted to give something like a welcome which comes without price and without compensation. So they selected one of that rational predilection.

We are very glad to have all of you gentlemen come to Milwaukee. Milwaukee has had a reputation for years for its convention facilities and for the wholesouled and hearty welcome it extends to those who visit the city. It is a matter of regret, or a matter of good fortune, as you may individually decide, that Milwaukee has not some of the facilities of entertainment we had formerly. Possibly in a convention of ice cream manufacturers and dealers, it is a matter of good fortune that the competition which Milwaukee used to afford to your product is probably not as keen as it was in years gone past. I sometimes think that the time of the ice cream man is coming as the time of the brewer goes.

Sometimes I think that the reputation that Milwaukee had on account of the brewing industry was a detriment to the city because the people around the country got the idea that about all we had in the city were breweries. While brewing was a large and important industry in Milwaukee, the very excellent advertising which those concerns gave to our city, obscured many of the larger and more important industries that we have. It is, I believe, the fact that brewing was the seventh industry in point of importance, although from the advertising, the world has generally thought it was the very first. Now we are beginning to realize that there are many other interests the people of this city are engaged in, that you people are engaged in and that we have to offer to the world.

We are proud of our home city, we are glad to welcome you people from the state or from other states to Milwaukee. We are proud of our schools, we are proud of the high average of intelligence of our citizens, we are proud of their steady going qualities, of their ideas of government, and of their obedience to law and order.

We are a city which is primarily a city of manufacturing industries. When you want to realize what Milwaukee means, you don't go down its main street and look at its main section, you go out along our rivers, along our railroad lines, up the slips, and you view the magnificent factories that extend for miles and miles in every direction, and then, and not until then, do you realize what it is that constitutes the real backbone of this great city of ours. You can't understand it by walking down Grand Avenue or Wisconsin Street. You can't realize it by looking at the retail or shopping industries like Minneapolis and St. Paul, because it is a very different sort of a city, but we who have been here are proud of it, are proud of the character of our citizens, we are proud of our homes, we are proud of the fact that more of our people own their homes than nearly every other city in the world. We are proud of our climate, and we claim there are only two cities in the United States of anywhere near the same size that have a better health rate than Milwaukee.

We are glad to welcome you fellows here because we are beginning to understand that no man can live for himself alone, that no industry can live for itself alone, that no city can live for itself alone. We have gone through a great world war to determine that no nation or no people even can live for itself alone, and that there is something that units every one of us with every other person in the world, that we have responsibilities which extend beyond the confines of our own home, beyond the confines of our own municipality, our own state, and even of our own country.

I am glad to see you people here meeting in convention because I am firmly convinced that association is one of the things we have got to have if we want to get along right in these days. I am not talking about the purely financial benefits that come from association, but I am speaking about the broader, the greater and more lasting benefits from the intermingling of men of kindred business and kindred ideals, and necessarily common aims and common responsibilities.

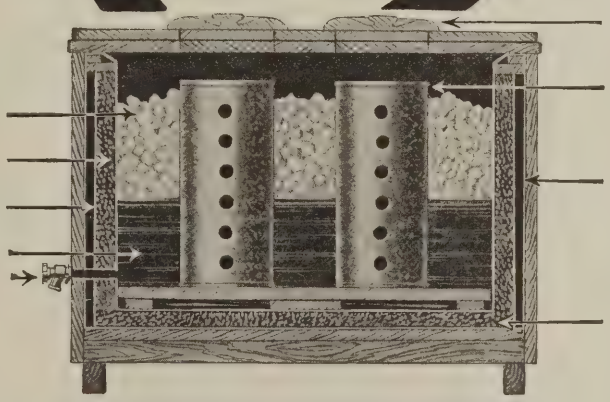
If you look back over the history of the world, you will find that from the very beginning of time, there has been gradually and slowly, but steadily growing the idea of association. There never was a time in the history of the world when there was not association, except in the very beginning of time. That was the time when we had personal liberty, we hear so much about, when the only right, the only power that there was, was the power of might and gradually, as a matter of self-protection, we find developing out of that, association, and we find the family uniting, then the several families uniting into a tribe, then several tribes into a nation, and finally we have got to a higher stage of development, when nations are uniting for the common good. That is a real tangible benefit, and the sooner we people begin to realize we have got to get together and work together, the better off we are going to be.

Did you ever stop to think that your friends are the best fellows in the world? There isn't a single one of us who doesn't realize that his friends are a little bit better than any one else. My friends are a little bit better than Mr. Smith's friends, as I believe, and his friends are doubtless better than my friends, as he believes. It is not because my friends are better than yours, or your friends are better than mine, but because I know my friends better, and you know your friends better and when you get to know a fellow, whether he is a competitor of yours or in another line of business, you realize he is a pretty decent sort of fellow. You realize his faults, but you forget his faults because you realize his good qualities. So it is that we have associations with the primary purpose of many of them to inculcate those ideals of fellowship, of making one acquainted with his competitors, with those in other lines of business so that they will realize after all we are good fellows when we realize we are going

Our Guarantee

We guarantee our cabinets to keep ice cream in perfect condition from 24 to 30 hours with one packing. If it does not, return at our expense and we will refund purchase price.

"NO-SWET"



The Sweatless Cabinet

to get together and think of something besides our own selfish purpose. And what do we find? That our competitors are pretty decent fellows and we will say, "I am not going to fight that fellow, he is a pretty decent sort." That chap has his good points and I am not going to worry about him any more," and then you are going to think about what you are going to do for your community, for your state, and your country. You are going to think about something besides the confines of your business and there the real hope of the nation lies, that the every day business and professional man, the every day worker is going to devote a little time to his civic duties, to his civic responsibilities.

We have election, and nine out of ten people don't know who they are voting for. Nine out of ten, don't know what the officer they are voting for has to do when he goes into office. They are voting on measures and they don't know what those measures mean. They are voting in the dark. They are passing on measures with which they have no concern and no knowledge. Everybody should realize in these days we have got to sense our responsibility to our city, our state, our nation, to our neighbor; when we do we are not going to have so many evils to remedy, because as we go along everything will be taken care of along the way. That is old stuff you may say. I know it is old stuff. I am not trying to tell you anything new, but I am trying to impress it upon you as I see it from the standpoint of one in public life, to some extent, that we need the co-operation, we need the interest, we need the support of you men who are in business. That applies through all the walks of life. Milwaukee needs you. Milwaukee can't live for a week cut off from the rest of the world, and none of your cities can live for a week cut off from the rest of the world. Milwaukee is not one part of Wisconsin and the rest of you another. We are all a component part of one great state, and we have all got to work together for the common good, because our civilization has got so complex that no one and no city can work for itself alone. We have all got to get together and pull together for the common good.

I simply want with those ideas, thrown out more or less at random, to close with the renewed welcome that we are glad to extend to all of you who come to Milwaukee. It is evidence of a closer feeling of all peoples in kindred industries. We are glad you can come down and see what we have to offer you and we are doubly glad because it means that the whole state of Wisconsin is getting together and you are going to work out in your own way those things that will make for the betterment of yourself and the betterment of the community.

I thank you.

Applause.

President: We certainly appreciate the address given by Mr. Niven and in response to the address of welcome we have with us, one of the live wires of our industry, Mr. Charles Touton.

RESPONSE.

By Mr. Charles Touton, Janesville, Wis.

I am not a public speaker, I don't know how they can bear to pick on me, I don't see for the life of me what anybody can have to say after this man's talk, but nevertheless we thank Mr. Niven for the worthy address he has given us.

I will admit last night sitting and standing around the lobby it was kind of a longing feeling for something that used to be here. Once and a while, some fellows would sneak over and ask us to go with them and we would go but we got nothing but near beer. We came back to the hotel and someone else would take us off.

I wonder if Mr. Niven realizes that there are some other cities in the state besides Milwaukee. We have a lot of good cities in the southern part, in the western part, in the northern part and they are also industrial and manufacturing cities. We have some interesting places to offer the people for touring and we have some wonderful roads outside of Milwaukee and Milwaukee county. Out through Rock county, up north, take around Kilbourn, is one of the most scenic trips one can take and some place on the route, you will have to pass somebodies ice cream plant or sales room and that all helps to add to the sale of the product. I often wonder to myself, if the different cities realize what the ice cream manufacturer means to the city. Take for instance your Milwaukee industries; I have thought of this several times. I wonder if your city and our city really realizes what the ice cream plant means to them. Every dollar that is taken in and disposed of in your plant is turned right back to the city. These extract men sitting around here, who put up our strawberries, etc., get some of it, but aside from that really every dollar we take in is put right back into the community and the farmers of this locality of ours and in southern Wisconsin are in mighty good shape. They are getting their little milk check the first of every month. I really think those are things to consider and when you go home talk up to your merchants. You are a small plant, but at the same time, I think you are entitled to all the credit we try to turn out and the state of Wisconsin certainly ought to be proud of the ice cream industry.

Again I want to thank Mr. Niven on behalf of the association for the very eloquent response. As far as I am able, I will keep these fellows straight and out of jail. Of course I can't watch all of them.

Applause.

President: The next number on our program is "Ice Cream Standards," by Mr. Harry Klueter, assistant dairy and food commissioner, Madison.

"ICE CREAM STANDARDS."

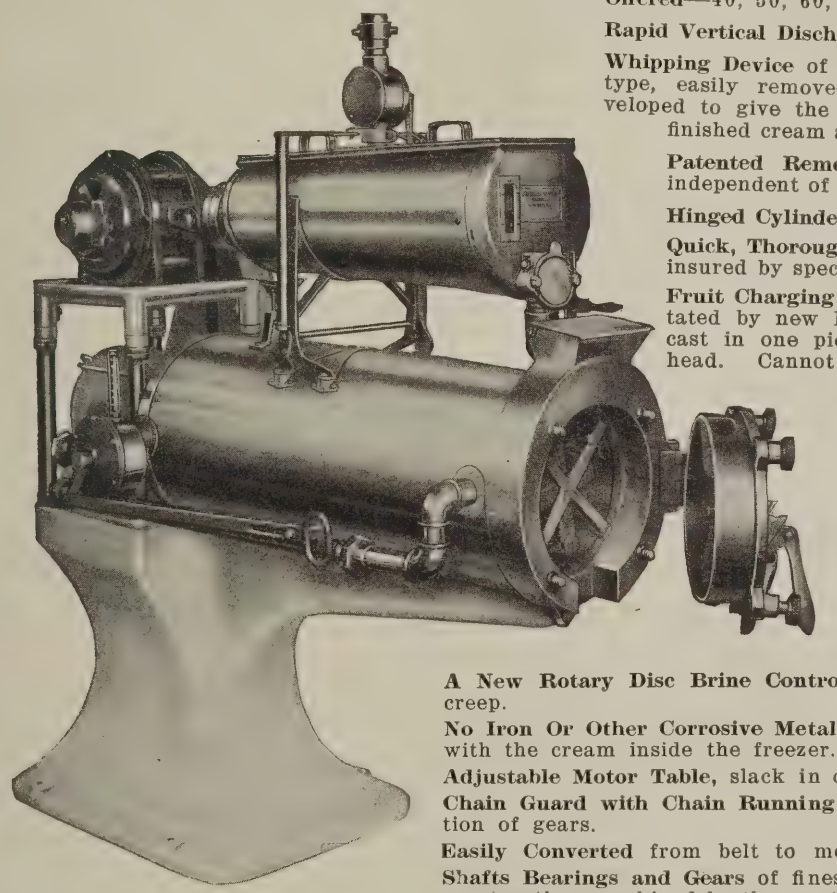
By Mr. Harry Klueter, Madison, Wis.

Mr. Smith, ladies and gentlemen: Lest I might forget some of the things I want to say, I took occasion to put them down in writing.

I consider the subject of "Ice Cream Standards" is one of the most important subjects that might be discussed with your organization.

Before, however, proceeding directly to the subject of ice cream standards, I thought it might be of interest to you to know something of the origin of ice cream. I have therefore gone to the literature on the subject which I can assure you is not plentiful, but is however very interesting. In an article on the origin and development of the ice cream industry we find the following information, due to the efforts of Mr. Frank M. Buzzell, who is credited with the same. From motives of comfort and health, the instinct of man in all ages and climes has been to maintain his physical, if not his mental being, at a temperature as nearly normal as possible. Thus we find the natives of Iceland and other very cold climates living upon heat producing foods, fats, tallow candles and such delicacies, while the South Sea Islander lunches on a little fruit or cereal or other foods producing a minimum of body heat. This rule applies also to liquid refreshments. Hot weather creates a demand for cooling drink and vice versa, and we, in our today, when we sit in the coolest spot to be found on some sweltering August night and sip our favorite cold drink are actuated by the same motive which

The Last Word in Modern Freezer Construction



U.S. Heavy Duty Freezers

Produce the finest texture of clean, velvety ice cream with the fullest desired overrun. They turn it out in quick time, with the least labor, attention and power, and require the smallest manufacturing space.

They have won the cordial appreciation of hundreds of Ice Cream Manufacturers in all parts of America.

Where Else Can You Find Such a Combination of Advanced Features and Exclusive Advantages?

Roller Bearings optional on all sizes. (Best grade Standard Government Bronze Bearings used where Roller Bearings are not specified).

Automatic Batch Weigher—simple, positive, reliable, gravity operated, optional on all sizes.

Widest and Most Complete Range of Sizes Ever Offered—40, 50, 60, 80, 120, 140 and 160 quarts.

Rapid Vertical Discharge.

Whipping Device of most approved double dasher type, easily removed, cleaned and replaced—developed to give the finest velvety texture to the finished cream as well as the desired overrun.

Patented Removable Bearing and Support independent of cover, for front end of dasher.

Hinged Cylinder Cover on All Sizes.

Quick, Thorough Mixing of fruits and flavors insured by special cover design.

Fruit Charging and Inspection greatly facilitated by new Fruit Hopper and Peep Hole cast in one piece with the bronze cylinder head. Cannot become airbound.

Simplified Cream Passages easily accessible for cleaning.

New Rotary Disc Cream Valves throughout, reliable in action, few and simple parts, easy to take apart and reassemble.

A Cream Can made with solid cast bronze ends. Outlet valve housing cast in one piece with end of the can.

A New Rotary Disc Brine Control Valve, won't leak, stick or creep.

No Iron Or Other Corrosive Metals to wear or come in contact with the cream inside the freezer.

Adjustable Motor Table, slack in chain easily taken up.

Chain Guard with Chain Running in Oil, also insures lubrication of gears.

Easily Converted from belt to motor drive and vice versa.

Shafts Bearings and Gears of finest materials and extra heavy construction, machined by the most improved scientifically correct methods.

Brine Jacket and Passages that do not clog up easily or leak, yet are readily accessible for inspection and cleaning.

Bolted-Together Unit principle of assembly, all parts interchangeable.

No Soldered Joints to open up and leak.

A Really Heavy-Duty Machine.

May we not arrange to have one call on you?

has influenced our ancestors from the more recent past back to the days of Job and Solomon the Wise.

The Bible tells us indirectly that the people of Palestine knew and appreciated the refreshing quality of snow in time of harvest. The Jews, the Ancient Greeks and Romans were all accustomed to the use of snow for cooling wines and other beverages, and it is still used today in this way in certain parts of Spain and Turkey.

Alexander the Great is said to have been very fond of iced beverages. Snow and ice were used at the table in the court of Henry the Third of France in the hot summer months.

The Italians it is claimed made the first improvement in the original method of cooling, which improvement was to dissolve salt petre in water and pour a little of this solution in with the snow and ice surrounding the dish to be cooled. Later it was found that better results were attained by dropping the salt petre directly into the snow and ice and at the same time revolving the vessel containing the substance to be cooled. By this means the mixture in the vessel could be brought to a fairly solid state. Wines were commonly iced in this way, then water sweetened and flavored with various fruit juices or other flavorings was made into a sort of water ice. Water ices and such refreshments are still the rule in the orient today, while ice cream as we know it is rare.

There is no reliable record of the first water ices, dates and places are either lacking altogether in the vague allusions made to them or are so indefinite as to be of no value. From water ices to mixtures containing milk or cream and eggs was apparently a logical progression, but history is vague on the question of who first made ice cream.

It is recorded that in Rome a certain Quintus Maximus Gurges, nick-named The Glutton, a well known writer of those times on subjects pertaining to the table, wrote a recipe in one of his books for a dish that somewhat resembled ice cream. The name ice cream is one of modern origin, the original terms being butter ice or cream ice, the latter being that favored in England. The earlier forms after the ices containing milk or cream, which were really the first ice creams known, were called butter ice probably because of their rich butter like consistency, being made from rich cream and spaddled. Cream ice is said to have been known in Paris in 1774. Cream ice is mentioned in an account of a banquet given by Charles First of England.

The dish was made by a French cook named De Mireo and it is related that the king was so well pleased with the frozen milk, as he called it, that he pensioned the cook with 20 pounds a year on condition that he would not divulge the secret of making the desert or make it for any one but himself.

Another account says that the first ice cream was set before Duke De Chartras on a hot day in August, 1774, by his chef, who had depicted the duke's coat of arms on the cream. Again we find in an account of an entertainment given by Louis XIV (fourteenth) of France, that toward the end of the feast a chef caused to be placed before each guest in a silver gilt cup what was apparently a freshly laid egg, colored like those of Easter, but before the company had time to recover from their surprise at such a novelty at desert, they discovered that the supposed egg was a delicious sweet meat, cold and compact as marble. A French cook, Clairmont, residing in London, gave instructions for making sweet ices in a book, published in 1776. English cook books 150 years old give recipes for cream ices, in which cream and milk, sugar, eggs, arrow root or flour, and flavorings were used. Recipes have always varied according to the whim or desire of the maker. We deduct from the foregoing bit of narrative that ice cream was not apparently discovered, but rather was the result of a slow process of evolution, which was taking place in different locations at about the same time.

History states that ice cream was first sold in New York by a Mr. Hall at 75 Chatham Street, now Park Row. Ice cream is mentioned in an account of a ball given by a Mrs. Johnson, December 12, 1789, and was introduced to the city of Washington by Mrs. Alexander Hamilton at a dinner at which President Washington was present. She had become familiar with the dish in New York.

The first advertisement of ice cream appeared in a New York paper, the Post Boy, dated June 8, 1786, and reads as follows:

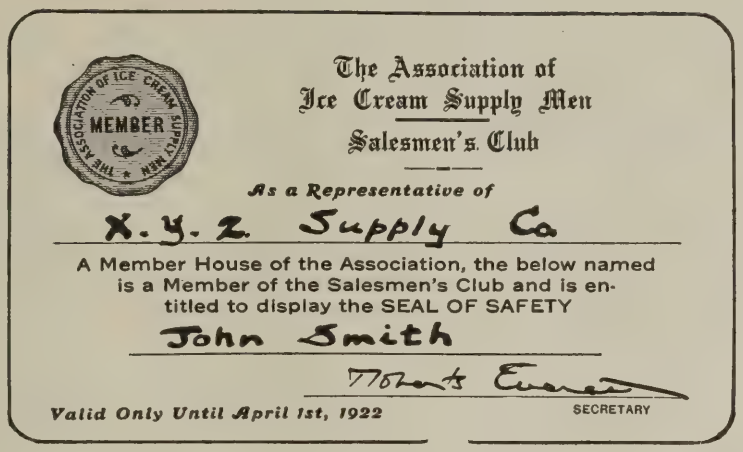
"Ladies and Gentlemen may be supplied with ice cream every day at the City Tavern by their humble servant, Joseph Crow."

A negro, one Jackson, who had worked at the White House after Mrs. Hamilton had introduced ice cream to President Washington, learned the recipe and started a confectionery. He sold his cream readily at $1.00 a quart.

Jacob Fussel is admitted to be the father of the manufacture of ice cream as a wholesale business. He entered this business in 1852, and from this beginning of the manufacture of ice cream in 1852 in a single plant in the United States, the industry has grown and developed until now every city of any importance has from one to several such wholesale plants.

Today ice cream is an important article of food. Its use is no longer confined to that of a desert on elaborate occasions, but it is a common and important article of diet and is indulged in freely by a vast majority of our people. In 1910 the estimated value of the ice cream manufactured for that year was placed at one hundred million dollars. Just exactly what the value is today I would not dare say, for we know that its use has increased steadily and I do not believe it would be over stating this increase if it is put at ten times the production and consumption of ten years ago.

An ever increasing demand for ice cream and its new uses in the American dietary have made necessary a study of ice cream with a view to standardization.



Food officials, like weights and measures officials, need standards.

Why? As you determine the correctness or accuracy of measuring and weighing devices by comparison with standards; so we after chemical analysis to determine the composition of many foods, decide whether such foods are legally saleable by comparison with standards for such foods fixed by legislative enactment. Wisconsin's new standards for ice cream are such standards.

Foods may be divided into two classes for the purposes of standardization. Those natural food products like milk, honey, spices, meats; and manufactured foods such as vinegars, flavoring extracts, butter, cheese, evaporated milk, cream and many others.

In standardizing natural foods, certain minimum requirements as to the percentage of one or more of the constituents may be established, as in milk. In the case of milk the Wisconsin standard requires a minimum of 3 per cent of fat and a minimum of 8½ per cent of solids not fat; milk containing less fat or solids not fat is adulterated milk. Or as is the case in the standardization of spices, a minimum percentage may be set for one or more of the constituents such as oleoresin or the volatile oil, but it is necessary to go a step farther and establish a maximum percentage for certain other constituents such as ash, starch and moisture. How is the

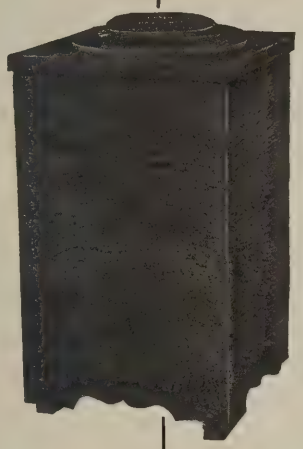
Michigan Convention and Show Big Success

THE annual convention and dairy show of the Michigan Allied Dairy Association, held in Saginaw, February 14-17, was pronounced by everybody the most successful ever held in that state, which has the record of holding the best state show of any of the states and is second only to the national. The Auditorium was jammed with exhibits both commercial and educational. It being reported by the management that only half of those who sought space could be taken care of.

The exhibit by the U. S. Department of Agriculture was the feature educational exhibit, and was inspected liberally. The dairy products exhibit arranged jointly by the Michigan Agricultural College and the State Department of Agriculture was of great interest to convention and show visitors, and reflected truly the diversification of the dairy industry in Michigan.

The Auditorium was opened to the visitors and the public promptly on time, with all exhibits in place. The first general session scheduled for 10 A. M. Tuesday morning was a revelation to old time convention followers, in that the session was called promptly on time with most of the seats in the banquet hall in the Auditorium filled. F. E. Hollweg, with the Thos. W. Dunn Co., of New York City, functioned at the piano, playing America while the Colors were borne in and placed at the speakers' stand while the crowd sang. Glen Overton, president of the Michigan Allied Dairy Association, then called the convention to order, when the divine blessing was invoked upon the occasion by the Rev. Mr. Montgomery of Saginaw. Mayor Ben N. Mercer welcomed the visitors to Saginaw in a manner that left no doubt in any mind that all were truly welcome. W. W. Marple of Chicago responded to the mayor's address of welcome in his characteristic manner, ending with Marple's "Eulogy to the Dairy Cow."

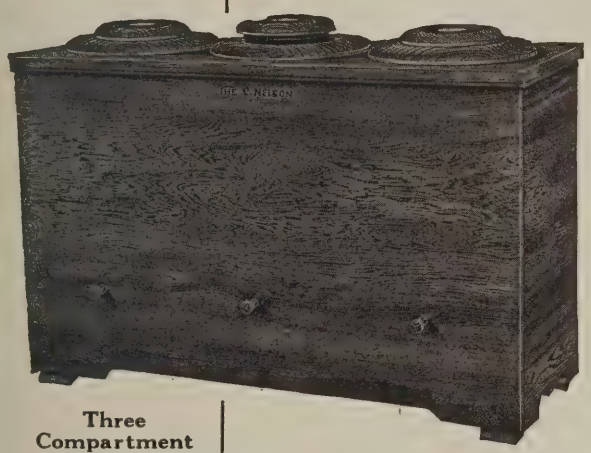


President Overton's annual address was full of real meat, and is published in this issue. The annual report of the secretary-treasurer, Mr. H. D. Wendt, of Lansing, showed the association to be in a good financial condition. Mr. Wendt also discussed and emphasized the necessity of improving the character of dairy stock, and took up other points of interest to dairymen.

The afternoon general session was addressed by the Hon. H. H. Halladay, commissioner of agriculture of the state of Michigan. Mr. Halladay's address is also published in this paper. Col. M. D. Munn, president of the National Dairy Council, was the other speaker on the afternoon program, and discussed the work of the Council and the results that it was getting in increased consumption of dairy products through the educational campaigns now being conducted at various points throughout the United States.

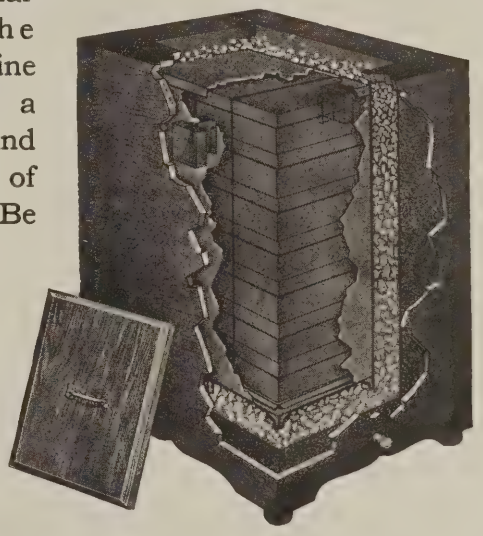
Wednesday was given over to unit meetings of the Creamerymen and the Ice Cream Manufacturers. "Jake" Kindleberger of Kalamazoo "starred" at the creamerymen's session with an address that will be remembered by all who heard it, as it was truly an inspiration to those who are struggling with the problems of the hour. W. W. Marple next discussed "The Yellow Peril." Mr. Marple has confessed that it took him three weeks to prepare his paper. Roy C. Potts of the Bureau of Markets, closed the meeting with a discussion of "Future's Yardstick" in which he emphasized the importance of quality as essential in the marketing of dairy products. At the ice cream meeting Prof. O. T. Goodwin of the Michigan Agricultural College, spoke on the subject of "Bacteria in Ice Cream" and on the results of some work in making carbonated ice cream. Ed. Slater, editor of the Butter, Cheese and Egg Journal, The Ice Cream Review and The Milk Dealer publications, was unable to attend, but sent a paper which was read by Mr. L. S. Olsen. There were in addition to these numbers the usual reports of the officers.

Wednesday night was the time of the general banquet of the allied association. This was pronounced the best dairy banquet ever staged in the memory of many of the old timers, not even excepting dairy banquets of national associations. The banquet hall at the Bancroft Hotel was utterly unable to seat the crowd and overflow tables were set on the mezzanine floor and in the regular dining room. "Father" Marple acted as toastmaster, 'nuf said. Short talks were made by Prof. A. C. Anderson, W. A. McDonald, A. E. Williams, Prof. O. T. Goodwin, John W. Ladd, Roy C. Potts, Glenn Overton, H. D. Wendt and Roy Frary, who presented Mr. Marple, in behalf of the Allied Association, a framed three verse eulogy of his own composition. The entertainment at the banquet was of a high order and was very much appreciated. Special mention is due the dairy firms of Saginaw, who made special contribution to the entertainment. After the banquet the hall was cleared and the dance was on, which lasted until one o'clock in the morning.



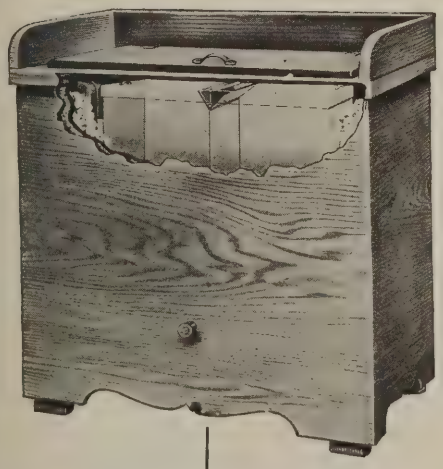
Thursday forenoon was again given over to unit sessions of the ice cream manufacturers and the Creamery men. T. H. Brouthon, of the Michigan State Department of Agriculture, read a paper on the subject of "Department Policies" at the ice cream session, and N. Loewenstein, Secretary of the National Ice Cream Manufacturers Association, discussed the subject of chocolate covered ice cream. The creamery men's session was devoted entirely to business, reports of committees, election of officers, etc. Following are those who were elected as officers and directors of the Michigan Association of Creamery Owners and Managers. President Glen Overton, Allegan; Vice-President W. A. Ross, Detroit; Treasurer E. G. Cooper, Detroit; Directors A. C. Anderson, Flint; Oscar Vasold, Midland; Roy Riley, Marlette; Martin Seidel, Bay City, and Mr. Ralston, Kalamazoo. The Ice Cream Manufacturers elected directors: N. J. Dessert, Detroit; J. J. McDonald, Owosso; Glen Cowan, Detroit; L. S. Wilson, Port Huron; John Kelley, Grand Rapids; A. E. Williams, Saginaw, and W. H. Bechtel, Caro. The directors elected for the Allied Association are: Glen Overton, Allegan; Martin Seidel, Bay City; Roy F. Frary, Lapeer. For the butter section—N. J. Dessert, Detroit; F. J. Fleming, Jackson; W. H. Bechtel, Caro. For the ice cream section—N. P. Hull, Lansing; John C. Naar, Flat Rock; R. C. Read, Howell; Ray Potts, Washington; C. L. Brody, Lansing; M. L. Noon, Jackson. For the State Farm Bureau and the Milk Producers' Association—C. H. Parker, Saginaw, and W. J. Kennedy, Detroit. For the Market Milk Distributors—Peter Van Allsburg, Grand Ledge, for the condensed and milk powder manufacturers, and R. A. Page, Zeeland, for the cheese manufacturers. The Supplymen ("Boosters") have as their members, on the Allied board, D. W. Shiel, Hillsdale; R. J. Elwanger, Grand Rapids, and C. J. W. Smith, Detroit. The Boosters also elected as their President, C. J. Yuncker, Toledo; Howard Black, vice-president; and re-elected C. J. W. Smith, secretary-treasurer; and R. J. Elwanger, Grand Rapids, and Mr. Keating, also of Grand Rapids,

Nelson (Patented) Ice Cream Cabinets



"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"



Three Compartment Cabinet

C. Nelson Brick Cabinet
Patented May 8, 1906

42 Qt. Brick Cabinet with Ice Rail

Patented Nov. 11, 1919—1321120

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Plan on your season's requirements now, and have your supply on hand when needed.

C. Nelson Manufacturing Co.

2308 Division St. **St. Louis, Mo.**

as directors. The officers of the Allied Dairy Association will be elected by the board of directors at their next regular meeting at Lansing on March 16.

Resolutions were adopted as follows:

Since another year of earnest effort of a million Michigan men engaged in the noble business of producing, manufacturing and marketing the product of the humble cow has passed in history, and this, the 38th annual convention, marks the close of another epoch, and since this convention, with its enthusiastic program sessions, its splendid machinery and supply exhibits, and the crowning event, a banquet, which will long be remembered in the minds of those who enjoyed its festivities, represents not only our esteem for the business in which we are engaged, but also reflects the result of the most hearty co-operation, good will and conscientious enterprise, therefore we

Resolve, That our appreciation be expressed to those on whom the success of this convention has rested. In this we are particularly mindful of the efficient services of Mr. Wendt and his various committees in their selection of talent, engineering of arrangements and execution of plans. We further

Resolve, That we are highly appreciative of the hospitality of the City of Saginaw, of the hearty, loyal and unstinted co-operation of the Saginaw Board of Trade, and of the press, both trade, state and local. We are also not unmindful of our obligation to the Federal Department of Agriculture for the wonderful demonstrative exhibit and to the Michigan Central R. R. for their free transportation of same; likewise, we would remember the State Department of Agriculture and the Michigan Agricultural College. That we have appreciated the efforts, the courtesies, and the hospitality of the Saginaw hotels, and particularly so, are we endebted to the management of the Bancroft Hotel, in caring for the 35 per cent over attendance of our estimated number at the banquet. We further

Resolve, That we are unanimous in our appreciation of the addresses that were so ably rendered and lent so emphatically to the inspiration of the convention. Likewise, we would express appreciation of the Saginaw Dairy Products Manufacturers for their contributions to our entertainment, the Phenix Cheese Co., and the Geo. Zeigler Co., for their contributions to the menu, as well as the mayor of Saginaw, and all others who have contributed to the successful and valuable convention and show. (Signed)

R. F. FRARY.
SIMON HAGEDORN.
R. J. ELWANGER.

* * *

Thursday evening there was an entertainment and smoker given by the Michigan Dairy Boosters, in the banquet hall at the Bancroft Hotel, which was a most enjoyable affair. Free tickets were given all those attending the convention. Over 400 were in attendance. Sweet cider and doughnuts were consumed in large quantities. The numbers on the entertainment program were all well received. John W. Ladd, of the John W. Ladd Co., Detroit, spoke before the gathering and obtained a rising vote of every person in the room that this year's convention and show was the best ever, and pledging their co-operation for a still larger and better convention and show next year.

* * *

PRESIDENT'S ANNUAL ADDRESS.

By Glen Overton, Allegan, Mich., President of the Michigan Allied Dairy Association, at the Saginaw Convention, held February 14, 15, 16, 17.

This is the 38th annual meeting of the organized dairy interests of Michigan.

Today, more than ever, agriculture is recognized as the foundation of national prosperity, and dairying has proven itself to be the most vital phase of agriculture.

As president of the Michigan Allied Dairy Association, it is my privilege and duty to again, briefly, bring to your attention, some outstanding problems, with facts and figures in which we are all deeply interested, and to the satisfactory solution of which we must continue to give our most sincere and best efforts.

The Michigan Allied Dairy Association now represents the affiliated interests of everyone engaged in the production, manufacture and the distribution of milk and its many products.

We are at the close of the second year of this new affiliation of dairy interests, and while much has been accomplished, in view of the many new problems and situations which continually confront us, we may at times feel somewhat discouraged, as to the results of our organized efforts.

The past year, however, will be an outstanding one in the dairy history of Michigan.

A new state administration has taken a very active interest in this great industry, and a much needed reorganization of state government has been successfully accomplished.

A Department of Agriculture is actively functioning; a Dairy Division has been created in the new Department of Agriculture, and competent, experienced men, who have the full confidence and undivided support of all of us are in charge.

Our Agricultural College is entering upon a new period of useful activity and the great organization of our actual producers has passed through its experimental stage, and is becoming one of the leading factors in the improvement of unsatisfactory conditions.

More than ever during the past year have the distributors and manufacturers of dairy products come to appreciate the problems and difficulties that beset the actual producers; and likewise, producers are more fully appreciating the fact that the manufacturer and distributor of the products of the dairy cow, has after all, a job with plenty of complications.

Thus we see that these powerful agencies for good are already at work, which promises much for the future, and with the better understanding and the closer relation between all the different branches of dairying, is sure to come better co-operation and greater confidence. We are passing through one of the most violent periods of economic readjustment.

Whether we are selling automobiles, merchandise, farm products or our own labor, we must face the fact that we are going to get less than we have been getting during the past three or four years.

A Definite and Practical Plan to Increase Bulk Ice Cream Sales

FROM the experiences of ice cream manufacturers (who have adopted the "Sealright Way") and from our own observation and investigation, covering a period of more than a year, there has evolved a remarkable Merchandising and Advertising Plan. . . . "It is the most important advanced step made in twenty years," writes one manufacturer. This "advanced step" is interestingly portrayed and plainly outlined in a beautiful Portfolio entitled, The "Sealright Way." It has been prepared at a considerable expense; consequently, it is not intended for promiscuous nor free distribution. Every user of Sealright Filling Machines will receive a copy, for it is the "connecting link"—pointing the way—to the greatest good he can obtain from the "Sealright Way." Sealright Representatives will gladly show you this Portfolio when next calling on you. You should, by all means, take the time to study the plan as outlined in this Portfolio. You are bound to be favorably impressed and sincerely concerned in the greater sales possibilities this plan affords.

Keep in mind, however that in developing the delicious taste and purity of our coatings, we have not, for one instance, neglected its practicability from the manufacturers' standpoint. The ingredients are mixed to the right consistency to dip properly on ice cream, producing a smooth uniform coating.

MILWAUKEE **ELINE'S** WISCONSIN

SAND.

"Sandiness" in ice cream, a trouble frequently encountered by ice cream makers, soda fountain dispensors, and occasionally by consumers, can be prevented by keeping the milk sugar content of the ice cream low enough, and by keeping the storage temperature of the ice cream low, according to H. H. Sommer of the dairy department of the University of Wisconsin.

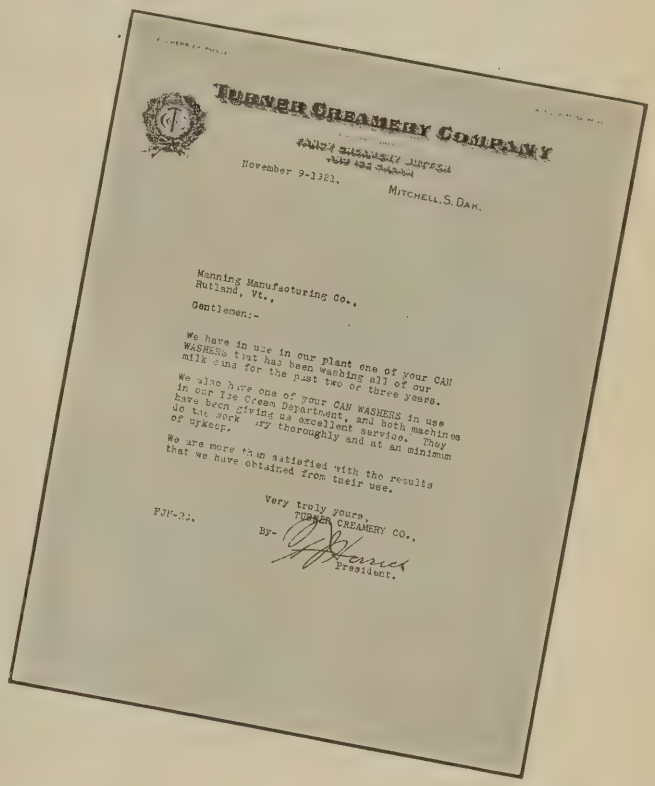
"Sandiness" is a grainy, gritty texture caused by the crystallization of the milk sugar, says Mr. Sommer. "This condition was unknown a few years ago before ice cream makers started to increase the Solids Not Fat content of their mix by adding milk products such as skimmilk powder, condensed milk, and sweetened condensed milk.

"By adding these dairy products to the mix, the manufacturers found that the resulting product had a smoother texture and gave a bigger over-run, two conditions very much desired by the manufacturer. These additions frequently raise the total solids content of the mix as high as 38 to 40 per cent. The milk sugar is found in the Solid Not Fat portion of the mix so that an increase in this content increases the possibilities of crystallization. To prevent 'sandiness' the Solid Not Fat content should be below 13 per cent."

Other causes of this ice cream defect as given by Mr. Sommer are, super-cooling of the mix in the freezing process, and also the fact that lactose crystals present in the sweetened condensed milk added to the mix, act as a "starter" for crystallization. Sandiness generally occurs in the "hardening" room at the factory. The mix is taken from the freezer in a semi-liquid condition and is then placed in the "hardening" room where the temperature is kept quite low. The ice cream remains here until hard. In some factories using the same kind of a mix only certain of the plants have trouble with "sandiness." Mr. Sommer attributes this fact to a variation in temperature in the hardening room. As long as the mix is kept below the cryohydric point, that temperature at which all the water in ice cream is in a solid state, crystallization of the milk sugar is not likely to take place, maintains this ice cream specialist.

It often happens that in drug stores and ice cream parlors the ice cream becomes "gritty." Mr. Sommer explains this occurrence as being due to the fact that the ice cream is iced when put in the cabinet, and as the ice melts considerable during the day, the ice cream that is left from the day's business is iced again at night. The flucuation in temperature causes a crystallization in the left-over ice cream, and the manufacturer is often blamed for this condition whereas the fault lies with the lack of care given the ice cream after it left the factory.

"The only aid to 'sandiness' in ice cream that pasteurization of the mix renders, is that of dissolving any crystals that may be present in condensed milk added to the mix," declares Mr. Sommer.



CHOCOLATE COVERED ICE CREAM BARS NOT TAXABLE.

The commissioner of Internal Revenue has announced, through the National Association of Ice Cream Manufacturers, that the chocolate covered ice cream bar as manufactured and sold at the present time "consisting of an interior of hard ice cream with a chocolate coating are not such confections as are taxable under Section 900 of the Revenue Act of 1921." It is therefore not necessary for ice cream manufacturers of the chocolate coated ice cream bar to make any return thereon under this act.

"A Minimum Of Upkeep"

"They do the work very thoroughly at a minimum of upkeep" is the way this Manning user puts it—and that's about the whole story.

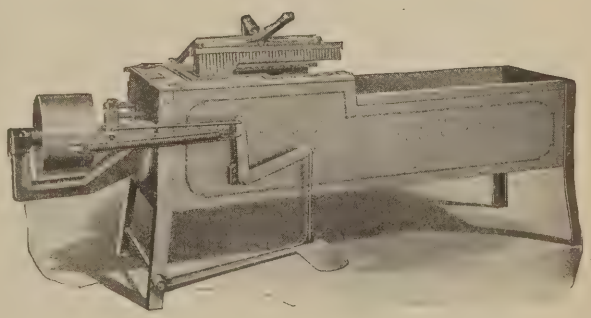
Next month a Manning user in Canada will tell you why he likes the Manning Can Washer.

TURNER CREAMERY COMPANY

November 9-1921. MITCHELL, S. DAK.

Manning Manufacturing Co.,
Rutland, Vt.,
Gentlemen:-

We have in use in our plant one of your CAN WASHERS that has been washing all of our milk cans for the past two or three years.



We also have one of your CAN WASHERS in use in our Ice Cream Department, and both machines have been giving us excellent service. They do the work very thoroughly and at an minimum of upkeep.

We are more than satisfied with the results that we have obtained from their use.

Very truly yours,
TURNER CREAMERY CO.,
By- President.

EVER HEAR OF ICE COLD CAKES SELLING LIKE HOT CAKES?

A New Test for Fat in Gelatine

By A. D. BURKE, Assistant in Dairying, and PAUL MENAUL, Assistant Research Chemist, Oklahoma Experiment Station, Stillwater, Oklahoma.

THE question "Why is it important to know the fat content of gelatine?" has frequently been asked. The answer is well illustrated by a number of tests for the "jelly value" and hardness of different samples of gelatine which have proved conclusively that as a general rule; in fact almost as an absolute rule, gelatine which contain fat even in minute quantities have a lower jelly value and are weaker, than those containing no fat or only a trace. The following typical tests will serve to illustrate this point:

Sample	Jelly Value	Hardness	Per cent Fat
1	3.0	65	.10
2	2.6	34	.05
3	1.8	15	.00

From the above table it may be seen that a knowledge of the fat content of gelatine is of primary importance since it gives an insight into the quality of the product and will assist the user of gelatine in selecting a standard material.

A quick practical method of determining fat in gelatine has long been sought but until quite recently the so-called "grease test" has been resorted to as a means of determining at least qualitatively the fat content of gelatine. In brief the "grease test" consists in making up a certain standard acqueous solution of gelatine, mixing with a small amount of a fat dye and smearing a brush of the mixture over a white sheet of paper. The fat particles being more highly stained than the surrounding film, appear as minute distinct spots and a relative test—at best only a poor qualitative test, is obtained. Obviously the method is impractical for use by the layman who is unfamiliar with the appearance of gelatine which may or may not contain fat when dyed and smeared on paper, and only to those persons continually operating such tests does the method really reveal anything regarding the character of gelatine so far as its grease or fat content is concerned. A method which is simple and yet reasonably accurate, not only qualitatively but likewise quantitatively should be a boon to manufacturers of gelatine as well as to those primarily interested in its use alone.

A method bordering along these characteristics has of late been devised by A. T. Seeker, chief, New York station, U. S. Bureau of Chemistry. The operation of the process consists essentially of digesting a 10-gram sample in a mixture of water and 10 cc. of conc. HCL in a flask, introducing the whole into a separatory funnel and shaking with 50 cc. of ether to dissolve the fat. The ether extract is then filtered into a previously weighed flask, evaporated to dryness and the flask reweighed after an hour's drying in a water oven.

Apparently the test seems simple and accurate and in order to test out its accuracy, similar tests were run by the writers, several determinations for fat being made on different and the same samples of gelatine. The results obtained, however, were not indicative of accuracy of the test. For example, one sample of gelatine known to contain fat was digested as above using the HCL, and boiled gently for 4 hours, while the resulting mixture was clear it yet remained very dark, thus indicating that some humin was formed. Extraction with ether and evaporating to dryness at a low temperature yielded a dark colored residue which did not consist of pure fat. This was proved by making further extraction with petroleum ether which dissolved the fat but left behind the dark substance. Tests using this further method of extraction yielded a much lower fat content than by extracting with ether alone.

The following are representative results obtained from a series of determinations using a sample of Know sparkling gelatine. Using Seeker's method* a fat content of .088 per cent and .098 per cent was found; if, however, the ether extract was washed twice with distilled water only .0325 per cent and .032 per cent of fat was indicated. When the dishes containing the dry residue from the ether extract were extracted with hot petroleum ether, and the fat determined by difference (that is, the residue soluble in petroleum ether) only .025 per cent and .02 per cent fat was indicated. This indicates that the ether extract of hydrolysed gelatine may contain other substances than fats.

From these experiments the writers are inclined to believe that some modification of the above test must be made if it is to become an accurate method for determining fat in all samples of gelatine. However, it is believed by us that in the majority of cases the method is sufficiently accurate for most practical cases and even though by further trial it should prove less applicable, it is nevertheless, apparently, a splendid step toward a simple, accurate method of determining fat in gelatine.

For the past year one of us (Burke) has been engaged in working out a test for fat in gelatine which would not only be simple, reasonably accurate and sufficiently delicate for use in gelatine factories but also practical for the ice cream maker, thus aiding him to detect a gelatine which contained no fat and indicating in at least one way the relative merits of the gelatine. A test apparently conforming to these requirements has

Your Friend Billy Bell
Has learned a thing or two About Vanilla Flavors

You see, I've been at this game one way and another for the last twenty-four years, ever since I was a kid. First as a Candymaker, then as an Ice Cream Maker, then as a practical Chemist and now I've been at the manufacture of Flavoring Extracts for the past eight years.

Remember "Marko" in the book "If Winter Comes?" Had a habit of "thinking things through." That's ME! Analytical sort of cuss. Never satisfied with half-way measures. Gotta get the "straight" of everything, looked at from all sides—impartially.

And all this time I was **working!** Working out a **dream.** Dream was to make a supremely good VANILLA COMPOUND — one that should have all the flavory delight of the pure bean extract; all the strength and staying-power of the synthetics; with none of the practical defects or disadvantages of either.

And I've GOT it! Grandest Ice Cream Vanilla in America judged by the **true** test—the taste of the **finished Ice Cream!**

"545"

After 544 attempts, some of which were mighty good, but not good enough for me—I **struck** it, on my 545th test—the climax of many years of trying.

That was two years ago.

And every day since then, the demand for "545" has been growing.

It's a case where every test means a steady customer; and my **only** problem is to get the stand-patters to realize that **I have** something that they **want**—and to put it to the test.

My "545" is 38% true vanilla and 62% vanillin, coumarin, essential oils, fruit flavors and other things—compounded by a special process that is mine alone.

2 qts. flavors 100 gals. Dairy mix or fully 200 gals. Ice Cream

And "the flavor **lasts.**" Just as richly delicious in cream two days old as when it leaves the hardening room.

Let me send you a 2 qt. sample for $1.90—the barrel price—or a 50 gallon barrel at $3.80 per gallon.

Wm. M. Bell
PRESIDENT
Tisco Co.

2 E. Lake St. Chicago

Northwestern Office
53 Metropolitan Life Bldg.
Minneapolis, Minn.

Southwest Office
208 E. Myrtle Street
San Antonio, Texas

been accordingly devised and the method of making it is as follows:

Make up a 50 per cent solution as follows: To 25 grams of gelatine add 30 cc. of a dilute sulfuric acid, specific gravity 1.25 to 1.3. The dilute H_2SO_4 contains about 35 per cent of sulfuric acid by weight. Mix thoroughly with a glass rod then set the beaker in boiling water or in a steam bath for 15 to 20 minutes, stirring occasionally. At the end of this time the solution will be liquid and free from bubbles. Cool the solution, pour into a 50 cc. graduated cylinder, dilute to the 50 cc. mark, mix thoroughly and add 18 cc. to each of two ordinary Wagner skimmilk test bottles reading to twenty-five hundredths of one per cent (25-100 per cent). Now add 20-25 cc. of sulphuric acid, a few cubic centimeters at a time, shaking after each addition until sufficient has been added to turn the solution a dark coffee brown. (Care should be taken in adding the sulphuric acid to avoid foaming and subsequent bubbling of the mixture from the bottle). Centrifuge for ten minutes in an ordinary steam Babcock milk tester running at a high rate of speed; preferably at 1,800 R.P.M. Fill the large neck of the bottle with sufficient water to bring any fat within the scale of the small neck and centrifuge a second time for ten minutes as above. Remove from the tester and read the per cent of fat multiplying the reading by 2 to obtain the per cent of fat in the original gelatine sample. The test is accurate to within .01 of a per cent of fat.

In order to prove the accuracy of the above test the following method was employed; one of us prepared a solution of fat free of gelatine by dissolving 40 grams of gelatine in 400 cc. of a 5 per cent sulphuric acid solution, boiling it for one hour under the reflux condenser. After this digestion the gelatine solution remained liquid at 15 degrees C at which temperature it was thoroughly extracted with ether to remove all traces of fat. Several determinations for fat were made by pouring the ether extract into a previously weighed dish, evaporating the ether and reweighing the dish, any fat being thus determined by difference. The extraction was continued until no fat was detected. Ether was removed from the original solution by cooling and the volume restored to 400 cc. with water.

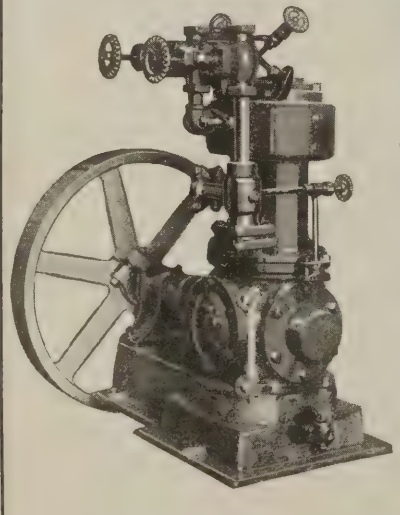
To prove that a correct determination for fat could be made by the Burke method detailed above, pure fat—hydrogenated oil, was weighed into skimmilk test bottles and 17.6 cc. of the fat free gelatine solution added. The fat was emulsified by shaking the warm solution and after standing for several hours no fat appeared on the surface. In this manner one of us (Menaul) prepared a gelatine solution in which the amount of fat was known. The samples were then sent to the operator of the Burke test to whom the fat content was unknown.

The results obtained were as follows:

Sample	Theoretical % of fat added by Menaul	% Actually obtained by Burke test
1	.020	.015
2	.016	.015
3	.012	.015
4	.100	.095
5	.200	.180
6	.042	.035
7	.390	.390
8	.041	.040
9	.160	.150
10	.220	.200
11	.250	.250
12	.074	.072

The percentage represented by the third decimal place .001 was of course estimated by the Burke method it being practically impossible to accurately determine this small amount from the scale on the Wagner skimmilk test bottle. However, it can readily be seen from the above experiments that any slight discrepancies are well within the limits of experimental error and that the method will detect fat contained in a gelatine solution.

A brief explanation of the chemistry of the Burke test is as follows: The dilute sulphuric acid serves to dissolve the gelatine in a 50 per cent solution without charring any particles of the gelatine contained in the mixture. Further hydrolysis is then aided by the addition of the final 20 or 25 cc. of sulphuric acid which liberates the fat from the gelatine solution and permits it to rise to the surface when centrifuged as in the test for milk.



From this the following method for figuring is evident; that the solution introduced into the bottle was one-half gelatine, therefore, the reading times 2 gives the percentage of fat in the commercial gelatine.

*Information regarding this test obtained from report of the Conn. Agr. Expt. Station on Food Products and Drugs, 1919, Part 1, Page 221.

WILL MANUFACTURE ICE CREAM.

Mr. Ed. Hofland, a Menomonie, Wis., dairyman, who owns a purebred Holstein herd, and H. J. Vigels, recently with the Waldorf Ice Cream Company of Akron, O., purchased a building and lot for $10,000 in Menomonie, Wis., and will engage in the manufacture of ice cream.

Machinery and equipment were purchased of J. E. Joyce, formerly of the Menomonie Dairy Company, in the amount of $4,000. A homogenizer and a cooler, purchased from the Creamery Package Company, have been installed. The building has been thoroughly remodeled and the company is now ready for the season's ice cream supply. They plan on manufacturing around 50,000 gallons a year. Mr. Vigels was at one time with H. P. Hood & Son of Boston, Mass.

DID You ever stop to think of the saving on reliable refrigeration with small and medium ice cream plants. They pay for themselves in less than a year.

Consulting us will prove these facts

We build complete ice cream equipments and hardening rooms. Also experts on Soda Fountain for mechanical refrigeration.

Our installations are simple in operation and money savers.

Write us your requirement for Ice Cream and Dairy plants.

ICE CREAM CABINET OF QUALITY

For Keeping Eskimo Pie in Perfect Condition

The Grand Rapids

Construction of Our "Zero Brick" Cabinet

Zero Brick Cabinet

Eskimo Pie, the new confection, which is meeting with such great success, must be kept in perfect condition to insure maximum sales.

Our Zero Brick Cabinet is ideally fitted for this purpose. The design is widely different from ordinary brick cabinets, one of the principal features being the separate covers for the Brick Tank and the Icing Compartment. The tank is held perfectly rigid—no floating. There is no chance of getting ice and salt into the brick compartment while icing.

The high efficiency of the cork-board insulation and construction means a constant low temperature and a minimum ice bill.

Take Advantage Now of Recent Price Reductions

Lower manufacturing costs enable us to give you the same high quality for which our line is noted at a lower price. Write today for prices and all other data.

That Big National Dairy Show

By W. E. SKINNER, Secretary and General Manager

THE article by Mr. W. C. Davis on the National Dairy Show proves its own proposition. Mr. Davis is thinking in terms of the dairy industry as a whole and as a something worthy of the best annual roundup of all of its interests and branches for promotive and comparative purposes that can be built, and his grasp of what its annual exhibit should be is well stated, in fact he hits the nail on the head. And when ye editor editorially comments on the article and asks, "How about it, Col. Skinner?" my reply is, how about it? And perhaps we can both reach some conclusions of value if we just go into a careful analysis of the great National Dairy Show and its progress.

In the first place let us agree that the building of an annual exposition that would adequately present the great American dairy industry to the world, is more than a one-man job. That is evidenced in the fact that until the year of 1922 it was managed by a board of 26 directors, and in 1922 seven more directors were added, and in 1912 a manager was employed whose sole duties were to be the co-ordinating of all the branches of the industry to bring together once a year all that each had to offer as a contribution to progress of the industry.

Now let us check up and see how the child has developed. By 1916 it was proven that the organization as a stock concern could not perform the service expected of it and inasmuch as the parties to its formation and owners of its stock certificates never did look for cash dividends from their investment, it was quickly reorganized as a membership organization founded upon an integrity of purpose open to each and every man, woman, and child with a vision and a desire to see their industry developed to the proportions necessary to secure for it the recognition in the world work it was entitled to. So in 1917 it started on its way again, equipped to satisfy the most critical that it really and truly was in a position to bring the interests into one harmonious family with each year's results to be equally cashed in on by those who were willing to be counted as one of the family. And so in four years it may be said to have, from a child in swaddling clothes, emerged into a fair sized youngster with plenty of opportunity for growth, and this growth must come from just such lines as Mr. Davis suggests. And it is up to he and others of similar vision in the industry to put their shoulder to the wheel and help put her over as big as she can be made. We have the cattlemen; we have the educational and human welfare forces of the state and nation; we have the machinery men and some of the productive side of the business, and we have the national conventions of nearly all of the real big parts of the industry held in the cities where the show is held, but not yet right at and with the show, and here is the work for us to do now: Let us get every branch that has an organized entirety to realize the great big opportunity this annual get-together means to each and every one of us, and to the industry as a whole, and then we will have an annual gathering that will set a pace for all industry and all will realize on it according to the bigness of their vision. We have space to embrace all features and can hold dinners and banquets of all of our people right at the show fully as well as can be provided elsewhere and develop the loyalty to industry spirit in everybody and attain the great success so much desired.

The enlarged plans for the shows of '22 and '23 afford the opportunity perhaps, greater than ever before, for this further melting together of our whole industry, and the committee requested by the machinery exhibitors at a meeting in January of the Dairy Club, and appointed by the directors of the Show Association, with Mr. Davis as chairman, can and will do a lot to bring about what is necessary, and if the men handling the affairs of the organized dairy life have the vision of what it means to be all counted together it will, as the board of directors of the Show Association as now constituted, with every interest represented upon it, fourteen cattlemen to safeguard the interest of the fundamental of our industry, and three milk dealers, two ice cream manufacturers, four educators, seven machinery manufacturers and supply men, one butter man, one condensed milk man and one at large, there can be no further good grounds for any part of the industry not to be functioning as a part of the whole.

Now, how about it, will we go to it now and all be found together building a world's show for 1923 that will be sufficiently inspiring and powerful to give the world a view of co-ordinated dairy industry unequalled in capacity and ability?

Go to it, Mr. Editor, let us have full and frank talks, and when you are through call the volunteers and see who is missing at the next roll call. There is an obligation in our industry resting upon those engaged in it, greater to humanity and equal to commerce of all industries, and big enough men in it to meet the obligations.

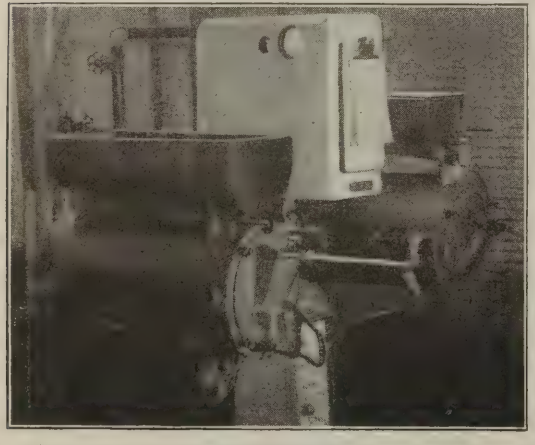
Standardize Your Ice Cream

Mojonnier Vacuum Condensing Unit (5') in plant of Lawrence Ice Cream Co., Chicago. Temperature of milk never exceeds 140° either in hot wells or vacuum pan.



Standardize The Flavor In The Mojonnier Vacuum Condensing Unit

ICE CREAM manufacturers everywhere are fast recognizing the invaluable advantages of the Mojonnier Vacuum Condensing Unit. By displacing the pasteurizer and mixing tank it enables the manufacturer to make his mix from fresh milk direct from the producer and cut the cost of his mix 10c per gallon.

The Mojonnier Vacuum Condensing Unit is a scientifically designed combination of Vacuum Pan, Hot Well, Vacuum Pump, Steam Piping and Traps, steps and all other accessories necessary for a complete Condensing Unit.

Converts waste into profits by converting surplus milk into sweetened condensed milk or other condensed milk products for which there is a ready market.

Compactly built, it takes up little room. Simple and easy to operate.

Overrun Tester in plant of Decatur Ice Cream Co., Decatur, Ala. Mr. Clopton writes it is "one of the most important machines in our plant."

Standardize The "Swell" With The Mojonnier Overrun Tester

WITHOUT definite means of control, the "swell" or overrun in ice cream is subject to wide variation from day to day and from batch to batch.

The Mojonnier Overrun Tester enables you to control your overrun absolutely. You don't have to guess. You can test it while the cream is still in the freezer and control the factors that effect the overrun.

Each per cent of overrun represents just .4c per gallon of mix. Increase your average overrun only 10% and it means a saving of 4c a gallon, or $4,000.00 a year on 100,000 gallons. It is savings such as these that are attracting ice cream manufacturers to the Mojonnier Overrun Tester.

Used by the largest ice cream plants in the country: Hortons, Telling-Belle Vernon Co., Hydrox, Abbotts, etc. Also by progressive ice cream manufacturers operating two or more freezers.

EFFICIENCY PRODUCTS Mojonnier

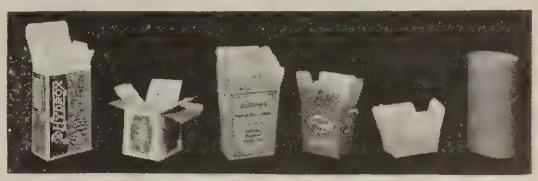
MILK ENGINEERS

BRANCH OFFICES: NEW YORK, 17 E. 42nd St. ATLANTA, 301 Bedford Place.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS

by the MOJONNIER Process



Standardize The Package With The Mojonnier Packaging Machine

THE Mojonnier Ice Cream Packaging Machine is a LABOR SAVER. In one plant it reduced the labor of packaging from twelve to seven operations; reduced number of helpers from seven to three; has reduced hardenings from three to one. Eliminates pouring into molds, dipping, cutting, wrapping and exposure to heat and air after hardening, improving quality and texture of the brick ice cream. It prevents loss of ice cream and does not reduce overrun.

The Mojonnier Packaging Machine is of the measured feed type. Fills all shapes illustrated herewith—quarts to individuals—accurately. No over-weight; no air-pockets; nothing taken for granted. Fills either one, two or three flavors at the rate of twelve hundred bricks per hour.

Mojonnier Ice Cream Packaging machine in operation at the big plant of the Hydrox Co., Chicago, where they package their entire output of one, two and three flavor bricks.

Fills any of the types illustrated above

Mojonnier Tester in plant of Russ Bros., Harrisburg Pa., where they test all the milk products that are used in the mix, and standardize the mix.

Standardize the Butter Fat and Solids With the Mojonnier Milk Tester

TO BE able to buy your raw materials absolutely on the basis of actual butter fat received—to be able to standardize your ice cream mix to within .05% and eliminate all guess work—these are advantages which you desire for your plant.

With the Mojonnier Milk Tester you can standardize your butter fat and total solids in your mix to within a few hundredths of one per cent. Thus you can control all of the ingredients—butter fat, milk solids (not fat), sugar, gelatine, etc. If your ice cream maker gives your laboratory analyst a sample of the complete mix at 8 o'clock, in just forty minutes the operator can tell him the exact butter fat and total solids content in the mix.

The Great Hydrox Company advise that the Mojonnier Milk Tester pays for itself every month in the flush season.

With the Mojonnier Milk Tester, you can test, check and absolutely control the factors entering into your overrun. And that kind of accuracy pays big dividends.

CLEANLINESS IS GOOD DAIRY PRODUCTS INSURANCE.

IS THE CHOCOLATE COVERED ICE CREAM BAR HERE TO STAY?

The Ice Cream Review:

The writer just returned from a western trip, visiting several ice cream factories which were making chocolate coated ice cream bars. In almost every factory visited there was someone who asked this question. "What is your opinion regarding the fate of the chocolate coated ice cream bars?"

This question, at present, seems uppermost in the minds of the ice cream manufacturers. Some are optimistic and have spent or are spending much money for labor saving devices, automatic machinery, etc., in order to more quickly and more economically handle this product. Others are more conservative and are not spending any more money than necessary because they are expecting the demand to be short lived and consider it only a fad. They are making all they can by simple manual methods. They are waiting to see what the summer will bring forth and whether the bar will replace the cone or vice versa.

I was much impressed by the interest and anxiety of the ice cream men concerning the chocolate covered bar. An equal degree of interest was also manifested by chocolate manufacturers and jobbers. Therefore, while lying awake in a Pullman, on my return trip, I naturally began pondering this question.

Here is a product that is only a few months old. From the very beginning its sale has been phenomenal. It has increased the consumption of ice cream and chocolate considerably. Why is this product so popular? Why has the demand fallen off somewhat? Will the demand continue to decrease or will it reach a certain fairly constant level which will only be affected by the seasons?

The initial popularity of the chocolate coated ice cream bar was due to the facts that it was something entirely new, distinctive and well advertised. Curiosity was stimulated by the name. Everybody wanted to know what a chocolate covered ice cream bar is and how it tastes. Naturally when this curiosity was gratified sales were bound to decrease somewhat. However, there are a few other important reasons for the decline in sales.

I have heard a great deal of comment from the "bar" eaters themselves. Namely, the price, when compared to size or to a cone is too high. Some manufacturers have reduced the thickness of the coating or now use a chocolate of lower quality. Some have also reduced the quality of the ice cream. It does not take the public long to notice these changes.

Different manufacturers report a drop from the first week's sales varying from 30 to 60 per cent. It was interesting to note that those who are already making a quality product of larger size, report the least drop or decline in sales. However, the demand is now fairly constant and this, I believe, indicates that the public, in general, likes the chocolate coated ice cream bars.

It is my opinion that the ultimate future of the bar lies entirely within the hands of the manufacturers. Some have already realized this and instead of reducing the price, they have increased its size. Where they originally cut 16 or 18 to the quart, they are now cutting only 12 or 14. This, they claim, has had a noticeable effect on re-establishing their sales, to a certain degree.

There is one point which, I believe, the manufacturer has lost sight of. That is, the fact that chocolate itself has made the ice cream bar possible and its novel combination with ice cream is responsible for this winter's increased consumption of ice cream. Without chocolate there could be no such novelty and since everybody likes chocolate, it behooves the bar makers to use the best obtainable and not be too stingy concerning the thickness of the coating. One manufacturer said "I'm in business to sell ice cream, not chocolate." He didn't stop to think that if it were not for chocolate he couldn't also have said, "This is the busiest winter we've ever had."

The temperature of the coating when applied has much to do with the thickness, uniformity and smoothness of the same. In some plants a recording thermometer is attached to the dipping pans which are heated by either electricity or steam and controlled by a thermostat. An average temperature of about 90 degrees is maintained.

While it is true that an excessively thick coating will flake off it is also true that ice cream melts more quickly when directly exposed to a warm atmosphere. A medium thick coating of good chocolate will not flake off any easier than a thin one and has the advantage of acting as insulation which helps the ice cream to retain its hardness longer after being removed from the ice box. The harder the ice cream, the less flaking or cracking takes place when the bar is eaten.

The ice cream cone is a mussy proposition at any time and causes a loss to the retailer on account of ununiformity of size and shrinkage in dipping.

The chocolate coated ice cream bar entails no shrinkage loss, is uniform in size and if properly coated, is a much cleaner and easier proposition to handle.

When hot weather comes, the public will realize this and then the ice cream bar will be here to stay.

Plant "Housekeeping" Economy

THE expense item of keeping a plant in order is too often subordinated, yet it is an important factor worthy of close consideration. If all the labor time consumed in cleaning up after a day's run were to be tabulated for a year the total would be astonishing. It would reveal an almost unbelievable percentage of cost.

The relation of "housekeeping" economy to the general-system plan or lay-out of the plant is obvious. The difference between the thoughtless placing of machinery, exits, etc., without regard to continuity -- and skillful arrangement, often represents a sum equal to the annual interest on the whole plant investment.

All the way from the preliminary plan to the completed plant there is a sure-footed progression by a co-ordination of

McCormick Architectural and Engineering **Service**

experts highly trained in their respective lines of work. Capacities, areas, volumes, expenditure of labor energy and time, as well as innumerable construction ramifications, are determined with scientific precision, and results are as definite as they are efficient.

Such accurate meshing of these various productive units can not fail to establish an automatic system of "housekeeping" economy.

Before starting on your new plant or remodeling work, it might be to your advantage to communicate with us. You will not be obligating yourself in any way.

Construction Executed by Your Own Contractor Under the Direction of Our Visiting Superintendents

For Greater Service to the Dairy Industry

Chief of Illinois Dairy Division Joins Staff of Frederick C. Mathews Co.

The modern milk plant is delivering a safer, cleaner, sweeter milk than was possible a few years ago. The public appreciates this better product and is quick to criticise anything which it considers wrong in milk. The successful milk man must keep his product above criticism in the matter of pasteurization, cream layer, ropiness, flavors and sediment.

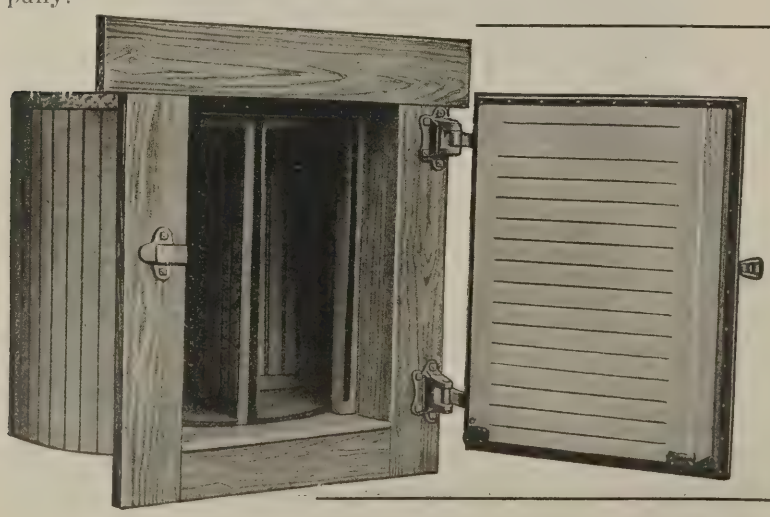
H. A. HARDING.

His need of expert assistance in handling some of these problems is quite similar to the need of a family doctor. Few families can afford to pay for the entire time of a competent physician. Moreover, the emergencies demanding the doctor's skill come at irregular intervals. Accordingly the situation is best met by a number of families joining in the support and sharing in the services of a doctor. In like manner all milk companies need a technical service which is too expensive to be maintained alone by any but the largest companies. The other milk companies can best meet their needs by joining in the support of such a service.

The Frederick C. Mathews Company takes seriously its slogan "Servants to the Dairy Industry." Some months since Mr. Mathews expressed to the Editor his keen appreciation of the need by the industry of a kind of technical service which his company was not then in a position to furnish. It so happened that the Editor had an old friend whom he knew likewise appreciated this same need of the industry. Finding that both men had essentially the same thought the Editor was instrumental in bringing them together and he naturally feels a personal interest in the announcement in this issue that the Frederick C. Mathews Company and Dr. H. A. Harding have joined in the establishment of the Dairy Research Division of the Frederick C. Mathews Company.

Many of the milk dealers have met Dr. Harding at the annual meetings of the International Milk Dealers Association and more know him through his writings. However, few but his intimate friends appreciate how long and how intimate has been his contact with milk problems.

His boyhood was spent in one of the most intensive dairy regions in Wisconsin. At the University of Wisconsin he came under the influence of Professor, now Dean H. L. Russell, who was then just starting the work on tuberculosis of cattle and on pasteurization, both of which have been so important to the dairy industry.



The University conferred on him the degree of Bachelor of Science and later Master of Science. Six months were then spent in Europe with the men who had laid the foundations of our knowledge of germ life. He was particularly impressed by two Danish scientists, Dr. Bang, who developed the Bang Method of handling tuberculosis, and Dr. Storch, who founded the pure culture starter method of cream ripening.

While Research Fellow at Wisconsin under Dr. Russell he had been associated with Drs. Russell and Babcock in the studies which were the beginning of our present commercial practice of ripening cheese in cold storage. On returning from Europe he became Dairy Bateriologist of the New York Agricultural Experiment Station at Geneva, N. Y., and for ten years the larger part of his time was devoted to the study of the process of cheese ripening. A substantial part of what is now known regarding cheese ripening dates from these studies.

Many of these investigations took him into unexplored scientific fields, and when more fundamental training seemed desirable he went after it. Some time was spent at the Massachusetts Institute of Technology in the study of yeasts from dairy products and later a year was spent in study at Cornell University, where he was given the degree of Doctor of Philosophy.

At the New York Agricultural Experiment Station Dr. Harding undertook to find the ways in which bacteria gets into milk and for more than fifteen years he has kept this work going. Many have heard him emphasize the importance of drying milk cans to reduce the germ life entering milk, but few have appreciated that these statements are based upon years of study in this field.

His acquaintance with pasteurization is of even long-

THE STOUT CRATE COMPANY

375 Broadway **Milwaukee, Wis.**

er standing. He was an assistant to Dr. Russell in 1895, at the very beginning of the study of pasteurization in this country. His first Bulletin at the New York Agricultural Experiment Station was on the effect of pasteurization at different temperatures upon the germ life in the milk. His recent publications on the effect of the temperature of pasteurization upon the creaming ability of milk are simply a continuation of the studies and observations which have been going on for more than twenty-five years.

While at Geneva, New York, Dr. Harding served four years on the local board of health. This gave him an opportunity to study city milk from the health angle and to test various methods of improving city milk supplies. He became convinced that the small amount of money available to the health department for milk work could be most wisely spent in inspecting pasteurization plants and in examining the milk as delivered to the consumer.

In 1913 he was called to the University of Illinois as the head of the Department of Dairy Husbandry. The dairy herd at the University of Illinois is one of the largest and best at any agricultural college, and recently it contained the state record cows of their class in each of the four leading dairy breeds. In dairy manufactures the department is equipped to train students in the problems of city milk, ice cream, butter, cheese and condensing, which includes everything except milk powder and the plans for adding this were interrupted by the war. Back of this fine equipment is the largest group of highly trained dairy experts in any dairy department in the country. The dairy department of the University of Illinois is a monument to the administrative ability of Dr. Harding and in developing it he came into contact with all sides of the dairy industry.

RICHMOND CEDAR WORKS

RICHMOND, VA.

Like many of us, the Doctor has been something of a joiner. He has long been a Fellow of the American Association for the Advancement of Science and he was a charter member of the Society of American Bacteriologists and of the American Association of Certified Milk Commissions. He was long ago elected an honorary member of the National Association of Ice Cream Manufacturers. He is also active in the American Dairy Science Association and in the International Dairy Inspectors Association and is a member of the World's Dairy Congress Association. He is also an active member of the American Public Health Association and has recently been made a member of the Royal Institute of Public Health of England.

Having enjoyed this wide range of duties and interests most men would have been satisfied to mark time. However, the Doctor is keen to devote his entire energy to milk problems and his co-operation with Mr. Mathews as chief of the Dairy Research of the Frederick C. Mathews Company will make this possible.

The purpose of this Dairy Research Division is to co-operate with the dairy industry in producing the highest quality dairy products, in lowering costs, and in satisfying their trade. They will do this by furnishing the industry with a technical service of the high quality which is characteristic of the Frederick C. Mathews Co.

FORBURGER DAIRY COMPANY TO MANUFACTURE ICE CREAM.

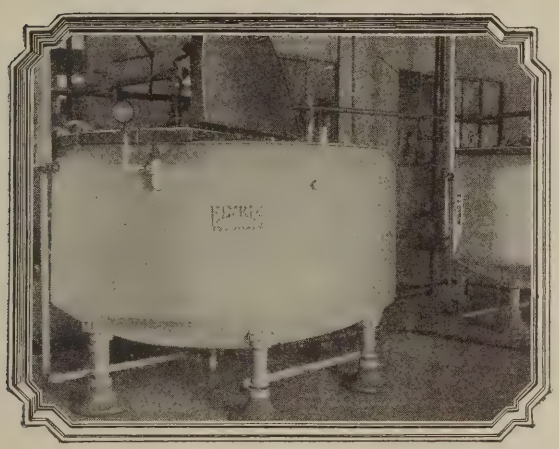
What was formerly the Forburger Dairy of Niles, Mich., has now been incorporated as the Forburger Dairy Company, owing to the growth in the business which calls for an expansion of the facilities for handling their growing trade.

The new company will conduct the dairy company as usual, but will now manufacture ice cream also. The company is now incorporated for $20,000. The officers are C. A. Forburger, president; Clare Rollert, vice president; Carl A. Rollert, treasurer, and L. E. Forburger, secretary. These officers also constitute the board of directors.

The addition to the building is now completed and the floor space is 32x90 feet. A new ten-ton compressor ice making unit, having a four-ton daily ice capacity for use in the ice cream making, has been installed. A 100 gallon viscolizer is also installed, and a chill room having a capacity of 600 gallons of ice cream is in evidence.

ANNOUNCEMENT.

Mojonnier Bros. Co. announce their New York City office, which is now under the charge of Mr. W. E. Larkin, has been moved from 17 E. 42nd Street to 490 Sanford Avenue, Flushing, New York City.



Mr. Larkin is already well known to ice cream manufacturers of the east as he has acted as representative of the Daigger Company for several years and is fully qualified to give any information relative to the Mojonnier Bros. Company's line of scientific dairy apparatus.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

Answering the need for economy with the saving that Elyria brings

General Necessities Company and Elyria Equipment

The General Necessities Company of Detroit use the following Elyria Equipment; three 2500-gallon Aging Tanks; two 1000-gallon Pasteurizers; one 200-gallon Weigh Tank.

THE design and construction of Elyria Glass Enameled Steel Tanks is a vital factor influencing efficiency of operation, long life and dependable service.

Their mechanical perfection is assurance of smooth, continuous operation, steady production and the minimum of time and labor required in the process. Sanitary glass enamel—fused into the steel—is clean and easy to keep clean, and assures purity of the product.

Elyria Equipment, plus Elyria Service in providing plant layouts and recommending operating plans assures large capacity, operating economies and better profits for the user.

ELYRIA GLASS ENAMELED STEEL EQUIPMENT

Factory Hose — Its Abuse

By Mr. S. D. Baldwin, Cincinnati, Ohio.

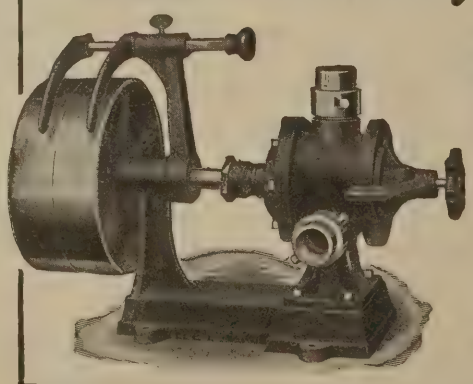
It is probably safest to say, first of all, that the writer of this article makes a business of selling among other items, a well known brand of hose used by creameries and ice cream factories and the suggestions outlined below are drawn from practical experience focused, as might be said, on this one item.

Most of us have a very distinct aversion to the man who continually says "don't". It implies that we know less than he. However, it is necessary to "don't" this article at the very beginning because—

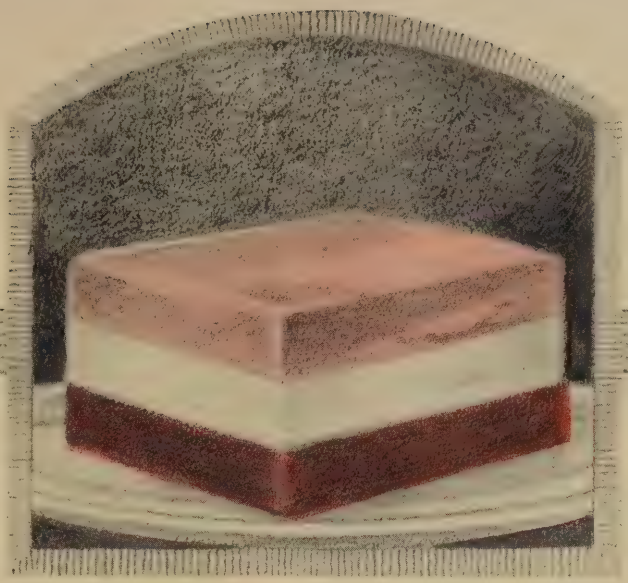
The most common cause of trouble with your creamery hose is the attempt to insert an iron nipple in the end of a hose in place of a regular steam hose coupling. DON'T do it. Usually there is a slight burr on the end of the nipple and this in the process of insertion punctures the inside rubber lining of the hose causing a small jet of steam to escape into the fabric. It is seldom that this runaway steam breaks through at the point of fracture. Usually it follows the line of least resistance winding its way spirally through the various plies until it comes out several feet from the point of original fracture. At times in a well built hose the steam will travel as far as twenty-five feet before it finally breaks through. A regular steam hose coupling carefully inserted will save all this trouble and the cost is certainly not to be compared with the price of several feet of hose. DON'T be penny wise and pound foolish — a good coupling never wears out.

Many creamery men are of the opinion that a good grade of steam hose is sufficient for the work and in some instances it is but steam hose is made to convey steam alone. After being used it is laid aside and allowed to cool gradually. Furthermore, it is used only occasionally. Creamery hose is first expanded to its full extent and then the steam is shut off, as is the case with any steam hose, but before the hose has contracted to its natural dimensions some one uses it for cold water. Thus we have severe expansion at one moment and severe contraction the next — a thing which no self-respecting steam hose is built to do. The two way steam and cold water valve idea is responsible for this difficulty. It is the finest little eliminator of ordinary steam hose ever invented and it is just as easy to get you, Mr. Creameryman, to do away with it as it is to move the Pyramids of Egypt. The only way out of the difficluty has been for the rubber manufacturer to put his chemists to work. If you use ordinary steam hose examine the inside rubber lining. Isn't it about twice its original size?

Creameries usually have cement floors. This plays havoc with the outside of a hose because of the little spears of sand that stand up and which are continually cutting the hose as it is dragged about. Various methods have been employed to counteract this wear, and among them have been the winding of the hose with wire. This is objectionable in that the wire rusts, it makes the hose cumbersome and difficult to handle. Trucks run over it or heavy objects fall on it smashing it out of shape, and a wire wound hose out of shape cannot ever be brought back into its original form. Frequently the wire rusts through causing a break; then the wire spins back from either end and must be cut off leaving the body of the hose without protection. Eliminate wire wrapping. It has not been proven satisfactory.



Another method of protecting the hose has been to wrap or braid it on the outside with cotton or marline. In the first place this covering soon wears through in spots, becoming here and there a nasty snarl of fabric and in the second place the fiber quickly absorbs the fats and ever present cleaning compound solutions holding these rubber-destructive elements constantly in contact with the rubber. Either of these types of covering is less satisfactory than wire winding.



A rubber cover for the above mentioned braided covering is sometimes used, the idea being to keep the fats, etc., away from the fabric. To some extent this protects the hose but the trouble is that it is difficult to thoroughly bond this rubber to the fabric and it has a tendency to loosen. By and by the loose cover catches on something and the whole thing rips off.

A heavy rubber cover, compounded to resist the deteriorating action of the fats and cleaning compounds is easily cleaned and acts much like the tread of a tire. It protects the hose in its dragging over the floor much as the tread of a tire protects the inside fabric in driving on a concrete road. How long do chains last in constant driving, as compared to the rubber tread? Would you think of winding a tire with rope to make it last longer? There you have a fairly apt comparison with wire wrapping and braided cotton or marline jackets.

All of the above deals with the physical construction of a hose adaptable to creamery uses and it is only half the battle. The other half lies in the rubber manufacturer's laboratories and he isn't much in the habit of advertising results that it has perhaps taken ten years to accurately determine.

Testimonial Courtesy

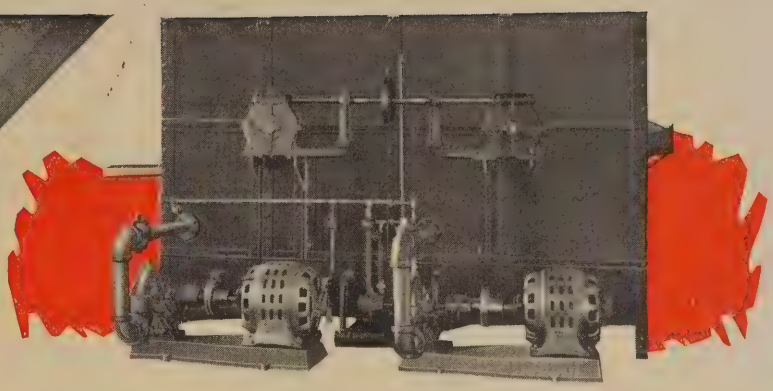
THERE are two classes of testimonial letters . . . . . (1) The SOLICITED, written by a satisfied customer at the request of a manufacturer and to be used by the recipient for advertising purposes. (2) The UNSOLICITED, voluntarily written by a satisfied customer and usually accompanied by a remittance for the item purchased.

We are agreed, that the "Solicited Testimonial" is a sincere expression of satisfaction and that its use for advertising purposes is both proper and correct, and that it serves a useful purpose both for the advertiser and prospective purchasers. The "Solicited Testimonial," judiciously used, has held an important place in modern advertising.

But with the "Unsolicited Testimonial," it would be "a breach of business etiquette" to request permission to publish it, and flagrantly discourteous to reproduce it in an advertisement. Such letters are too personal, too sincere, too near "from the heart" to be made public property. Delighted and happy as the recipient of such letters is, his sense of courtesy directs him in their proper use.

Users of B-F Flavors and Colors have written us many "Unsolicited Testimonials." These cherished letters are in our files now. They are not for "public-print," even though their authors would undoubtedly grant us permission to show them to prospective customers.

Our most significant testimonials of satisfaction are best expressed by our trade's "continued repeat orders."



The Boerner-Fry Company

Manufacturers of High Grade Extracts

Iowa City, Iowa

Rice & Adams Ice Cream

Washes, rinses, sterilizes

The washer is a two compartment power driven machine. In the first compartment the cans receive five washings of solution water at 140 degrees and in the second compartment five washings at 190 degrees, followed by one sterilizing jet of fresh boiling water.

Washed and rinsed with water under pressure of 40 to 50 pounds!

NO WONDER the R & A Ice Cream Can Washer thoroughly loosens the dirt in the dirtiest of ice cream cans. The wash and rinse water, under a pump pressure of from 40 to 50 pounds is directed to every part of the can inside and outside from jets placed at various angles.

Not only are the cans washed and rinsed but they are sterilized with fresh boiling water. When the cans emerge from the machine they are clean, "sweet" and sterile—far superior to cans washed by hand.

Washes all size cans, covers and brick molds

Cans from 2 to 5 gallons, covers and brick moulds can all be washed at the same time.

6 to 10 cans per minute

With the machine running at minimum capacity one man can wash 6 cans per minute. At its maximum capacity two men can wash 10.

Speed up your can washing

Install a R & A Ice Cream Can Washer. The washer will pay for itself with the money it saves on your payroll. It will reduce your costs, help you meet present day competition and give you sterile cans that will keep your ice cream sweet and wholesome.

"UCOPCO Comes Sealed in Red Drums"

Ucopco Pure Food Gelatine

MILLER CREAMERY CO. REORGANIZE.

The ice cream manufacturing business formerly conducted under the name of the Miller Creamery Co., is to be incorporated. The present business is the outgrowth of the personal efforts of F. E. Miller, who began in the ice cream business in a small way about sixteen years ago, and after changing locations twice to meet increased demands he moved to 2941 Broadway in 1912 and erected the main building of the present location. The volume of business has steadily increased and the past year when the make reached half a million gallons, the old quarters were taxed beyond efficient capacity.

For some time past Mr. Miller has recognized the inadequacy of his plant and the need for a stronger business organization. With this thought in mind it was but natural when outside interests came to Oakland to look the situation over with a view to engaging in the ice cream industry, that they found an attentive listener, and current authentic reports tend to show that a strong organization is being developed.

Incorporation proceedings are in progress and the new name of the business will be "The Miller Ice Cream Company." The following well known and experienced men will be on the directorate: W. E. Keller, Los Angeles; F. E. Miller, Oakland; I. J. Trainor, Sacramento; Walter Martin, San Francisco; A. A. Comey, Los Angeles; C. W. Hightower, Jr., Visalia.

The new organization will in no sense attempt to establish a monopoly in the ice cream industry, but will pursue an equitable policy and manufacture a high grade, uniform product, and adopt a constructive program to build up and stabilize the industry in the city and vicinity of Oakland.

Extensive improvements are in progress and new equipment will be added as rapidly as needed. No pains will be spared to make the plant fully modern and complete in every respect.

Incidental to taking in outside capital, Mr. Miller has disposed of his distributing branch in San Francisco to the Acme Ice Cream Co., which started complete operations in November, 1921. Up to the time of disposing of the San Francisco branch, the ice cream sold there was made in Oakland and transported across the bay on ferry boats, and as this method did not prove to be entirely satisfactory, Mr. Miller decided to sell out his branch business.

ORIGIN OF ICE CREAM IS CLAIMED IN STILL A DIFFERENT STORY.

Ice cream was first mentioned, although not perhaps by that name, by Marco Polo, who visited Japan in the thirteenth century. He brought back tales of water and milk ices which were among the delicacies then known to the people of the east.

In the sixteenth century occurred mention of the delectable compound in connection with Catherina de Medici, who introduced frozen fruit juices from Italy to France, while later her son employed a special chef to invent new kinds of ices, the latter installing a shop to sell ice cream to the aristocracy.

There is an account of a wonderful banquet given by Louis XIV. of France, at which was laid before each guest a gilt cup containing apparently an egg colored to resemble those presented at Easter. But to the surprise of the guests, it was found to be "a delicious sweetmeat, cold and compact as marble."—Pittsburgh (Pa.) Press.

PURITY THE ORIGINAL PAPER CAN

—with the famous "locked crimp" top and bottom construction

FOR USE

1. In conjunction with Automatic Ice Cream Packaging Machines produced by Mojonnier Bros. and other manufacturers of creamery equipment.

2. As a sanitary package filled direct from the freezer.

3. As a "carry-home" sales builder by supplying your dealers with them.

Made in capacities from quarter-pint to half-gallon.

The PURITY PAPER VESSELS COMPANY
BALTIMORE, MD.

ICE CREAM MIX READY FOR FREEZING IS ON THE MARKET.

Are Your Percentages of Winter Sales up to Standard?

ARE your winter sales of ice cream up to your expectations? What are your expectations? How much ice cream should you expect to sell in January when you sell twenty thousand gallons in July?

Several prominent ice cream manufacturers have supplied us with data on their sales during different months and seasons of the year. Compare these figures with your own. Send us your own figures and comments for publication.

A manufacturer in a northwestern city with a quarter of a million people, writes:

"We have had a condition out here during the war activities that places us where we have to go back some time and base further increases from then on, the competition is greater and we have to meet with long hauls by trucks where they are giving city service. This has cut into the shipping business a lot, for we have not yet arrived at a point where we can figure it profitable or just. However, we submit the following figures for your statistics:

	1916 Pct.	1917 Pct.	1918 Pct.	1919 Pct.	1920 Pct.	1921 Pct.
Jan	1.1	1.0	4.2	4.2	2.8	4.8
Feb.	2.1	1.4	3.7	4.0	3.8	4.6
Mar.	3.0	1.8	3.3	5.8	5.7	6.2
April	6.8	3.2	6.8	8.8	7.3	8.6
May	11.1	8.2	10.7	12.5	10.5	14.6
June	16.9	12.4	16.5	13.4	13.6	14.2
July	19.4	19.0	16.7	17.4	19.1	17.6
Aug.	21.2	19.8	14.6	14.0	16.9	13.2
Sept	10.0	11.4	12.0	10.8	8.0	6.3
Oct.	3.4	9.0	4.7	3.5	4.9	3.8
Nov.	2.6	7.0	3.2	2.9	4.0	3.1
Dec.	2.4	5.8	3.6	2.7	3.9	3.0
	100	100	100	100	100	100
Total output, gallon	44,028	87,622	129,090	160,849	100,761	81,152

"By this you will note we are considerably behind in 1921, which is to be expected, owing to the business conditions and a very cold season."

* * *

We asked the most progressive ice cream company in a large city located in the central states, for their sales figures. They very generously gave the sales percentages for each month during the past six years, and the average prevailing temperature as well, as reprinted below. Note the gradual increase of winter sales:

	Normal Temp.	1915 Sales Pct.	1915 Ave. Temp.	1916 Sales Pct.	1916 Ave. Temp.	1917 Sales Pct.	1917 Ave. Temp.	1918 Sales Pct.	1918 Ave. Temp.	1919 Sales Pct.	1919 Ave. Temp.	1920 Sales Pct.	1920 Ave. Temp.	Pct. of Grand Total
Jan.	24.6	2.76	23	2.86	30	3.72	24	1.99	13	3.70	31	3.48	17	3.12

Brooklyn, New York

MAKE OLD CANS LOOK LIKE NEW BY RE-TINNING.

From the extreme southwest we learn:

"Replying to your letter in regard to ice cream sales during the year, we wish to submit the following figures:

	Per Cent
January	3.755
February	4.751
March	6.765
April	7.742
May	7.741
June	11.062
July	15.190
August	13.322
September	10.631
October	8.200
November	6.021
December	4.820
Total	100.

and we wonder why so many American people go there to spend the winter. We might infer that the visitors to this winter resort abstain from the great American dessert because it is the season of winter, regardless of the fact that the thermometer may register 90 in the shade.

* * *

The phrase, "It pays to advertise," has been thrown out of the class that carry a question mark behind them and placed with those that are backed up by facts, since a manufacturer with a number of plants throughout the east central states put on an advertising campaign during the winter months, just to see what it would do.

The following table shows the percentage of sales during the winter months:

Per Cent of Year's Total.

	1917-18 Per Cent	1918-19 Per Cent	1919-20 Per Cent	1920-21 Per Cent
October	4	4	8	9
November	2	2	5	6
December	2	2	3	5
January	1	2	3	5
February	2	2	3	5
March	4	4	5	7
Total	15	16	27	37

Does it pay to advertise ice cream? Can the proportion of winter sales be increased? The answer is in the table above. This manufacturer says:

"The increased sales in January and February, 1921, were due principally to a special winter advertising campaign we carried on for experimental purposes.

"We have selected one of our plants this year and will spend the advertising appropriation during the lean winter months, omitting summer advertising, and we hope to have something of interest to report this time next year."

* * *

From a north central city came the following:

"We are pleased to submit the following figures relative to the proportion of ice cream sales during the winter months compared to that of the summer months:

1914	15 per cent
1915	25 per cent
1916	19 per cent
1917	25 per cent
1918	17 per cent
1919	31 per cent
1920	31 per cent

"You will notice the consumption of ice cream for the past two years has increased considerable and we are satisfied that it will continue to increase."

* * *

A Philadelphian boasts:

"In reply to your inquiry of the 3rd instant, we desire to advise you that our winter sales are approximately 30 per cent.

"We believe that the winter consumption of ice cream in Philadelphia is considerably larger than any other community in the country. This is chiefly due to the fact that the people of our city have been educated to look upon ice cream as a food rather than a luxury. Advertising has played a conspicuous part in this educational work. While, at the present time, we are unable to quote exact figures, we are quite certain that the per capita consumption in Philadelphia is very much above that of any other city."

* * *

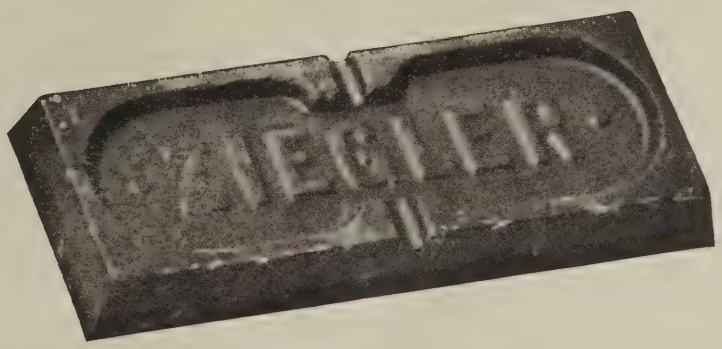
The three reports below are from the south:

"Replying to your letter of December 3rd, regarding the percentage of our winter sales as compared against that of our summer, might say that they will run about 33⅓ per cent. In other words, we sell about three times as much ice cream during the summer months as we do during the winter months."

* * *

"Our fiscal year is from October 1st to September 30th, and all our figures are on such years.

"We have taken the months November, December, January, February and March to be winter months. March is really an early spring month, but very often is as cold and bad as any month that we have. We therefore never figure much on March as an ice cream month.



"Figuring on that basis, our winter gallonage for the year, October 1, 1916, to September 30, 1917, was 15.9 per cent of our total gallonage. For 1917-1918, was 14.5 per cent. For 1918-1919, was 18.3 per cent. For 1919-1920, was 16.7 per cent, and for the last year, 1920-1921, was 24 per cent.

"With the weather the same during the entire period we feel sure that it would have shown a steady increase

A REPORT FROM THE MISSISSIPPI VALLEY.

each year. We are working harder each year to increase our winter gallonage and we believe that we will be able to show a better percentage than 24 per cent for this year."

* * *

"Considering October, November, December, January, February and March as winter months and the rest as summer, we can submit the following information, based on gallons actually delivered. In 1918 we sold 147 per cent more in summer than in winter; in 1919, 126 per cent more; 1920, 196 per cent more. For the first three months of 1921 we sold 36 per cent more than the same corresponding period for 1920, but show a decrease of 27 per cent for the six summer months of 1921, as compared with the same period in 1920.

"We could easily consider October a summer month, for the sales compare favorably with other summer months, however, in submitting these figures we have considered October as a winter month as we imagine most plants do likewise."

* * *

Sales during 1921 in Philadelphia:

Month	Ratio
January	4.0 per cent
February	3.8 per cent
March	6.6 per cent
April	7.9 per cent
May	10.1 per cent
June	14.4 per cent
July	16.2 per cent
August	11.9 per cent
September	11.6 per cent
October	5.8 per cent
November	4.3 per cent
December	3.4 per cent
	100.0

Ice cream manufacturers everywhere are requested to send us their reports for publication, name withheld if desired. If your winter sales are anywhere near, or over 37 per cent of your year's total, tell us how you did it.

LOWER PRICES.

The fifth reduction in the price of Blackmer pumps and units has just been made, according to an announcement by the Blackmer Rotary Pump Co., of Petoskey, Mich. The factory is now operating six days per week.

IN MEMORIAM.

It is with sincerest regret that I am obliged to chronicle the death of Albert J. Rice with whom I was associated in business over twenty-five years.

Mr. Rice was born in Sodus, N. Y., in May, 1847, and died there January, 22nd, 1922.

A. J. RICE.

He was educated in Sodus Academy and Cornell University. His brilliant mentality and fertile brain seemed to have a natural trend toward mathematics and invention. Many useful articles were invented and patented by him, some of which worthy of mention are: The Rice Fruit Evaporator and the Rice Apple Parer.

In later years when he became interested in the manufacture of Dairy Machinery for the economical handling of market milk, he invented the In-The-Bottle-Pasteurizer, but his greatest achievement was the invention of the Pressure Bottle Washer.

This Pressure Bottle Washer completely revolutionized the method of handling bottled market milk, and made it possible to wash and sterilize milk bottles in large quantities with great speed. It is not unusual to handle two hundred thousand bottles daily at one plant. Thousands of these machines are in use in this and other countries, which are a lasting monument to his memory.

RICE & ADAMS CORPORATION,
By C. S. Adams, President.

(Continued from February Issue)

Mr. Roszell: Mr. President, ladies and gentlemen, this question of proper depreciation is one that is a pretty big mouthful. The word depreciation is a big mouthful. It rolls out of your mouth nicely. We are inclined to talk about it and not know a lot about it. It seems to me it is like Kinky Rastus down in Oklahoma. He rode in on a prosperous oil wave and made himself a lot of dough in a hurry. Now Rastus had an obsession for a wrist watch and he went out and got one for $500, the finest he could buy. Rastus put this wrist watch on his arm and he was swaggering up the main street with it just as proud as he could be, and the watch shining like the sun. He met Moze on the street. Moze looked at the wrist watch and he said, "Ras, what time am she?" Rastus immediately saw his prestige slipping, because he had no more idea how to tell time than a rabbit, but he thought he'd try to bluff it through, and so he threw his wrist out toward Moze and said, "Dere she am!" Moze came right back with, "I'll say she am." Now that is the situation a lot of times; we are inclined a lot of us too many times to talk about depreciation and not dig into actually what the stuff means to us.

Proper Depreciation for Ice Cream Equipment.

This subject covers one of the most vital phases in the ice cream business, and yet one which in a great many cases is not given the thought and consideration commesurate with its relative importance to new profits.

The average ice cream manufacturer is extremely careful in figuring his cost of materials, labor and what we might term outstanding cost items, but too often, almost entirely overlooks the hidden items of expense. The most insidious of these items, and one that works twenty-four hours a day—day in and day out—regardless of whether business is good or bad, is DEPRECIATION.

The principles of DEPRECIATION and properly commuting it and setting up a reserve depreciation account, is for but one purpose—no matter whether the business is that of manufacturing railroad locomotives or ice cream. It is for the purpose of securing a correct wear and tear cost on operating machinery and equipment so that when a certain unit of machinery or equipprovision made to buy the new unit from a fund that has accumulated for that purpose and not have to take money out of the profit account to pay the bill.

DEPRECIATION, as applied to the ice cream business is extremely deceptive, because the peculiar nature of the business and the materials used, and the necessary unusual construction of the type of machinery used, all combine to create a depreciation condition not ordinary to any other business.

For a moment, let us just consider the equipment of an ice cream manufacturer, that is subject to the ravages of salt brine and calcium. If this equipment were continually in use the effect of these chemicals would not be so disasterous as it is when the equipment is largely idle during the dull season. This one point is merely mentioned as one of the out of the ordinary conditions peculiar to the ice cream business.

To get down to brass tacks on this depreciation of equipment in an ice cream plant, let us assume that we are discussing the average one hundred thousand gallon ice cream business in which the investment in equipment is somewhat as follows:

Building	$35,000.00
Refrigerating and ice machinery	7,500.00
Ice cream machinery	5,000.00
Tubs, cans and cabinets	5,000.00
Delivery equipment	5,000.00

As a total of these figures, we have depreciable items of $57,500.00.

The question that is often asked is what is a fair depreciation on ice cream equipment.

This question is answered in many ways and is a debatbale one, and has been determined by many manufacturers by keeping close tab on actual experience. Any manufacturer who has watched depreciation properly for a period of years can correctly answer the question.

The figures here submitted are taken from a concern who have a depreciation experience record covering a term of ten years, and the actual replacements on items of equipment have proven these estimates to be correct within a very small percentage. The table followed in commuting depreciation by this concern is as follows:

	Per cent
Buildings	7
Trucks and delivery equipment	33⅓
Ice cream machinery	12½
Ice cream tubs, cans and cabinets	20
Refrigerating and ice machinery	15

This rate of refrigerating and ice machinery figures 12½ per cent on the actual machinery, piping, etc., and 25 per cent on ice cans.

Taking this basis of figuring depreciation, let us

Possibly it may occur to some of you that the figures of 7 per cent on buildings is unreasonably high, but you must bear in mind that the construction of this building is for one specific purpose—the manufacture of ice cream. Here we have another situation quite peculiar to the ice cream business, in that while this building might not be entirely ready for replacement at the end of approximately 15 years, yet, what would it bring for any other purpose? Any of you who have attempted to cash in buildings constructed especially for the ice cream business will realize that 7 per cent per annum depreciation will not absorb the loss you were obliged to accept then disposing of the building for any other purpose. An ice cream building is not like a building erected for light or dry factory purposes or for store purposes, and there is, therefore, a big item of depreciation that must be considered when converting an ice cream building to any other purpose.

Now that we are willing to assume that these figures are substantially correct,, let us see where this generally overlooked item of expense gets us on our cost books.

We had a total annual depreciation of $6,865.00 which figured against our annual production of 100,000 —gives us a cost of nearly 7 cents per gallon.

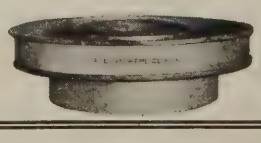
Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Icless Express Container.

What Would it Save for You?



Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover { Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical way in which they help to develop business.

Decy IceLess Express Container Co., Inc.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

TIMES BUILDING
Room 1001
NEW YORK, N. Y.

With this assumed situation which may vary when compared with actual situations in the case of you gentlemen, and making suitable allowances to fit individual cases, you cannot but see that this item of depreciation is one of tremendous importance in your cost figures. Comparatively speaking—it means more than the cost of your sugar—nearly as much as your entire payroll. It is with you 365 days a year and with the present price lowering tendency coupled with lower gallonage and therefore increased costs, it will in 1922 amount to more than the average profit in the ice cream business; and unless it is taken into consideration, may mean a difference between a profitable and an unprofitable year's operation.

By all means, if you are not already doing so, complete immediately a careful classified inventory of your depreciable equipment and charge off each month into a reserve account an amount adequate to cover the day in and day out shrinkage in your equipment values.

Just remember that it is an extremely comfortable feeling when you need new ice cans and new freezer, new tubs, cans, cabinets or a new truck, to realize that the necessary outlay for this new equipment has been covered in your cost figures and that the purchase is not going to disturb your profit account.

Now it seems to me in the discussion we were having about the small ice machine, that that hits this thing right here. If you are going to load your trucks with tons of ice and salt, the brine runs down all over them; you do the same thing with your cans; if you can find a dry storage in the cabinet for your cans the saving in depreciation on the cans and on the drivers jamming the cabinet to pieces will cut the depreciation on the cabinet down to half. That would be a saving that would almost equal your saving on the ice and the salt.

Now those figures are just gotten together for the purpose of comparison.

Mr. Shedd: Mr. Roszell, on the matter of buildings I had occasion recently to fight that out a little bit with the income tax,—I don't know what you call him, but he came and looked over our books for the last four or five years and sort of told us where we cheated the government a little bit.

He wouldn't allow us that heavy depreciation on the buildings. Our buildings are constructed of concrete foundations and good brick walls, but the inside is what they call mill work, and we wanted to allow 7½ per cent depreciation on the building, and he wouldn't allow us but 3 per cent.

Mr. Roszell: He may get us, but I am going to suggest that you move down to Peoria. So far we have been getting away with 7 per cent depreciation. We have been investigated several times. It has been necessary to take the inspectors down and show them how the salt water is eating the building floors out and eating the I-beams out, but whether the government allows that depreciation or not on an ice cream plant, if they don't allow it, it is due to the fact that they don't understand the situation. Take any ice cream plant and go to convert it into anything else, and the difference in the cost of the cost of that diversion would more than run it up to the 7 per cent figure. Where the fellow goes to work and makes an investment in an ice cream plant he has an ice cream plant and nothing else; he cannot change it over to anything else without a large cost. It is something that we should consider, I think, when we are thinking of refrigeration and depreciation.

Mr. Cunningham: I never looked at the ice cream plant from just that particular viewpoint before, Mr. Roszell, but it is a good point, the changing of the plant, that is a depreciation there all right; the ice cream plant is a specific building, built for that pur-

pose, I know mine is and I want to thank Mr. Roszell at the same time for the warning that he sounded to the manufacturers sitting here to be careful about the depreciation account.

Mrs. Babcock: The druggists that are going in in Minneapolis are going to have no depreciation, and they are going to refund the druggists 50 cents a gallon next fall.

Chairman Courtright: They are forming a company of their own?

Mrs. Babcock: To manufacture ice cream, yes. They are going to sell at less than a dollar a gallon and refund the druggists 50 cents.

Chairman Courtright: Seems to me that an ice cream convention with Col. Munn, the president of the National Dairy Council, is not complete unless we have a few words from him. I see he is with us and I would like to hear from Col. Munn, president of the National Dairy Council. (Applause).

Col. Munn: Mr. Chairman I am mighty glad to be in this convention and stand side by side with the ice cream men. The National Dairy Council is glad to do it. We are glad to talk about the product you are producing as a food, and we are going to continue to do it.

I see a great evolution going on in this industry; I see it going on, because men are getting this industry; I see it going on, because men are getting so they understand better the business you are engaged in; you are understanding better what it means, and you are building faster than I would have supposed it possible to build, considering the short time you had to build this great branch of the dairy industry. We cannot do these things in a minute; it takes time for evolution of the right kind. When you realize that this industry has practically grown to the point it occupies today in the last ten years you can realize what I mean by that, because ten years ago the industry was nothing compared to what it is today. I can remember when it was a race to see whether I could get the ice cream in my stomach before it melted or I had to drink it as a liquid. You are putting out a product today that has more food value in it, because it is made better, and enables a man to eat it in company.

There are two or three things that I think you should be doing that you are not doing. Gentlemen, you have to begin to talk your product as a food, because that is what it is, a vital, human food, a basic food, and you have to begin to talk it as such.

I listened to this gentleman, and I supposed he was for the soda fountain men,—I assume there are some in the room. I thought to myself, what an opportunity there is for the dispenser of this in the drug store, the soda fountain or in the restaurant to build this industry. Why, you go by and you see a beautiful painted maiden, either drawing up visions of a harem or heaven, whichever way a man's mind happens to run, labeled Cocoa Cola. Why don't you talk in the drug stores about ice cream as a food? Why don't you have something there to say "If you are tired, ice cream will restore your vigor." "If your vitality is reduced, ice cream will restore your vigor." You have the facts for it, plenty of them. I used an illustration, I think, in Minneapolis about how the ice cream industry stands today, and I want to call it to your attention again—I assume some of you weren't there. I had the government figures a short time ago on the amount of ice cream made in 1920, —260,000,000. They are too low. Of course there was a good deal of ice cream made that the government never heard about. We will assume it is 300,000,000 gallons, which is somewhat nearer right, and I presume still too low. Ice cream, machine run, weighs about five pounds to the gallon; batch run weighs nearer six pounds to the gallon. Taking it midway on that, and assuming there were 300,000,000 gallons of ice cream manufactured and sold in 1920, reducing it back to pounds and quarts, it means there were about eleven quarts of ice cream per capita consumed in 1920. Now one quart of ice cream will make six raifly good sized dishes of ice cream, just medium sized dishes, or, in other words, we ate in 1920 sixty-six dishes per capita of ice cream, one dish of ice cream a day per capita for sixty-six days out of three hundred sixty-five. We should have been eating three, four or five times that much for our own good.

Does that give you any idea of what the possibilities of your business are? Can't you see what an opportunity there is to build if you will get the mother and the father and the guardian of the children thinking about ice cream as a food? You don't have to appeal to the child on the ground of a delicacy any more. Find me a child who doesn't know that ice cream tastes good and I will say you have discovered almost a miracle. You don't have to talk about that side of it. But get the person in charge of that child to understand that every time he gives that child a dish of ice cream he is building that child up. Talk about this as a food. Don't talk about it as a delicacy, but as a food. We all know it is delicious, but few of us know it is a food.

Now I want to say this to you. I know that most men who are engaged in the ice cream industry are trying to put out as good a product as they know how. I won't say it is impossible to improve on this; we know improvements can be made, but I am not one who believes that the ice cream industry, as such, or those who are engaged in it, are dishonest. They are low in morality—I don't believe that. I know that the contrary is true, and I am here to tell you that. But I do want

AUDITS SYSTEMS APPRAISALS INCOME TAX SERVICE

523-24 Lemke Bldg. Indianapolis, Indiana

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS

The BANTAM—a C-T truck for light delivery and parcel or messenger service. Less expensive to operate than a motorcycle, fast, easy to operate, reliable and long-lived. The smallest of the C-T line which includes trucks of all capacities up to 5-ton, and 10- and 15-ton tractors.

Trucks, however good, require service

THESE two garages are typical of a number of others placed at central points to furnish service to C-T users, promptly and economically.

If a part breaks, there is another at a nearby C-T service station, and a man to put it in if you want him.

The user does not have to go to other manufacturers for anything. C-T trucks are made throughout in the C-T factory. The C-T service station carries a complete stock.

C-T users do not need service often. Note the simplicity of the BANTAM—steering gear, controller on the steering column, and two compact motor wheel units make up the entire mechanism of the truck.

There are very few parts to wear out or break. But when parts are needed, any of these well-equipped service garages can supply and install them without delay.

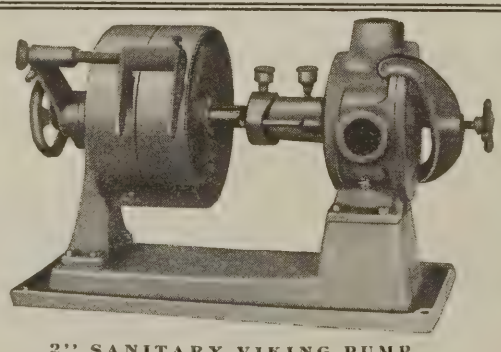
to see you men put this where it belongs in the great category of human food. I want to see you men build your business, because in doing so you are helping yourselves, but above that you are helping humanity, you are helping build healthy boys and girls, and therefore helping to build a more stable and secure nation of tomorrow. (Applause).

Mr. Knobbe: Mr. Chairman and Gentlemen, I not only didn't know I was on the program, but I refused to serve on the program, but they put me on anyway.

I have been listening very attentively this afternoon, and we have had a very nice program, very interesting. I did begin to think there that the ice cream man was just about right and reached perfection, gave service, and that was all our trouble, just giving service, to be courteous, be right there on the job every minute. It is a very fine paper, but I want to say that in the city of Chicago we have pretty nearly overdid the service. We are giving them such service that we are there at their door before they get their breakfast, and we are giving them some service with the refrigeration and the soda fountains, so much so that when you come in now they look at you and say, "Well, what are you going to do for us? What is your proposition? How much are you going to pay on the soda fountain?" And I hope that is service. (Laughter.) It is running this town all the way from two hundred to a thousand dollars, and I guess we have pretty much been in the same condition as other lines of industry, we thought we were going to escape the slump, but we didn't, and we have woke up now, where we have about four trucks where one would give mighty good service. That is the condition this town is in, and I think the ice cream man of the city of Chicago that I am speaking about now—because that is very dear to me—I don't care much about Peoria, I think they can handle Peoria pretty well—but we have a great problem on our hands. They tell us "boom the product." That is all right, but she was boomed pretty heavy, and there is a happy condition in business whereby you must also have a little demand. You cannot create it all, it is impossible to do that.

Now when a class of men think that they can turn around and take an article, I don't care if it is an article as good as ice cream, and crowd it and over-supply the demand, they are mistaken, and the city of Chicago today has got more buildings and more freezers and more trucks than the industry warrants, and you have to do a lot of hard thinking over it.



There has been money thrown into the ice cream business promiscuously. I don't know whether it was the fault of the fellows originally in the business, but I will take it we were going through a war period where there were pretty good margins made in all lines of industry, and the man making money in one industry would say "What is good to get into?" and he would kick over into this, and the men up here know very well that the demand for ice cream in Chicago is pretty well taken care of. We went fine up until the first day of August, and then the weather changed a trifle and I lay it a good deal to the people becoming more cautious about spending their money, their earning power dropped, and they can get along without ice cream; while it is a wonderful food, we will admit that, but they can get along without it, and they are beginning to economize, and the sales have dropped, and I don't believe that a little advertising is going to make all the freezers and all the trucks busy.

And you have something to think about. You have to watch your step. Yesterday I met a gentleman from Iowa. He dropped in town here and he came down to see me, and he said, "What is the trouble with the ice cream industry?" "Why," I said, "there isn't anything the matter just now, it is very quiet." He said, "I just came down Randolph Street and counted six big five ton auto trucks on one street, ice cream trucks, on Randolph Street, right here in the loop." Now, gentlemen, I hope that is service. That is the condition we are up against.

As far as refrigeration and those things are concerned, I think they are coming along very nicely, and I hope these men that work in the soda fountain game will build a better box and I hope the little refrigeration machine will get down where we can use it, and without a doubt it will, and we will accept it very readily, because I believe it is a good way of handling the goods, it is a saving. But there is some thing the matter with the overhead. When overhead runs more than the material in the pot there is something the matter and that is what it is doing in this city today. That is the problem, the overhead is running greater than the material. Think it over. That is the condition we are facing. Sugar, cream, milk and everything going in there costs so much; then figure your total overhead, with your large buildings and large equipment and the method of making and the method of delivering—that is what is staggering the ice cream man.

Now what is right up in front of them all is, "I haven't gallons enough for my plant; I haven't gallons enough for my institution." That is the one problem facing the ice cream man. Shall he go out and crowd? Try to fill those trucks? What are you going to do with the other fellow's trucks? What are you going to do with his plant? Today the ice cream man is in a very nervous state. He is running from one city to another. It has been amusing the last four weeks to see them chase up and down this country—"There is something the matter." That is what is crowding, too much

Manning Can Washer

More thorough, more dependable and more economical than hand washing—gives you greater friction that cuts loose every particle of film and grease.

Turns a mean, sloppy job into a pleasant task, keeps workmen contented, and makes it easier to hire more good men.

The brushes reach every curve and corner of the cans, inside and out. Brushes can be removed separately as they become worn—no necessity for buying a complete set of brushes when one wears out.

Creasey Ice Crusher

This is the favorite "Old Ironsides" which has been grinding through tons of ice year after year for a host of satisfied users.

We carry Creasey Crushers in carload lots, in Chicago—a saving to you of time and freight.

This is a sturdy machine, built over-size throughout to stand up under the hardest service. Every ice creamplant needs it.

BARBER

AS the ice cream season draws near you will find that you must have certain equipment or supplies—in a hurry. Remember that we carry in stock everything from parchment to heavy duty freezers, ready for immediate shipment—in line with our policy to serve the trade well at all times, and *when they need it most.* You can save freight on most items by buying in Chicago—from Barber.

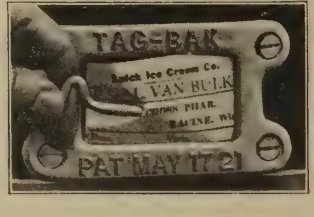
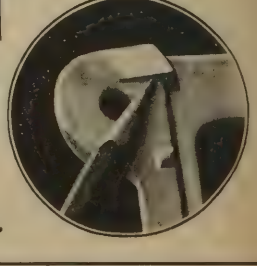
equipment for the demand, and I am going to tell you gentlemen I don't believe it is a good thing to crowd any industry too hard. There comes a breaking point where the supply is overdone, the demand isn't there. We went through it in the milk business and we have reached it in the condensed milk business, if you please. There have been a great many condensing plants had to shut down in the last week because they couldn't move condensed milk without a loss. They say, "Who is going to close?" They are all alike. Every man has a right and a chance to do business. I met some condensing men about a week ago and they said, "You haven't any business to make evaporated milk,"—because I was in the ice cream industry—and I was in the milk business a long while before he was. I finally informed him that I understood he was connected with the packers, and I believed the packers would better stick to the meat business. That is the condition that we have gotten into and the ice cream man has reached that point also. We are just sitting here studying the proposition—which way will it go? Some fellow will lead out and he says, "I am going to crowd." Then we will call it the survival of the fittest. You cannot rush into an industry the way they have in this industry, because the population has sagged back on their buying, and you couldn't blame them—they need the money, they are not going to buy something that they don't need; they are not going to give the children a half dollar for a brick of ice cream because we have put five thousand dollar motor trucks to take around that ice cream, and because we have built buildings for two or three hundred thousand dollars that we know now could have been built a little smaller. but the game looked so good they rushed at it, and what one man did the other had to do, and then the other fellow came along and met him and said, "I am right up with you again," and then the other fellow went out and raised the ante again, and so it went. Now they are all sitting and looking at each other and wondering, and I don't believe there is a manufacturer in this town that is going to lay down and say "All right, there is hardly enough for all of us, you take it," and walk away.

Talk about nervousness. Why even the idea of the Eskimo Pie got them all panicky. (Laughter.) Why you have been throwing a fit for ten days. (Laughter.) Ice cream put up in a little chocolate covering, a new method of marketing ice cream. The ice cream man says, "It is a confection, I don't know as I want to take hold of it," "but," he says, "I must, because my competitor will." He wasn't particularly interested that his competitor might make some money out of the candy, but he was afraid he would go out and take his customers. There you are. When they began to abandon the horse-drawn vehicles and put on a beautiful motor truck, the other manufacturer said, "I don't believe I can deliver as cheap with a motor truck as I can with a horse, but say, I have to do it to keep pace, my customers might think I was a back number if I didn't."



Now those are the things that are the most interesting to the ice cream men of this city. I know that because I meet them occasionally and I hear their talk, and they are not worrying very much just how we are going to put it in a cabinet.

That little ice machine was a very interesting thing to us. That started a panic here about eight weeks ago. They came running down to me and said, "You will have to go up and look at this thing, this is a winner, and you will better get in on it. I said, "All right, there is another fifty thousand dollars." But you have to buy it because the other fellow will get it and he will take your customer. So I went along and examined it. I said, "It looks good." We talked with the gentlemen about the cost of it, and about the maintenance of it, and then the vital thing came out, the monopoly part of it—"can we get it? Can we get the patents and shut the other fellow out?" One fellow said to me, "Let's get that, and look at the stops we can get." He wasn't particularly interested in that little machine except to get the stops. And when I discovered up in Milwaukee there were five or six firms building them I said "Good night, I am not worrying so much now, except where they tie it up and get the advantage." We will all accept the small refrigeration when it comes, just as we have other methods of handling ice cream, and it has changed considerably in the last twenty years.



Now I don't care to say very much this afternoon. I am pretty well interested in the conditions, and there is a great deal of thinking to be done, there is a great problem ahead of us. In the evaporated milk game we are up against the same proposition. The milk business is the same, and the dairyman is in the same situation. They say "Advertise, and boom the product." That is all very good, that is an outlet, but you cannot spend all your money advertising, either. I happen to be a farmer myself, and I am going to tell you that when they come to tell us—a lot of men from Dakota came down into Wisconsin and bought some of our Holsteins, and "this milk business is going to be good, boys, they are buying you out in Dakota"—and I want to inform you that the Dakota milk can kill us too. The cows are still in the country and they cannot drink all the milk the way we are equipped now. We are simply suffering from the awful prosperity we had during the war. We had to supply the world and part of the world has shut us off now. It is a condition that we must meet, and it is not anything very alarming, if men will only cooperate. It is a condition that the Wise men knew was

Why TAG-BAKS Bring Your Tubs Back

is best explained by the special patented construction of the TAG-BAK itself and by those who have used them.

The projection on the back is the little device that lets the tag slip in easily and prevents the tag from coming out again. Only a sharp pointed tool; deliberately inserted in the tag can remove it from the TAG-BAK System.

coming. It is a condition that we expected, and it is a condition that sensible people take gracefully, and if there is one class of people in the United States that you have to take your hat off to to take a bumping and a good bumping and smile, it is the farmers, the men that are milking the cows today. I associate with them right along, and I know what condition they are in, and they take it very gracefully, and I am going to show you why —because they are all in the same boat. But I am going to tell you that if a few farmers could lead out and market their products and get the people to buy their milk, there wouldn't be so much harmony among the farmers.

So I think the ice cream industry as a whole will have to co-operate a little bit, and I would advise not too much pushing or too much crowding, and if each one of you will carry your part of the burden you are not going to suffer much. I will say that we have got a third more equipment than we should have. Instead of trying to run one hundred per cent on your equipment, you let that other fellow run somewhere around seventy per cent, and you wait your time, and you do a little judicious advertising in the meantime and see if you cannot work back on to the mat. I figure that it will take a couple of years without any more fresh equipment to let the men live that are here.

Those are the conditions of the ice cream business as I see it. In the evaporated milk business there are men big enough in that game when they got their warehouses full and couldn't sell it to stop making evaporated milk until there would be an opening. Now you will have a certain crowd all over that says "This is a case where I can still get a little." There is always a certain crowd that will put their feet in the trough. But if you ride through next season with a low purchasing power of the people and go to crowding, I think you will crowd down pretty low.

Now some figured out—and it is natural—if I could cut down a little and go out and get more in my line—but you will find that the other man is there too, so that here is the cry that goes up, "You are too high with your prices, your goods are costing too much." Maybe that is so—that is something for us to think about. If we didn't have so much equipment and overhead—perhaps we are all wrong, perhaps we should take our medicine and put that article right down to bed rock and ride through a year without a cent profit and let the people get this at a reasonable price. Those are the big problems we have to figure over. Maybe we were a little too prosperous in the war. Everything we get in this world we generally pay for, and she just goes in cycles. They tell about the big boom that is on now. In 1892 in the city of Chicago the boom washeavier than it is now. There was real estate sold in Chicago for two hundred dollars a front foot that never reached it again. Men drew seven or eight dollars a day building the world's fair, and the same men went back to a dollar and a half and two dollars and three dollars a day. That will have to come again. We were talking it over today in regard to delivery of motor trucks. When you get oats down to thirty cents, corn down and hay down, horses cheap, then you are facing the problem with your big motor truck, the heavy repairs, and you have to figure out how to do your own repairing; you certainly cannot run the big trucks in the shop and pay the bills we have been paying on the margins.

Now I don't want to be a pessimist at all, because I am not, but I am simply pointing out the things as facts as we see them, and I think it is a good thing for us to look squarely in the face. Personally, I feel a little more comfortable today than I did two years ago. It was a reckless way to do business. I couldn't see much to it.

You didn't know where you were. Why, as I told a friend of mine the other day, I said, "We were millionaires on paper, but we had the satisfaction of being rich for a little while anyway. Now we are going back to work and we will feel better.

Gentlemen, I thank you.

Chairman Courtright: Thank you, Mr. Knobbe. I would like to get both sides of it, but I am afraid Mr. Knobbe has been reading about the disarmament proceedings in Washington and wants to take a ten-year vacation.

Mr. Knobbe: I don't believe in disarmament, and I think that is all it will ever amount to, is simply a little saving, and you will never stop war until you play fair with the other fellow. You will have to play fair with the other fellow before you will ever stop war.

Secretary Loewenstein: The Barber people have requested that an announcement be made that the Rogers brick wrapping machine is on display at the Standard Ice Cream Co. plant, 4501 W. Lake St. Any manufacturers wishing to see it in operation can do so tomorrow morning at 8:30 and still get down here in time for the opening of the meeting at ten o'clock.

The Mojonnier machine is in operation at the Lawrence Ice Cream Co. plant, 937 W. 21st St.

Upon motion, duly seconded and carried, adjournment is taken at 4:55 P. M.

* * *

Wednesday morning session of the Illinois Association of Ice Cream Manufacturers is called to order at 10:45 A. M., President G. R. Courtright presiding.

Chairman Courtright: The first on the program this morning is an address by Mr. Gassmann of the Gassmann Ice Cream Co., Olney, Ill., on the subject, "Viscolizing the Ice Cream Mix."

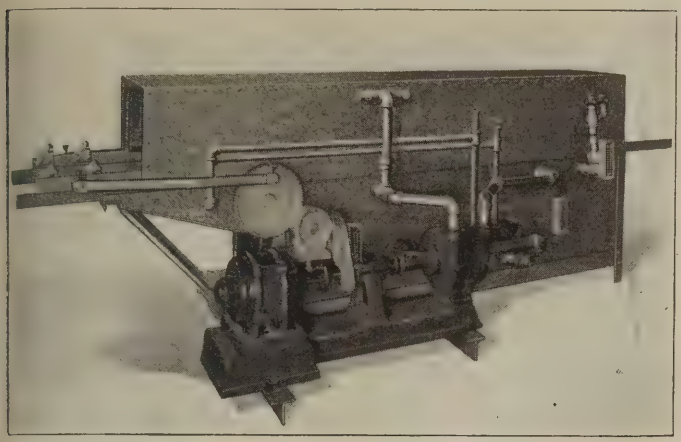
VISCOLIZING THE ICE CREAM MIX.

Address of Z. G. Gassmann, Olney, Ill., Before Illinois Association of Ice Cream Manufacturers, Dec. 7, 1921.

Viscolizing the ice cream mix is a process by which we bring about important and desirable physical changes in it, without affecting in any way its chemical composition. I shall dwell only briefly on the physical changes which take place, inasmuch as I believe we are most interested, not in **what** they are, but **how** we can go about securing them.

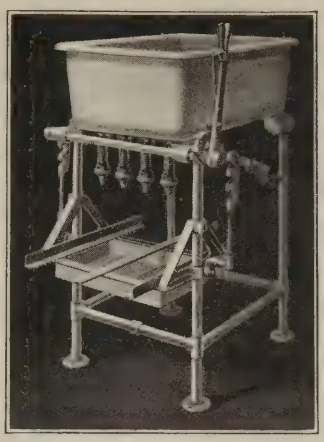
Z. G. GASSMANN

In the first place, the relation of the words "Homogenizing" and "Viscolizing" does not seem to be generally understood. At the time Gaulin brought out his first Homogenizer, he spoke in his patent of a homogeneous mass, being a mass or substance more closely put together and more perfectly emulsified. No doubt from this claim of a "homogeneous mass" he conceived the word "Homogenizer."



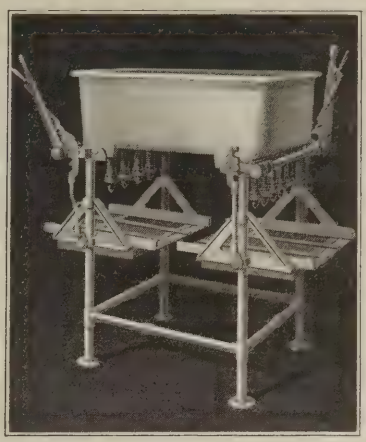
The name "Viscolizer" is a coined and copyrighted one. The machine was thus named because its action increased the viscosity of the product.

The Viscolizer and Homogenizers of different makes do practically the same work—finely dividing the fat and distributing it evenly and inseparably through the mix.



These different machines are all built on the principle of the Triplex or three cylinder pump. The reason for using a pump of this type, as explained by one manufacturer, is that in a three cylinder pump we get a continuous power stroke similar to that given by a six cylinder automobile engine. In an automobile engine the power stroke comes every other revolution of the crank shaft, while in the pump it comes every revolution. Therefore, a three cylinder pump is the same as a six cylinder engine in its relation to overlapping power.

The cloud of mystery which surrounded these machines when they were first brought out has largely been cleared away. There is a sanitary, continuous power pump, built for heavy duty—then a back pressure valve called the Viscolizing head or Homogenizing head, so arranged that the liquid going through the pump is forced through a very small aperature, between surfaces of sufficient depth to break apart the fat globules.



By microscopic examination we find that raw cream contains butterfat globules which vary greatly in size. In jersey cream the globules are larger than in cream from Holstein cows. These globules are in groups more or less, small ones being hooked onto large ones, two or three globules of the same size, etc. If this cream is run through a centrifugal or steam jet emulsor the large globules disappear, going into globules of smaller

RUNNING A WORN-OUT MACHINE IS FALSE ECONOMY.

size. The general effect on the globules is to distribute them, and the groups are broken up.

If this product is put through a viscolizer or homogenizer at approximately 150 pounds pressure the same effect is obtained. As the pressure is increased the globules are broken up to a greater degree and thus made more uniform in size.

Several men to whom I have talked have said that viscolizing or homogenizing improves any mix, but the greatest improvement is noticed in the mix of low butterfat content, say 8 per cent. As the percentage of butterfat increases the improvement is less noticeable.

From the answers to questionnaires sent out to a great many plants I find that most manufacturers prefer to viscolize or homogenize the entire mix. Inasmuch as the mix must be heated to pasteurizing temperature or very near to it, raw cream and milk can be used and the pasteurizing done in the one operation, which saves fuel. The commonly used plan is to put the cream, milk and condensed in the mixing vat, heat to the desired temperature, when the sugar and gelatine are added. Some manufacturers mix the gelatine with the sugar, dry, before adding to the mix. While there is no objection to this, I do not think that it is necessary. We have had very successful results by adding the gelatine, dry, when the mix has reached 140.

Original instructions issued with the Viscolizer advised heating to 145, holding for thirty minutes, cooling down to 110 to 125 before viscolizing. It has been found, however, that plants making mix for their own use where they do not desire to sell it, get satisfactory results without cooling down before operating.

Manufacturers differ on the temperature to which the batch should be heated, but the average I have found is 145. The acidity of the mix is a factor to be taken into consideration and it has been our experience that a mix slightly high in acidity is greatly improved by heating to 160 or 165, holding for thirty minutes and viscolizing at the same temperature.

The operating pressure used by different plants varies, but the average for plants using the viscolizer is about 2,000 pounds. Users of homogenizers report using higher pressures, averaging 3,000 pounds. This difference can be accounted for by the explanation that the surfaces of the viscolizing valve are larger than the surface of the homogenizing valve. Where the viscolizing valve in operating is usually open 3/1000 of an inch, the homogenizing valve is open from 7/1000 to 10/1000 of an inch. Experiments by manufacturers show that a viscolizing pressure of 1800 to 2000 pounds is about equal, so far as results are concerned, to a homogenizing pressure of 3000 pounds. There is, of course, a limit of pressures, and we have found that after a pressure of 2000 to 2500 pounds is reached on the viscolizer, there is no need of going higher because it is simply a waste of power, wear and tear on the machine, with no apparent results obtained.

The tubular cooler is in general use for cooling the mix after viscolizing or homogenizing. Separation is possible unless the mix is promptly cooled. This is particularly true when reconverted cream is made from sweet butter, powder, etc.

Ageing improves a viscolized or homogenized mix just like it improves any other mix. Where the mix is held less than 24 hours a commercial ripener can be used with good results. This should be added after viscolizing.

Whether existing formulae need to be altered when one installs a viscolizer or homogenizer is a natural question. Most users say that no change was necessary. As a viscolized mix of low solid content is likely to make fluffy ice cream, the overrun on which is hard to control, the change in any case where it has been necessary has been the addition of more solids to the mix. It is also possible that the greater viscosity of the mix will permit of a reduction in the amount of gelatine used by 10 per cent.

I have said very little about one of the largest uses of the viscolizer, the reconverting of cream from sweet butter, milk powder, etc. This is very satisfactorily done, and I know of cases where an entire mix of fairly good quality has been made from these products. There is no doubt, however, that better ice cream can be made from fresh cream, milk and condensed when they are procurable.

There is one more point which I have been requested to mention and which has an important bearing on the satisfactory operation of both the viscolizer or homogenizer. That is with regard to the location of the machine. These machines should never be placed above the level of the vat supplying them. While they are positive pumps and will lift the mix three to five feet it must be taken into consideration that the mix is coming through sanitary pipe and fittings which are not air-tight. When the machine is started and a vacuum is put on the suction line, air is drawn in and traps in the viscolizer or homogenizer. Air, as you know, is a cushion where liquid is concerned and when it is trapped through the pump, the pressure varies greatly, causing a fluctuation of the gauge hand and making it hard for the operator to tell what he is doing.

If it is necessary to place the machine at a point higher than the mixing vat, it is well to provide a centrifugal sanitary pump at the vat and force the mix to

the machine, keeping it well supplied. Inasmuch as the viscolizer operates against terrific pressure, the elevation of the discharge does not matter.

The one thing which impresses me with my investigation is the enthusiasm with which practically every ice cream manufacturer speaks of his machine. All of them, whether viscolizer or homogenizer users, were boosters for the process, statements being made that in some cases the mix was improved 100 per cent. While this figure may be extravagant, yet I believe we will all admit that viscolizing or homogenizing the ice cream mix improves it.

* * *

Chairman Courtright: The next on our program is by our good friend Professor Ruehe, Urbana, "Where Does the College Stand in the Ice Cream Industry?"

Prof. Ruehe: Mr. Chairman, members of the Illinois Association of Ice Cream Manufacturers, and friends. I have enjoyed the privilege of meeting with you for the past nine years, and I assure you that I do deem it a privilege. Each meeting seems to be an improvement over the previous one. Each meeting seems to be not only instructional, but inspirational, and I certainly always enjoy meeting with you.

* * *

WHERE DOES THE COLLEGE STAND IN THE ICE CREAM INDUSTRY?

I have chosen as my subject, "Where Does the College Stand in the Ice Cream Industry?" and by the term "college" I refer to both the college and experiment station.

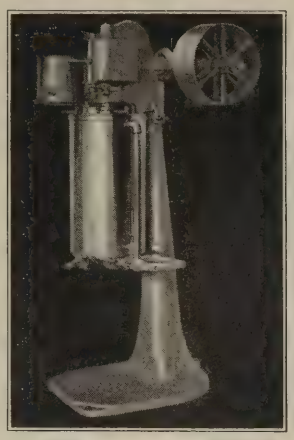
As one interested in the ice cream industry, I should like to ask whether or not the ice cream industry is interested in the college. I do not mean just interested to the extent that colleges are a good thing and necessary in the same sense as movie shows and penitentiaries, but do you consider that the college is essential to the development of the ice cream industry, and if so, what place in this development should the college take. Is it going to work with you, or are you going to say "you go your way and I will go mine?" In reality, should not our paths converge? Specifically, other industries have their scientific laboratories, why not the ice cream industry?

All of you know that there are many problems confronting this business. Every one of you has "hit a snag" some time or other, and in most cases you have tried to work out your own salvation. Why not take advantage of the opportunities which this association affords, and also the opportunity which the state university affords. The state university could in many respects serve as your research laboratory. To be sure, there would be some problems, perhaps, that it could not properly handle, but I believe it could offer great assistance in most cases. That institution belongs to you. You help to support it. Are you getting your share of good from it?

The duties of the Department of Dairy Husbandry, as far as the ice cream industry is concerned, are two-fold. First, the teaching of dairy students, in other words training men that will make desirable employees in the ice cream industry; and secondly, the carrying out of investigational work along the line of ice cream making and the making of other dairy products. This is and should be one of our main activities. However, if we are to do anything worth while along this line, we must have your co-operation. And by co-operation, I do not mean merely agreeable associations, which are a great help and greater consolation, but we must have your suggestions, advice and your criticisms.

It seems to me that this association might well have a committee on research, just as you do have a committee on transportation, etc. When problems arise, let them be reported to this committee, who in turn might seek help in solving the difficulty. I assure you that the Department of Dairy Husbandry would be only too willing to co-operate with such a committee to the fullest extent.

Such a method of working together would be a benefit to us both. Because if one concern has a problem confronting it, others have the same problem, or sooner or later will have it, and a solution of a difficulty which one ice cream maker has will be a solution of possible problems common to all. And the experiment station will be doing its duty by serving its constituency.



Investigational work is, as a rule, expensive and time consuming, varying of course with the problem under consideration. It usually requires specially trained men and well equipped laboratories. For that reason, the state institution, with its corps of trained workers and well equipped laboratories, might well serve your needs. Too frequently investigational work is misunderstood. Many people feel that if so much money is appropriated to do the work, certain definite results should be forthcoming promptly. They look at it in much the same way as they would a slot machine for gum. You drop your penny, turn the lever, and a piece of gum of definite size and the usefulness of which is definitely known, is kicked out; that is if the machine is working properly; and if not, it gives you back your penny. On the other hand, in the case of research work, you deposit your money and after a laborious task is performed, you get results which may be worth many times the cost, or it may give results which mean but little. But in any case, you get at the truth of the matter and that is the main thing.

Now ice cream is a food, but it is not a necessity from

COATED ICE CREAM BARS HELPED TO TAKE STING OUT OF PROHIBITION.

the food standpoint, because there is nothing in ice cream that cannot be obtained in other food products. However, ice cream is a necessary article of trade in that there is a demand for it. Are you as ice cream makers interested in the healthfulness and food value of your product? In other words, are you interested in your consumers, or are you only interested in finding out how cheap, how foamy, you can make your ice cream and still "get by" with it?

This reminds me of the story of a man who went into a restaurant and ordered a ham sandwich. He started to eat it and after a few bites asked the waiter where the ham was, and the waiter said, "You haven't come to it yet." When the man had eaten about three-fourths of the sandwich he said, "I have eaten most of this and haven't seen any ham yet." The maiter replied, "You've bit over it."

To be perfectly frank, I've eaten ice cream that was nearly as hard to find as was the ham in that sandwich.

If we are going to keep up and increase the demand for ice cream, we should be interested not in how cheap we can make it, but we must make our product so good, so wholesome, so satisfying, and so enticing, that the consumer will not only want it, but will demand it.

Chairman Courtright: Is Mr. Nivling of the Rochester Ice Cream Company with us this morning? We would like to have a few words from Mr. Nivling. He is the ex-president of the National Association, as I understand it.

Mr. Nivling: Mr. Chairman and gentlemen, and ladies,—when Mr. Loewenstein wrote me and asked me to prepare something for the association I said for once I would like to be able to listen and not talk, but I see he has got after me again.

When I came here and looked over the program I saw that John Knobbe was down here for a few words, and I said, "Well, that is good, that will take a long time." (Laughter).

In considering what thought I could bring to you today the thing that occurred to me was the insatiable scramble for gallonage. The lady will excuse me,—the driving all over Hell's half acre for business. It strikes me, gentlemen, that some of you are losing money. I think you are making serious mistakes on these things, and I think you should study your costs very carefully. There is a point, to use an example which is exaggerated, where you lose money in going after business. You cannot manufacture ice cream in Chicago and deliver it by auto truck profitably in Cleveland. There is a point where you are at the zero, and beyond which you lose money. The result of going too far means that you are getting a less average return per gallon than good business dictates, and I am simply going to suggest to you today that in your sectional meetings you take up this question of—how far can we profitably go in selling ice cream? That can be worked out by figuring carefully about how many days per year you will run an auto truck in an outlying section say. What is your cost for that truck? Figuring all your costs on the yearly basis, and then dividing it by the number of days during the year that you will drive that truck. If your cost is $20 per day and if you are, we will say, using it 150 days during the year, you have to figure what you can afford to pay as a delivery expense. I think that you will find unless you average about 100 gallons per day on a route you will be losing money.

You have to figure also, how far that route can be. I imagine you will find that somewhere about 50 miles for the round trip will be the limit. And so I think if you take and study this subject, I think it is going to be very valuable to you, because you should have a satisfactory average return on your investment.

You will find that for every gallon of new business you put on it requires a dollar of investment, and unless you can get a satisfactory return on that increased investment, it is poor business. If you have money to put into investments you can get a good investment today in the neighborhood of 8 per cent, so why take the danger of business if you can get a secure investment for that amount of money?

Now in business your return should be very much better than the underlying securities, and I am just giving these few things to you so you can give the subject consideration and see if you are not stretching the point too much, you are not bringing down your average return to the gallon to the point where it is really poor business to you.

That is about all I have to say. I assure you that I have enjoyed this meeting very much. I am very glad to be with you and I believe it is one of the best investments the ice cream manufacturers make, is coming to these conventions and visiting around the other plants.

Another point that occurs to me is competition. Gentlemen, I think you are missing one of the best selling propositions if you don't get and keep in touch with your competitor, if you don't sell your competitor the idea that you are there to do business and do it on the fair basis and treat him fairly. I think that is one of the most profitable ends of your business, is to get in touch with your competitor, treat him absolutely on the square, and then remember the three points, to treat the competitor right, treat the consuming public

"The Package Sells the Goods"

The Imprint of Quality

There's a positive selling appeal in an attractive Carton. Not only does an attractive package influence individual sales where there is competition and an opportunity for comparison, but it also *sells* the consumer on the business concern that respects its product enough to market it in a modern and attractive package.
It's logical for buyers to assume that the product inside an attractive high grade carton is of the same high grade and quality.

In numerous instances MENASHA specially designed Ice Cream Cartons have built up brick cream sales far beyond expectations. No doubt there is room for an increase in sales in your field. It's a certainty that a specially designed MENASHA carton will do much in helping you to accomplish your sales purpose.

We are also equipped to reproduce your three color carton design on pails.—Wire or Tape Handles or Tapeless.

GOOD FLAVORS ARE ABSOLUTELY NECESSARY IN MAKING GOOD ICE CREAM.

right, and treat yourself right, and get legitimate profits per gallon on your product.

I thank you. (Applause).

Chairman Courtright: We thank you, Mr. Nivling. The next on our program is the subject, "The Association's Exhibit at the State Fair," by Professor Ambrose. We probably will be quite interested in this, because there were only a few that got there, and we want to know some of the particulars of that exhibit, and whether it did us any good or not.

The Association's Exhibit at the State Fair.

Prof. Ambrose: The exhibit of the Illinois Association of Ice Cream Manufacturers at the state fair this year was an entirely new idea and, I believe, something which had never been attempted before by any state association.

A complete ice cream factory, with ice cream freezers, ice cream hardening rooms, and refrigeration plant, was installed and operated in the Dairy Products building at the State Fair Grounds. The people could see the ice cream made and sample the finished product.

Whenever an element of secrecy is maintained in any manufacturing process, the general public often views it with suspicion. But when your plants are open to them, when everything is clean and in ship-shape condition, when they can see and understand the processes, the safeguards employed for their protection, and find everything is being done to serve them with the best quality products, it creates a good impression and stimulates a demand for these products. This is to your advantage and to the advantage of the entire industry. That this is recognized is universally demonstrated by the fact that plants of all kinds welcome inspection parties and visitors. Some go to the extent of maintaining guides to conduct tours of inspection, but the general public, in every day life, is too busy to take the time to inspect your plants. On the other hand, when they go to the State Fair it is to have a holiday, to see all there is to be seen. Many would see an exhibit at the fair when otherwise they might not get inside of an ice cream factory. The exhibit was, therefore, of an educational nature. The purpose was to demonstrate to the public the methods of making ice cream and to impress them with the care exercised by the industry to serve a good, clean, wholesome, and healthful product.

Another purpose was to bring before the public the fact that ice cream is not only a luxury but a real food. People are realizing this more and more every day, but the "good word" must be kept before them constantly.

The exhibit itself occupied a space about 30 feet square. The Union Insulating Company of Chicago built a sectional insulated hardening room. The Westerlin & Campbell Company of Chicago set up the hardening room, equipped it with expansion coils, and installed a five-ton York refrigerating machine to cool the hardening room and to furnish refrigeration for the freezer. The Davis-Watkins Dairymen's Supply Co. of Chicago loaned a 50-quart direct expansion freezer. The Illinois Dairy Company of Springfield supplied ice cream cabinets and packing cans. Models and charts, obtained from the National Dairy Council, were used to show the comparison between the food value of a quart of ice cream and other food substances. A huge sign, 50 feet long and 6 feet high, hung over the exhibit. This sign read,

" A Tribute to the Dairy Industry by the Illinois Association of Ice Cream Manufacturers in Co-operation With the University of Illinois and the State Department of Agriculture."

A formula furnished by the association called for an ice cream mix containing 36 per cent total solids and 8½ per cent butterfat. This mix was prepared daily by the University of Illinois and shipped to Springfield.

The J. D. Roszell Company of Peoria and the Champaign Ice Cream Company of Champaign loaned the services of Mr. Walter Lauren and Mr. Grover Kisner to operate the freezers.

Samples of ice cream were served to the spectators by four girls dressed in white aprons and caps. An attractive little booklet, setting forth the merits of ice cream, containing information concerning its manufacture, together with a list of the members of the Illinois Association of Ice Cream Manufacturers, was presented with the samples of ice cream.

The serving of ice cream was discontinued while the ice cream was being frozen to permit the visitors to watch the process. The freezing process in itself was a revelation to many.

The exhibit was extremely popular. The space surrounding it was literally packed daily from 9 o'clock in the morning until 4 o'clock in the afternoon with people of every description all waiting for a chance to sample the ice cream. It would be safe to say that more of the consuming public visited the exhibit than would visit all your plants combined over a considerable period of time.

More ice cream was served on children's day than on any other one day. The news "ice cream for nothing" spread like wildfire and the children came in a continuous stream. The way the children patronized the exhibit leaves little doubt as to the future of the ice cream industry.

The original plan of the association was to manufacture 100 gallons of ice cream daily and to serve from 10,000 to 15,000 people. However, the size of the dishes was reduced to from one-third to one-half the size origi-

"If Made from Canvas We Make It"

WEST SALEM OHIO

Lawrence Ice Cream Co. Experienced Marvelous Growth*

WHAT is it that makes men successful? The psychologist tells you it is one highly developed faculty which dominates its possessor and backed by an indomitable spirit to "carry on," regardless of obstacles, those things and purposes for which he is best qualified to prosecute.

In other words the successful man—he who achieves big things, gets on a single track, drives on it and stays on it.

This story is about a successful man who upsets this formula on this one point at least. He is a man of many talents each one of which seems to be developed in equal power.

Louis B. Olin, who guides the destinies of the Lawrence Ice Cream Company, 937 W. 21st Street, Chicago, not only is a big man in physique, but a big one in "doing things." Of the aggressive, dominant type, he is what is frequently referred to, but seldom seen, a "human dynamo."

Mr. Olin has not been in the ice cream business so very long, as one measures some of his mighty Chicago competitors, and the Lawrence company only dates its history from 1911 when, as Olin explains with a smile, "It was merely a one-horse concern."

However, Olin has achieved wonders in those few years, and his achievements are not due to just one highly developed faculty which marks the big successes of most big men.

Olin is a man of many geniuses. He is an administrative man. The rapid growth of the Lawrence plant from a 10,000-gallon annual capacity in 1911, to one of 2,000,000 gallons in 1921, proves that.

He is a merchandising genius, as the city-wide distribution of the Lawrence products he has obtained, the wonderful newspaper and billboard publicity he uses and the sudden rise to popularity of "Golden-Rod" cream among the consumers attest. But there is more.

He also is an inventive genius, as the many inventions which bear his name attest and which have revolutionized several departments of the Lawrence plant, particularly in the packing the delivery end of the business.

The Lawrence plant as equipped today is declared by experts in the industry to be one of the best models in the United States and exactly what a Twentieth Century ice cream factory should be.

PHOTO COURTESY OF CANDY FACTORY

This Man Does Many Things Well and Upsets the Rule.

From the time the raw cream enters the receiving room from the railroad cars until it is delivered as a finished product to the city merchant, it never comes in contact with human hands.

The factory, which was recently constructed at a cost of half a million dollars, is equipped throughout with the latest wrinkles in methods and machinery.

The building covers a triangularly shaped block and is of the flat-iron variety, and is of brick and concrete. In the manufacturing end of the plant, not a piece of wood has been used in the construction work. The floors are composed of cement and the walls of marble.

All the machinery is propelled by direct motor which eliminates all belting. This was deemed necessary in

Packing Tubs That Will Last

Tubs of Washington Fir are recognized to be absolutely the best for ice cream packing use. Fir is used exclusively by the Government for tanks, flumes and all other purposes where water comes in contact with wood construction. It will not deteriorate under moisture. Experienced shippers are showing preference for these tubs that will give the longest service.

"ECONOMY" PACKING TUBS

are fast replacing the less durable makes. They are built from carefully selected, clear staves, with strongly constructed bottoms, and are strongly hooped. Stock tubs are green, but can be furnished in any color, stenciled and branded as desired.

"ECONOMY" ICE CREAM CABINETS

can be had in any style, Metal Lined, Tub, or Brick. All linings, cylinders and brick containers are made of galvanized Armco Ingot Iron. They are strongly built, well insulated, and highly finished, in mahogany.

INSEPARABLE COMPANIONS—THE KID AND THE ICE CREAM CONE.

order to make the plant absolutely sanitary as leather belting gathers dust.

A battery of ten new model Miller type freezers capable of solidifying 2,000 gallons of ice cream an hour handle the raw cream as it is poured from the vats.

An ice plant which turns out 200 tons of ice a day furnishes the cooling material used by the plant and the customers of the company.

The loading and receiving platforms are inside the factory proper and the loading platform has sufficient space to allow ten five-ton trucks to load all at the same time. The crushed ice is conveyed by automatic carriers to a position directly above the trucks when they are backed up to the platform and all that is necessary to ice a truck is to open a side door in the chute which releases the cracked ice which flows directly into the vacuums of the special truck bodies used by the Lawrence Company.

One man does the icing while the truck is being loaded from electric conveyors which bring the packed cans of ice cream from the refrigerator room, which is but a few feet removed from the loading platform.

Neither operation interferes with each other, and with the Olin system of truck loading and ice packing 525 gallons of ice cream are put into a truck and it is on its way ten minutes after backing up to the loading platform.

Shocking!

A young lady from the Grand Avenue Telephone Exchange recently told us that one of her friends was electrocuted last week and was in rather a critical condition. The mishap took place when she accidentally ate a piece of coffee cake with a current in it.

ILLINOIS ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 66)

nally planned, at the request of the fair officials, so that actually 400 gallons of ice cream were made during the fair. This was served to approximately 80,000 people.

The exhibit was, in reality, an advertisement. Now a successful advertisement must accomplish three things. It must attract and hold attention, it must create good will, and it must sell goods. There is no question that the exhibit attracted and held attention and that it created good will. It is impossible to determine the value of the exhibit to the members of the association with regard to increasing sales.

The association had no precedent to follow in planning the exhibit. It was more of an experiment and the experience gained should make a more effective exhibit possible if attempted again.

A number of suggestions were made in this connection. Some of these were:

First—To display a series of signs of an educational nature to supplement the large one used this year.

Second—It would be better to use an ice cream freezer of smaller capacity than the one used this year to permit the freezing of smaller amounts of ice cream at a time and at more frequent intervals during the day. This feature was one of the most important parts of the exhibit and attracted much attention.

Third—It would probably prove of considerable interest to show the evolution in methods of freezing ice cream.

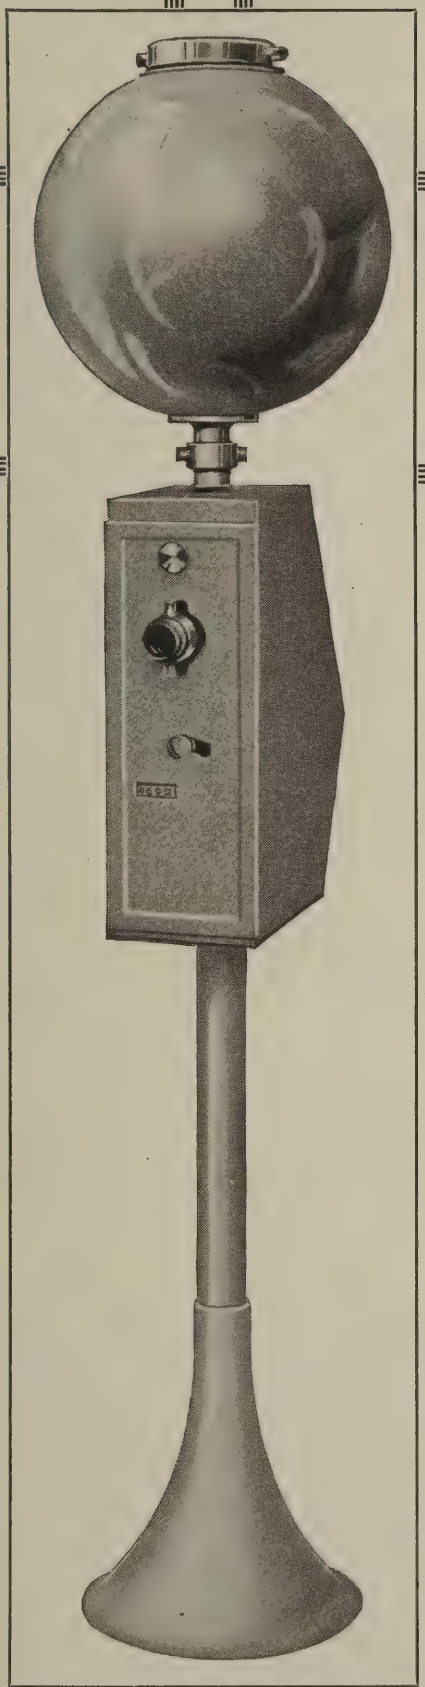
Fourth—Some means should be provided to prevent "repeaters." It has been suggested that small tickets be issued at the entrance to the fair grounds when admission is paid; these tickets to be presented for a sample of ice cream. This procedure would insure only one dish to a person, would be a means of making actual count of the number of people served, and would act as an advertisement directing more people to the exhibit.

Doubtless other criticisms and suggestions have occurred to the ice cream manufacturers who were in attendance.

In conclusion let me say that the dairy department of the university will be glad to co-operate with the association by rendering assistance in any way it can to promote the welfare of the industry.

Mr. Schwindeler: Prof. Ruehe has been a mighty good friend of the association for many years, and I want to move you that a vote of thanks of the association be extended to Professor Ruehe and Professor Ambrose for their part, not only in the exhibit at the state fair, but their interest in our industry at all times.

Duly seconded and carried.



(To be continued in April issue)

PIONEER IN DAIRY INDUSTRY DIES.

Alfred Easter, retired ice cream manufacturer and one of the most prominent dairymen in the United States, died February 1st, in Los Angeles, Cal., where he came in 1918 after retiring from business.

Mr. Easter was born in England in September, 1844, coming to this country in 1862 and settling in Detroit in 1870. He was a pioneer in the dairy industry in Michigan and in 1900 formed the Detroit Creamery Company by merging fourteen creameries and ice cream companies in that city. For fourteen years he was general manager and during that time the company became one of the largest in the world.

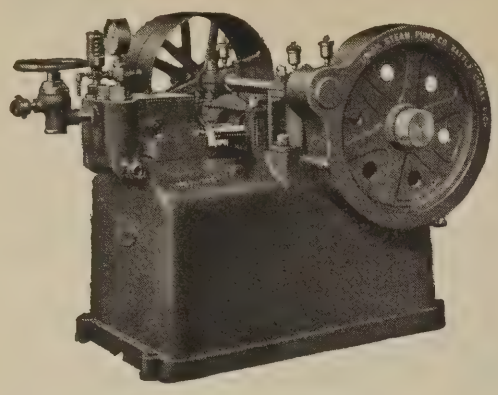
A widow and four children survive him.

TRADE MARK

The WEIBATCH
It Weighs

Mr. Ice Cream Manufacturer:—

What per cent of the mix that you pay for reaches your freezer room? What per cent of the frozen product from the freezers do you get paid for? Can you check the handling of the ingredients which go into your ice cream from the invoices of raw material, to your receipts of ice cream delivered?



The Weibatch used as an ice cream batch control not only saves time and prevents waste, but it gives an absolute and reliable check on the number of pounds of mix delivered to the freezers, and tells the amount of frozen cream that should be in the hardening rooms if the mix has been properly handled in the freezing process.

There is a Weibatch made for every purpose. If a liquid can be pumped from one vessel into another there is a Weibatch that will weigh and record it.

What the cash register is to the retail counter, the Weibatch is to the freezer room. And remember, you are losing many times their cost by not equipping your battery of freezers with them. For complete information ask your nearest jobber or write us direct.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—I would like to find out something about ice cream, as I am just starting up. This is the formula that the person used that I bought out. Is it up to the standard?

Three gals. 22% cream; 2 gals. 8% condensed; 4 gals. 3½% milk; 14 lbs. sugar; 6 oz. strong gelatine; 4 oz. Kreamo ice cream powder; 4 oz. vanilla; 2 spoonsful of egg yolk; yellow color.

Is 5½ gallons of raw mix enough in a 10 gallon freezer? It is not quite smooth enough to suit me at times. What can I do to make it smoother? I have given you the formula by gallon measure as I am not thoroughly posted on weights. Also let me know what per cent butterfat it contains, and also solids. If this formula is not O. K. I wish you would suggest me one for 8% ice cream. J. A. Y.

Reply: I am glad to give you below, in Table No. 1, the calculations showing the analysis of your mix:

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
3 gal. 22% cream—25.2 lbs....	5.54	1.75	7.29
2 gal. 8% cond.—18.0 lbs.....	1.44	3.24	4.68
4 gal. 3.5% milk—34.4 lbs.....	1.20	2.95	4.15
Sugar, 14.0 lbs.	....	....	13.30
Filler and vanilla, 1.0 lb.....	....	....	.75
Total weight, 92.6 lbs.	8.18	7.94	30.17
Per cents	8.8	8.5	32.5

You will notice that your mix figures out 8.8% butterfat and 32.5 total solids. I would suggest a slight improvement in your mix by increasing the percent of serum solids from 8.5 to 10%. You can easily do this by using 1.7 lbs. less of 3.5% milk and substituting an equal weight of skim milk powder. In case you do not desire to do that you can increase the serum solids also by adding ½ gallon more of condensed milk. In that case you could use about one quart less of sweet cream and a quart less of your 3.5% milk, that will still make your ice cream test slightly better than 8%.

You stated that at times your ice cream was not as smooth as you would like. Increasing the serum solids as above indicated would help to make a smoother ice cream. It is also possible that you are freezing your mix too soon after making it at times. A freshly made mix will not make as good a product as one that has been aged from twenty-four to forty-eight hours at a low temperature.

* * *

Dear Sir:—Would be pleased if you would let me know my milk solids, butterfat, and total solids in the formula below.

I use the 30% emulsified cream. I get my milk from the dairy here. It will test 3%. This is my mix: 168 lbs. 3% milk, 84 lbs. 30% emulsified cream, 34 lbs. sugar, 10 lbs. milk powder, 2¾ lbs. gelatine in 1 gal. water, 6 oz. extract, 5 oz. egg yellow.

Respectfully, A. M. & CO.

Reply: I have analyzed your mix for you below, in Table No. 1:

A New Package System for Bulk Ice Cream

A Handy Means of Selling Bulk Ice Cream Packages that should appeal to every Dealer and make the Field a bigger one for the Ice Cream Manufacturer

IT WILL no doubt be conceded that bulk ice cream is the main-stay of every ice cream manufacturers' business,—it is the one thing that creates the volume which makes a reasonable profit possible. The specialties are a great incentive to promoting trade and opening up new outlets, but bulk ice cream in volume is the one thing that the ice cream industry has grown up on and the one thing more than anything else that has helped to make the industry worth while for those who are in it.

Manufacturers have done much to promote sales of ice cream. Many means of advertising have been tried to reach the consumer and create a desire for **more** ice cream. It would seem, however, that enough stress has not been laid on the attitude of the dealer toward the distribution of larger quantities of bulk ice cream. And why should not the dealer be indisposed to boost the sale of bulk ice cream for home consumption?

Place yourself in the position of the dealer running a community store who handles ice cream as a side line and has a number of customers waiting for regular lines of merchandise. One of them, however, asks for a quart of bulk ice cream. Other customers become impatient and all the while he thinks of his ice cream profits shrinking as the warm air settles down the volume of the cabinet. Naturally a dealer in this frame of mind has little inclination to make suggestions to his customers about taking home a quart of bulk ice cream. Of course he may have the brick packages, but if you will take a census of many of the average dealers' customers for ice cream, you will find that many prefer ice cream in bulk for a good many occasions.

What a better feeling the dealer would have if he could just reach into his cabinet and hand out a pint or quart package of good, sanitary, packed in the factory, bulk ice cream. Think of the time it would save, how much more sanitary it would be, how much more the product would be like the fine piece of goods it is as it leaves your factory, and the incentive for the dealer to want to push a package of this kind for home consumption. Practically everything the community store handles is put up in packages by the manufacturers,—crackers, prunes, raisins, sugar, potato chips. The consumer gets correct measure,—the dealer suffers no shrinkage, and the product is delivered as the manufacturer made it.

With this tendency toward packages for all food products, why should not the sale of bulk ice cream advance with the elimination of the cumbersome dipping and the addition of the sanitary feature of being "packed at the factory."

The Hunt-Crawford Company of Coshocton, Ohio, have developed something new along the line of selling bulk ice cream in packages. They are manufacturers of cellular paper products and in addition to making a bulk package for pints and quarts as shown in the illustration—also a container for chocolate coated ice cream bars,—they have developed a complete and novel system of handling these packages.

The system consists of converting the regular cabinets into a series of three galvanized iron cells of cloverleaf design around which the ice is packed, perforated so that the brine can circulate around the cans going into the different cells. Each can holds seven quart packages or a corresponding larger number of pints. With three individual cans,—one can being used for pints, one for quarts and the other for counter trade. Or, the quart section will accommodate several quart packages and several containers holding one dozen each of chocolate coated ice cream bars. This big variety can be had with a very simple and inexpensive equipment which the Hunt-Crawford Company also supplies.

And the packages are easy to remove, because each cylindrical can is fitted with an "elevator" which will bring the last package to the top just as easy as the first one with but a slight upward pull. This elevator does away with the difficulty of getting out packages when very cold or frozen. The packages are filled directly from the freezer or can be used on the Mojonnier automatic filler. No special forms are required, and no cutting is necessary to get the ice cream into the desired shape to fit the packages.

Special hardening room equipment is unnecessary with this system as the packages as filled direct from the freezers can be placed into the tin cans that slip into the cabinets just the same as you would handle your regular bulk cans for hardening. When making deliveries these same cans are taken from the hardening room, packed three into a five-gallon packer, if for shipping, or handled as you would any other bulk container for local truck deliveries.

If more than one flavor is desired for the same package it is possible with a little care in filling, to first fill the containers half full with the one flavor from one freezer and then pass directly on to the other freezer for filling with a second flavor.

This style of package can also be printed with the usual attractive advertising. It is light in weight and lined with a sanitary vegetable parchment paper.

The manufacturer using this system saves the washing of cans, uses his same cabinets and packages and has a wonderful selling argument for developing trade with new dealers. This should be a big aid where competition is keen. The idea commands attention and is no doubt another forerunner of the rapid strides being made in the ice cream industry.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
168 lbs. 3% milk	5.04	14.34	19.38
84 lbs 30% cream	25.20	5.25	30.40
34 lbs. sugar	....	....	32.30
10 lbs. skimmilk powder	....	9.50	9.50
2.75 lbs. gelatine	....	....	2.60
8.34 lbs. water	....	....	....
.70 lb. extract and color	....	....	.30
307.79 lbs.	30.24	29.09	94.48
Per cents	9.80	9.4	30.6

Per cent sugar, 11.03.

You will notice that the butterfat content of your present mix is below 10%, and also that your total milk solids are a little below 20%, the total solids being 2 or 3% lower than should be for a good ice cream. You will also notice that the percent of sugar in your mix is only 11%. You should use at least 12% sugar. In order to bring up the butterfat in your mix you would have to use a little more cream and the milk solids can then be brought up by adding a little more skim milk powder. I presume that you are pasteurizing your entire mix, and I would further suggest that instead of dissolving your gelatine in water you mix the dry granular gelatine with some of your sugar and introduce this into your milk and cream when you have it up to the pasteurizing temperature. The skim milk powder can then be thoroughly mixed with the remainder of the sugar and introduced into your milk and cream at a temperature of about 110 degrees, or before it has reached the pasteurizing temperature.

* * *

Dear Sir:—Will you please work out a formula for us of about 100 gals. Mix to contain 12% butterfat, 35% total solids, 11% serum solids. This mix to be made out of skim milk, milk powder and sweet butter, gelatine and sugar. T. A. C. CO.

Reply: I am giving you below, in Table No. 1, suggestions how you could make up a mix which would comply with your standard of 12% fat, 11% serum solids, and 35% total solids:

Table No. 1.

900 lbs. mix, 12 per cent fat, 35 per cent total solids.

Ingredients	Fat	Serum Sol.	Total Sol.
108.0 lbs sugar	....	....	102.60
4.5 lbs. gelatine	....	....	4.05
129.0 lbs. butter, 84%	108.36	....	108.36
52.0 lbs. skimmilk powder	....	49.40	49.40
606.5 lbs. skimmilk	....	53.98	53.98
900.0 lbs.	108.36	103.38	318.39
Per cents	12.04	11.48	35.67

I trust that this will serve your purpose, and at any time that I can assist you further I shall be very glad to have you write again.

* * *

Dear Sir:—Would you figure out the total solids and butterfat in the following mix, which I have been using for some time and has proven satisfactory: 30 gals. 36% cream, 30 gals. 7% condensed, 60 gals. 3.5% milk, 7½ lbs. gelatine, 6 gals. water to soak gelatine, 156 lbs. sugar, 8 oz. flavor and color concentrate vanilla.

If you could suggest and changes would like to have you do so. I emulsify my whole mix. This makes 24 batches. I get from 246 to 250 gallons of finished cream.

Yours, E. C. N.

Reply: You will find the calculations for butterfat and solids below in Table No. 1:

Send for this Bulletin

Every Ice Cream manufacturer should read this bulletin, especially if you are using ice for freezing and hardening your cream.

It contains interesting information — facts about better refrigeration—how to reduce manufacturing costs—how to eliminate spoilage and shrinkage — how to improve factory conditions.

BAKER SYSTEM
Mechanical Refrigeration

Baker Systems are designed by expert refrigerating engineers to meet individual requirements in the most efficient and economical manner. There are hundreds of Baker Systems giving their owners genuine service —perfect refrigeration in the general storage room—mixing room, machinery and vats —for the freezers—and a zero temperature in the hardening room, as well as the manufacture of ice for packing and shipping.

Baker expert refrigerating engineers are at your service—glad to talk over your problem without obligation.

Baker Ice Machine Company Inc.
Omaha, Neb.

BRANCH OFFICES IN THIRTEEN CITIES

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
30 gal. or 426 lbs. 36% cream	88.50	14.07	10257
30 gal. or 270 lbs. 7% condensed	18.90	48.60	67.50
60 gal. or 516 lbs. 3.5% milk	18.06	44.33	62.39
156 lbs. sugar	....	....	148.20
7.5 lbs. gelatine	....	....	7.12
.5 lb. vanilla	....	....	.10
50 lbs. water	....	....	....
1246 lbs.	125.46	107.00	387.88
Per cents	10.06	8.58	31.13

You will notice that your mix figures out 10% butterfat and 8.5% serum solids which makes a total of about 18.5%. In my judgment this is not quite enough milk solids for a well balanced ice cream. You undoubtedly have read some of the material which I have published on this subject. I have always maintained that in ice cream there should be at least 20% milk solids. An ice cream testing 10% butterfat should have at least 10% serum solids and at least 32.5 to 33% total solids.

The estimated yield of your ice cream as I have figured it out should not be over 250 gallons for your mix, which allows for an overrun of 70 to 80%. You could, by increasing the milk solids and total solids of your mix increase your overrun to 90 or 100% and still make a most satisfactory ice cream.

Dear Sir:—We would like a little information regarding our ice cream mix and will be greatly obliged if you will supply it.

The following is our mix as used the past season. From this mix we have drawn from 425 to 435 gallons of finished ice cream of very good quality. We would like to change this mix and cut out the condensed and use skimmilk powder in place of it to build up solids. We would like to have you figure out a formula for us on this basis.

The mix used the past summer is as follows: 360 pounds of condensed, 12 per cent fat; 192 pounds of butter, 82 per cent; 280 pounds of sugar, 115 pounds of skimmilk powder, 255 pounds of skimmilk, 7½ pounds of gelatine, 784½ pounds of water, 6 pounds of flavoring, color and ripener.

This makes a total of 2,000 pounds or 40 50-pound batches. Kindly analyze this mix for us, also figure out a new mix, substituting skimmilk powder for the condensed milk for which we will be greatly obliged.

G. C. Co.

Reply: I have your letter of recent date with request to work over your ice cream mix. I have a short course class in ice cream making at the present time and I have asked the class to work over your mix and I am giving below in Table No. 1 the analysis of your present mix and I am suggesting below in Table No. 2 how this mix could be worked over to eliminate the condensed milk and substitute additional butter and skimmilk powder. All of these calculations were made by the short course class. I thought perhaps that you would be interested in knowing this illustrates the kind of work we are doing in short courses.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
360.0 lbs. condensed	43.20	79.20	122.40
192.0 lbs. 82% butter	157.44	.....	157.44
280.0 lbs. sugar (14%)	....	.....	266.00

Per cent	10.03	10.55	34.29

* * *

Dear Sir:—I wish to thank you very much for your help in the past and to ask your assistance again. Your department in The Ice Cream Review is one of the best parts to that magazine as your answers to other's questions have helped me very much.

In using a certain brand of skimmilk powder I have been compelled to mix it with water and strain before putting in the pasteurizer as there is a considerable amount that will not dissolve. I did not do this with my first batch and it had a chalky taste that was very displeasing. Should this be necessary with a good brand of powder? Out of each pound there would be almost a handful of powder that would not dissolve.

In adding gelatine to the mix, I have been adding mine dry at 145 degrees and find that it incorporates in the mix in fine shape. Has the cooking any advantage over this method?

In a mix balanced as to food value do you think that about 11 per cent milk solids, 12 per cent sugar and from 12 to 14 per cent fat would be right?

In making a mix with butter and skim powder would

QUALITY PAYS BEST AND ENDURES LONGEST—MAKE QUALITY YOUR MARK.

you advise pasteurizing to about 145 degrees before adding condensed, sugar, etc.?

D. H. B.

Reply: I have your letter stating that you have had trouble in dissolving skimmilk powder for your ice cream mix. You undoubtedly have an ice cream powder which is old and partly insoluble or hardly fit to be used in ice cream. A good ice cream powder should be perfectly soluble and it should not be necessary to strain it.

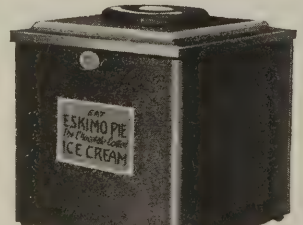
In the matter of adding your gelatine dry into your mix at 145 degrees I am glad to state that there is absolutely no objection to this and it has every advantage over the cooking method. In making up a mix 12 per cent sugar along with 11 per cent mlik serum solids and 10 to 12 per cent butterfat, you will have a mix which should make a satisfactory ice cream in every respect.

There is no advantage in using 12 to 14 per cent butterfat unless you desire to do so. It is not necessary to wait until you have your mix up to the pasteurization temperature of 145 degrees before you add your condensed milk and sugar. This can be added at any time while your mix is heating and before it gets up to that temperature. I trust that these few suggestions will assist you.

* * *

Dear Sir:—We are using the following mix and would kindly ask that you analyze it and state where we could improve. We have had a few complaints with our ice cream not being just exactly right, but can find nothing wrong with our process.

740 pounds, 3.5 per cent milk; 62 pounds skim powder, 75 pounds sweet butter, 120 pounds sugar, 7 pounds gelatine, 4 pounds flavor and color.



STOUT

Schroeder Perfection Cabinets

Our Eskimo Pie Special

Assures proper distribution of this new delicacy

1922 Cabinets now ready for shipment.

"Insulation is the thing"

JOHN SCHROEDER LUMBER CO.

"A Dozen Cabinets or a Dozen Carloads"

WALNUT ST. --- MILWAUKEE, WIS.

We pasteurize this mix, with the exception of the flavor and color, at 145 degrees for 30 minutes, run it through the viscolizer at this temperature nad hold at 40 degrees for 18 hours before freezing with 8 degrees brine. We are getting 220 gallons finished product from this mix.

St. C. D. Co.

Reply: I am glad to give you the analysis of your mix below in Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
740 lbs. 3.5% milk	25.90	63.19	89.09
62 lbs. skimmilk powder	....	58.90	58.90
75 lbs. 84% butter	63.00	.....	63.00
120 lbs. sugar	....	.....	114.00
7 lbs. gelatine	....	.....	6.65
4 lbs. flavor and color	....	.....	.60
1,008 lbs. mix	88.90	122.09	332.24
Per cent	8.82	12.2	32.2

You stated that you were pasteurizing the entire mix at 135 degrees for four minutes and then running it through the viscolizer and also that you were getting 220 gallons of finished product. All these processes are carried out above right and you should have no trouble in getting a satisfactory ice cream from that standpoint.

You will find on looking over the table above that you are using a little better than 12 per cent of milk serum solids in your mix and you are also using .7 of 1 per cent of gelatine. It is possible that the complaints which you state that you have had are due to too high a per cent of gelatine which makes your ice cream a little sticky; or the high per cent of milk serum solids may be responsible for the complaints. You did not state in your letter just what the complaint was. If you will do that I shall be glad to give you further advise.

* * *

Dear Sir:—Wish to produce a good ice cream that will give a butterfat content of 12 per cent.

We desire to use: Sugar, gelatine, condensed milk, 4 per cent; cream, 26 per cent; milk, 4 per cent; vanilla per cent. Please favor with a 100 pound mix.

W. E. & SON.

Reply: I am glad to suggest below in Table No. 1 how a satisfactory ice cream mix can be made from the ingredients suggested in your letter.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
14.0 lbs. sugar	....	.....	13.30
.5 lbs gelatine	....	.....	.47
39.0 lbs. 26% cream	10.14	2.56	12.70
14.28 lbs. condensed	.57	3.71	4.28
32.22 lbs. milk	1.28	2.75	4.03
100.0 lbs.	11.99	9.02	34.78

Trusting that this is the information that you desire, I am.

* * *

Dear Sir:—What yield should one get out of the following raw mix to equal 100 per cent over-run? 115 gallons cream, 140 pounds sugar, 4 pounds gelatine.

W. I. C. CO.

Reply: In order to get 100 per cent over-run you should secure 250 gallons of ice cream from your mix. You can arrive at that figure in the following manner: 115 gallons of cream at 8.3 pounds to the gallon will weigh 954.5 pounds; add to this 940 pounds of sugar and 4 pounds of gelatine makes a total of 1,098.5 pounds. Your ice cream with 100 per cent over-run should weigh 4.4 pounds to a gallon. Dividing 1,098.5 by 4.4 pounds will show the yield you should get, amounting to 250 gallon.

Six Times Original Size

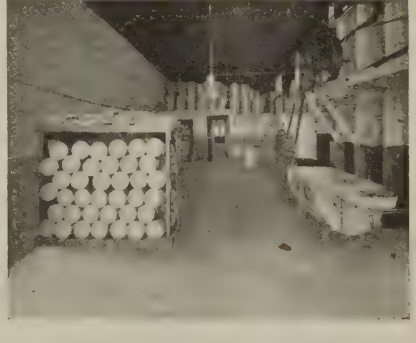
Texas Plant Shows Remarkable Growth in the Short Time It Has been in Operation

That service is its own reward is shown by the thriving business of the Velvet Ice Cream Company, Paris, Texas. In 1919 in three small rooms—today housed in their prosperous home shown here. With service the keynote, with A. H. Cox as superintendent and R. L. Bryant as general manager, equipped throughout with the most modern machinery this plant has met with spectacular success from the very beginning. It is one of the finest in the entire southwest.

Always "the customer first," and no expense spared in producing the highest grade produce possible. No other food is perhaps quite so delicate as ice cream and exquisite pains must be taken to safeguard it in all stages of its manufacture. Dietitians are beginning to realize that one of the most healthful forms of taking milk into the system is as ice cream, provided, of course, that scrupulous care is given to details. The Velvet Ice Cream Co. has considered the effort well worth while. During the calendar year 1921 they spent for cream and milk some $100,000. Most of this will go into ice cream, to be sure, but there will be a development of the butter business as fast as it can be consummated.

In the Milk Pasteurizing Room of the Velvet Ice Cream Company Where They Are Using 500-Gallon, 150-Gallon and 50-GallonPasteurizers, All Steel Body, Belt Driven.

Note the neat arrangement of the three Cherry batch mixers, also the cuts of the freezing room showing two Perfection freezers and viscolizer, and finally the room where the milk cans are sterilized with a Perfection ice cream can washer. Just outside a fleet of trucks awaits to expedite deliveries. Not a hitch anywhere along the line—nothing to mar the complete arrangement—nothing to cause a customer to call up and complain of the service.



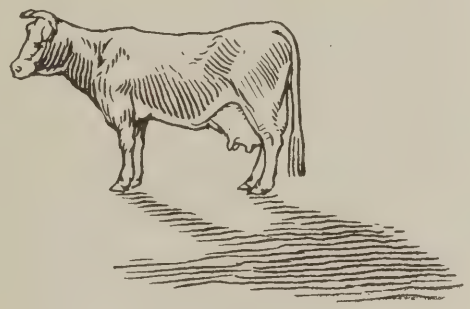
A plant like this not only reflects credit on the local management, but is a distinct asset to the industry in general. It is visiting just such concerns as this that makes the public believe in ice cream and want more of it. It is the best kind of propaganda going.

The company's brand of "Velvet" butter has become as well known as that of their ice cream, and the demand for their butter far exceeds their output, which is somewhat retarded by their inability to get sufficient butterfat from the farmers. Their butter is marketed in Northern Texas and Southern Oklahoma.

Their advertising is done direct to the customer, through personal letters and house to house canvassing. This results in the consumers' demand upon the merchants for the Velvet products.

The attractive exterior of the Velvet Ice Cream Company's Plant.

Where the Cans Are Washed.



The Freezing Room in the Plant of the Velvet Ice Cream Company.

Their delivery service is thorough and unique. Each local order is written up, and timed on the face of the blank the hour and minute received, and in case of any delay in returning the customer's receipt for delivery, or the amount due in case of a cash purchase, the delivery man has an explanation to make.

A NEW SIGN

AN individual's photograph gives you a visible concrete image of that person, no matter how many miles separate you. But one photograph cannot picture for you a *business* and its organization such as ours. A hundred photographs would have to be employed to show you the many factories, the offices and warehouses. Many more would be necessary to show you each individual member of this complex group of workers. Even then you would have no pictures portraying the *accomplishment* of quality, of service, of progressiveness and all the other factors that breed respect and good will for a business organization. And so we use a SIGN. Whenever you see our octagon-shaped emblem you will learn to know that it stands for our new firm name, our entire line of equipment and our organization.

Our sign is not totally new. Many will recognize the "Bestov" it. The old Bestov trade mark represents forty years of service to the dairy industry. We expect to make it the symbol for "best of all" equipment and service.

When you see this new trade mark remember it is the sign of:

We are successors to:

The Manufacture of Gelatine

By CARLETON BATES of the United States Gelatine Co., Milwaukee, Wis., before the Michigan Association of Ice Cream Manufacturers at Saginaw, February 15 1922

IT IS with regret that the proposed illustration by cinematograph of the manufacture of gelatine could not be effected. Such illustration would probably more graphically describe and impress you as to the magnitude of the gelatine industry, but if you will bear with me for a short time I will try to describe how gelatine is manufactured, the raw materials employed, etc.

It is probably of great interest to the majority of you to know how one of your ingredients is manufactured and what care is taken by the gelatine manufacturer to insure a uniform product for your use in ice cream. You probably all ask, "What is the difference between glue and gelatine?" These two terms, glue and gelatine, like many commercial terms are not strictly defined. Gelatine comes from the Latin—glare, to congeal; while glue comes from the Latin—glus, which is akin to gluten, from gluere, to draw together.

Gelatine is met with in slightly amber or nearly colorless thin sheets and is used for purposes in which the absence of taste, odor and color, with firmness of jelly, easy solubility and ability to act as a binder are required. You, however, are more familiar with gelatine in the powder form which has the appearance of being a bright light colored crystalline substance.

There are two kinds of gelatine on the market, vegetable and animal. The vegetable gelatines are made from Irish Moss, Japanese sea weed, etc. This product is used for candies, ice cream, technical laboratory work, etc., but is not used as extensively as is the animal gelatine. Of the gelatines of animal origin there are three classes.

(a) Skin gelatine from carefully cleaned and treated intercellular connective tissues.

(b) Bone gelatine, from crushed acidulated bone.

(c) Fish gelatine, from bones, skins and bladders of fish. Fish gelatines are met with in the form of isinglass and are rarely, if ever used for food. Bone and calf skin gelatines are, therefore, the only ones we are concerned with.

The bone stock consists of bone from which the fat has been extracted and the mineral matter removed by treatment with acid. It is known as osseine, from crushed bones, dentelles from scraps of bones left from the manufacture of buttons, knife handles, etc., and horn piths from the bony piths of horns.

Of the calf stock there are two kinds, green and salted stock from domestic tanneries, and dry imported stock. Both consist of pates, the face of calves including the ears and splits. Splits are the inside pieces of hides split off before tanning.

The stock, either bone or calf, is prepared for extraction by treatment with milk of lime. Previous to this treatment the stock is first washed free of salt and dirt in washmills especially constructed for this purpose. In the treatment of milk of lime the time varies from 4 to 5 days in the case of some bone stocks to fourteen weeks in the case of calf pates. Three or four treatments with milk of lime are necessary in order to cleanse the stock properly. In order to keep a plant operating you can readily see the amount of raw material and space necessary to have the stock in process fourteen weeks.

After the liming treatment the stock is acidulated to remove all traces of lime and then washed to a neutral point. It is then ready for extraction which is carried on in large cook kettles. Several extractions are made from the raw material, each extraction at a higher temperature than the previous one.

From three to seven extractions are made, depending upon the practice of the various manufacturers, the digestions varying from 155 degrees Fahrenheit to boiling. After extraction the liquors are filtered to remove coagulated albumen, some peptone and foreign matter, and may be condensed by evaporation when the liquors are then poured upon endless belts and set up in the form of jelly. The jelly is then spread on nets and dried in currents of warm air into the sheet of gelatine.

In order to conform with all food laws and factory regulations gelatine liquors are never allowed to come in contact with prohibitive metals such as copper, zinc, etc. For this purpose glass enamel tanks and pipes are employed for holding and conveying the gelatine liquors, and in order to reduce the bacterial actions double lines are often employed so that one may be sterilized while the other is in use.

The grade of gelatine produced depends upon sanitary and sterile conditions as much as upon the raw materials employed. After drying, the sheet gelatine is broken into chips and then ground for the consuming trade. It is practically impossible to manufacture gelatine day in and day out of a given grade and for this reason gelatines are not graded until after a final test has been made as with regard to the viscousness of the gelatine and the strength of the jelly when set. By the viscousness of the gelatine is meant the ratio of the time of flow of the gelatine solution to the time of the flow of water through a given orifice at a given temperature. The jelly strength is measured by the weight or pressure which a jelly will withstand without breaking.

In connection with these tests the appearance and color of the sheet gelatine are also used in determining the final grade of gelatine. The method of testing the viscosity and jelly strength of gelatines varies with the different manufacturers, but all methods are really a ratio reading of the gelatine as compared with water.

The highest testing gelatine produced are extracted at the lowest temperatures because the more heat applied the greater you are forcing the gelatine liquors out of the raw material and you therefore reduce the strength of the resulting jelly. This does not mean that the later extractions are not as pure as the extractions at the lower temperatures, because they are. They are

FOR YOUR INFORMATION

Our Ice Cream Manufacturers, Milk Plant and Creamery catalogue will have illustrations and give full information on machinery and supplies, and be ready for mailing about March 15th, 1922, with up-to-date prices.

We will not send these catalogues out promiscuously, but only to our customers or bona fide applicants, who are interested in receiving our catalogue and request us to place their name on our mailing list. **If interested write today.**

HERE IT IS!

The Frick Bottom Hoop

For Ice Cream Tubs

With this hoop you can replace bottoms that are out or repair weak bottoms, making them stronger than when new. In either case, your tubs if equipped with Frick Hoops will last two or three times longer than a new tub of the present type.

This Hoop is made of No. 12 gauge, rust-resisting ARMCO INGOT IRON—hot galvanized after manufacture — rivets are made of rust-resisting metal.

Bung, Tube and Nut made of cast iron—heavily galvanized. Notice the construction — this hoop is not driven on, but PUT ON SNUG.

The Hoop comes up side of tub far enough to hold bottom of staves secure—the lugs are riveted to staves, making it impossible to weaken or knock the bottom out by rough handling. The bottom end of staves are not exposed in any way. Our Bung insures a *tight* bunghole.

Equip all your tubs with Frick Hoops

Made in all sizes for average 20-quart ice cream tubs

FRICK HOOP COMPANY

CORSICANA, TEXAS

made from the same raw material in exactly the same way but are generally a little lower testing.

One of the most important points for the control in the manufacture of gelatine is to control the action of putrefactive liquefying bacteria upon the liquors during the course of manufacture. Since these liquors contain besides gelatine, the peptones and proteoses which are degradation products the liquors constitute an admirable nutrient media for the growth of most organisms. That the action of the nutrient media has considerable influence on the growth and development of bacteria is a fact well recognized by chemistry.

The course that most naturally suggests itself is to keep the liquors at a reaction and temperature least favorable for the propagation of bacteria. It is not well known what happens, when owing to the influence of bacteria or chemicals, gelatine refuses to jell. Bacterial liquifaction of gelatine invariably leads to ultimate putrefaction, but the converse is not true, since a solid gelatine may turn putrid without liquifaction. It is common knowledge that the liquifaction of gelatine is due to the proteolytic enzymes secreted by certain bacteria which split up the gelatine molecule into its ultimate products of disintegration; amines, amino, acids and very often ammonia. To the manufacture of gelatine the percentage of gelatine in the liquors is a matter of vital importance and it is therefore, necessary to pay the best attention to the conservation of the gelatine molecule as much and in no way permit the growth of bacteria.

The drift of gelatine users has been toward the highest testing gelatine possible. Such continued use has made the purchase of the highest testing gelatine costly. There are certain lines in which none but the highest testing gelatine can be used and it is therefore necessary to use a medium test of gelatine for other lines.

I want at this time to leave with you the idea that lower testing gelatines are of the same high purity as are the higher testing gelatines. If the stock is properly treated before extraction there will be no odor to the second and third extraction gelatines which are the lower testing. These gelatines contain no more of the heavier metals, suphite, etc., than do the first extraction gelatines and the clarification would be equally as good. I do not want you to go away with the idea that only high tseting gelatine is odorless but that all extractions of gelatine from the same raw material are of equal high grade guaranteed purity the only difference being in the strength of the jelly obtained from each. By using slightly more of the lower testing but otherwise equally high grade gelatine you may be able to show a saving of the manufacturing cost of your product with an equally good article.

ANOTHER CLAIM TO THE FIRST ICE CREAM.

The President of the National Association of Ice Cream Manufacturers, Mr. S. T. Nivling, is reported as authority for the statement that the first ice cream was made in Italy by an Italian, living near the foot of the Alps Mountains, seventy-five years ago.

The original ice cream man carried a bucket of sweet cream up above the frost line on the side of the Alps and surrounded it with snow. He kept stirring the cream with a paddle and scraped away the "ice cream" as it froze to the sides of the bucket. This was the earliest recorded method of making ice cream and was kept up for years, accidental experiments gradually changing the making of ice cream to simpler yet crude ways, until fifty years ago ice cream making started in a commercial way in England before it was attempted in the United States.—Ice and Refrigeration.

DEVICE TO TEST FREEZING TEMPERATURE.

To facilitate the study of problems in ice cream making, such as sandiness, viscosity, and the rate of crystalization, the dairy division of the United States Department of Agriculture has made a new application of devices for taking and recording temperatures electrically. The apparatus is known as a rotating thermocouple and cold junction, and by its use it is possible to take temperatures continuously in the interior of power ice cream machines while the mixing is being done, the readings being taken several hundred feet away, where the accuracy of the recording instruments is not disturbed by machinery in the plant.

The use of mercurial thermometers for this purpose is obviously impracticable, says a bulletin of the department in explaining the device, not only because it would be necessary to stop the mixer to read the temperature but also for the reason that a glass thermometer can not be used under such conditions. With the new apparatus the stage of freezing in the "mix" can be ascertained at any time as the process goes on, and the temperature may be obtained with accuracy within one one hundredth of a degree centrigrade.

"The temperature measurement is based upon the principle that if two electrically conducting wires of dissimilar materials are connected at their ends and one end has a different temperature from the other an electric current will be caused to flow through the wires," continues the bulletin. "The difference in potential between the ends will be very nearly proportional to the difference in the temperatures between them. In the ice cream freezer five such pairs of wires are connected in such a way that the normal effect is multiplied. One set of the wire junctions extends into the 'mix' from the shaft, while the other set is located in an ice pack which rotates with the shaft outside of the mixing chamber. The current is transferred from the revolving shafts through copper disks that rotate in baths of mercury. An original part of the apparatus is the manner of maintaining the ice pack or cold junction on the moving shaft.

"Although the apparatus was designed for use in scientific investigations of problems in ice cream manufacture, it is expected that it may find application in commercial plants."

A man may succeed in making a fool of himself without exciting envy, but success in any other object always brings some detractor to the front.

Breyer's Homogenizing Plant

Includes Two

GAULIN Homogenizers

A FEW may equal but none can surpass the quality of ice cream produced by the Breyer Ice Cream Co., Philadelphia. After experimenting with others they have standardized on Gaulin Homogenizers and every ounce of the mix producing 4½ million gallons of ice cream in a year goes through these two machines.

The Breyer Ice Cream Co. has the reputation of being one of the most efficiently managed plants in the country and their decision in favor of the Gaulin was based on careful tests. It speaks volumes for the efficiency of this homogenizer.

Most of the other plants in America producing quality ice cream have also standardized on Gaulins. They have learned that while a good ice cream maker can produce good ice cream with ordinary equipment, the same man can produce better ice cream and do it easier with a Gaulin. Every particle homogenized in the Gaulin must pass through the Gaulin Spring Homogenizing Valve which crushes it under a pressure of 4,000 lbs. Furthermore, the spring valve feature prevents clogging of the valve as is the case with rigid valves as found on ordinary machines purporting to do what the Gaulin does.

REFRIGERATING SYSTEMS
DAIRY MACHINERY AND SUPPLIES

Opportunities in Refrigeration Engineering

By GEO. G. HOECKER

FEW, if any industries, present to the earnest and diligent engineer, the many splendid opportunities offered by the refrigeration industry.

A comparatively young industry, refrigeration has, during the last generation or so, grown into a gigantic enterprise that has spread all over the globe and has brought with it a most remarkable demand for men of technical training, who are capable of visualizing the important relationship of the ice industry to almost all other phases of the world's commercial work.

Step by step, the refrigeration industry has kept pace with the magic development of electricity, and it has expanded under most favorable circumstances. It would indeed be impossible to set a limit to the prospects which this industry offers to the man who is willing to make it his life work and supplement his efforts by intelligent and progressive methods.

Science rules the universe and technic governs practice. Experience has taught the modern manufacturer and producer the need of competent men at the head of his various departments who, aside from being well acquainted with the practical work, have a technical training which admits of taking up lost motion in the general operations as well as to inaugurate economics.

This is true of the progressive ice and cold storage plant owner. He desires to keep his plant astride with scientific developments in his industry. He is always glad to have a man at the helm of the practical operations who has been fortunate enough to have had a technical training and is therefore in a position to cooperate in maintaining modern economical methods.

As far back as 1907, the Siebel Institute of Technology, realizing the urgent need of a complete course in refrigeration engineering, decided to conduct such a course which would also include all kindred subjects, such as steam, electrical, mechanical, and chemical engineering.

As it was evident that the practical engineer who would be most interested in this course would be unable to absent himself from his plant for any considerable length of time, it was necessary to devise a training system which would eliminate all unnecessary details and yet afford thorough and complete instruction in all essential features.

Through its many years of experience in other courses of instruction, the faculty of the institute was able to devise constructive methods providing for the personal training of each individual student. While this naturally limited the class to a small size, the method permitted the covering of a vast field of subjects, equivalent to years of training under ordinary conditions. The duration of the course was set at three months.

In 1907 the first course started and its attendance indicated plainly the demand for technically trained men on the part of both engineers and plant owners. Accordingly the course was conducted yearly since that period with ever increasing success.

With the coming of the world war, the course was necessarily suspended. The great conflict brought with it too many sudden and radical changes in every industry, especially in the refrigerating industry and the institute was confined to keeping a close check on all new developments so as to be able to incorporate them in the curriculum when the refrigerating engineering course was again resumed.

In this work, the institute was effectively aided by its affiliation with the largest engineering associations and publications in the industry, and it was at the instance of Mr. J. F. Nickerson, editor of "Ice and Refrigeration," that on January 23rd, another class in Refrigeration Engineering was started.

It was decided to insure the success of this first engineering class, training under the revised and completed curriculum, by limiting it to twelve members, which necessitated turning away quite a number of late applicants. It will be noted that these men came from various parts of the country as follows:

Dave Ablon, Ablon Cold Storage Co., Dallas, Texas.
Jos. J. Dannehy, Chicago, Ill.
Paul Duffey, Chicago, Ill.
Chas. E. Garrison, Flint, Mich.
Wm. C. Griesser, Pittsburgh, Pa.
Vallie N. Hale, Chillicothe, Ohio.
Cornelius D. McMonagle, Chicago, Ill.
Fred W. Pratt, Wichita Ice & Cold Storage Co., Wichita, Kans.
John F. Stone, Junius F. Stone & Co., New York, N. Y.
R. Werner, Jr., Melbourne, Australia.
Lester Bradfield, Springfield, Mass.
Bror P. Ulander, Butte, Mont.

Since the opening of the course was first announced officially, Siebel Tech has been flooded with inquiries from all over the United States and Canada for a summer course and it has therefore been decided to start another similar course Tuesday, May 2nd, 1922.

As in the case of the course at present in progress, the curriculum will be a very thorough and complete one, including such subjects as Mathematics, Physics, Chemistry, Mechanical Drawing, Mechanics of Machinery, Experimental Engineering, Mechanical Engineering, Electrical Engineering, Thermodynamic Principles, Production of Refrigeration, Refrigeration Plant Design, Plant Excursions.

The small class limit will also be again a feature, which together with the splendid faculty in charge of the course, is certain to insure maximum results for the student.

Engineers who are interested in securing further particulars about the course should not fail to put themselves in prompt touch with the registrar of Siebel Institute of Technology, 960 Montana St., Chicago, Ill.

Ice Cream With a Punch

Ice Cream Review Reporter Interviews Famous Pugilist

One of the staunchest believers in ice cream as a body-builder and strength-producer in the country is Richie Mitchell, one of the World's best known pugilists.

For the benefit of our readers, who are not conversant with present day fistic happenings, we might add that Mr. Mitchell is one of the three leading lightweight battlers of the country and the youth, who all but lifted Benny Leonard's crown in their last meeting at Madison Square Garden, New York, when he had the world's champion down for the count of nine.

Richie Mitchell

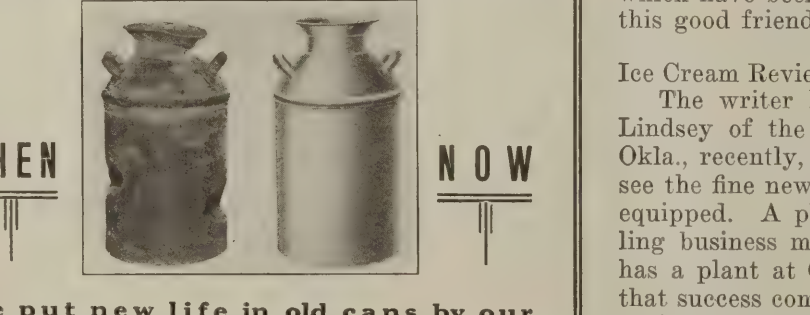
To those who never have had occasion to personally meet a modern, top-notch pugilist and who are laboring under the impression that they are in a class with toughs and bullies, as was the average prize-fighter of the olden days, would receive quite a shock upon entering the new $20,000 bungalow, the Mitchell's home, situated in Milwaukee's fashionable suburb, Shorewood, often referred to in the press as the "Gold Coast."

The writer, who was ushered into the beautifully furnished parlor by the maid, was quite surprised to find the youth who Benny Leonard admits gave him the hardest battle of the latter's career, on the floor romping with his two children, Geraldine, aged 3, and Patricia, who celebrated her first birthday last month.

As the writer's mission was on the subject of ice cream, he immediately flung this question at the boxer, who had excused himself for his mussed-up appearance, which had resulted from his "work out" with the babies.

"Mr. Mitchell, we have been informed that you are very enthusiastic regarding the virtues of ice cream as a health builder."

"I give ice cream much of the credit for my success in the ring," he replied, "and there isn't a day passes that I do not consume at least two dishes and often times more. You know in our business we have to be pretty careful what we put in our stomachs, particularly so when preparing for a fight, and ice cream is one of the few things that my trainers have not put on the 'blacklist.'



"In fact, ever since I was a kid, I have been a regular fiend for it and while the other kids were sneaking around alleys smoking cornsilk cigarettes I would be pestering my dad for a nickel to get a Sundae. He often remarks about it to this day. It was always my ambition to gather up enough of the worldly goods to purchase a whole quart and sit down and eat it all myself. Fortunately, I have had my wish.

"Both my babies have been practically brought up on ice cream, Patty wasn't hardly a month old when we caught Geraldine feeding her some of her ice cream one day—it didn't seem to hurt her either.

"If I don't bring home a brick of ice cream every night for dinner, there's 'war.' I can see Geraldine sitting in the sun parlor, for at least a block before I reach the house, anxiously waiting for her 'Ise Cream' as she calls it.

"And I doubt whether there are two healthier and stronger kids in Wisconsin than they are," he concluded, with true parental pride.

As a parting shot, he added: "You can say for me, that in my opinion, there would be fewer sickly, puny people on this earth if more ice cream was eaten."

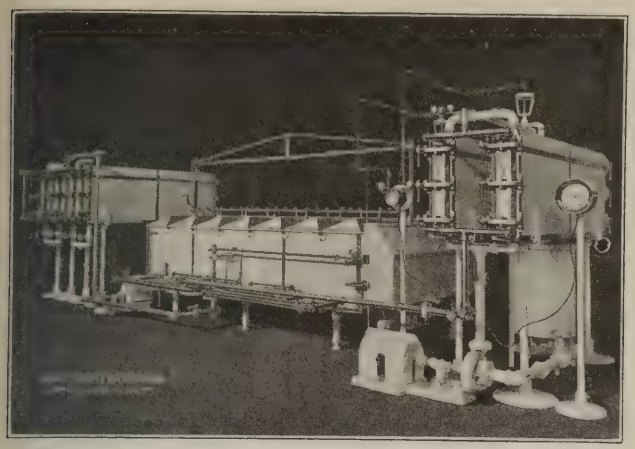
SUCCESS FOR THE HUSTLER.

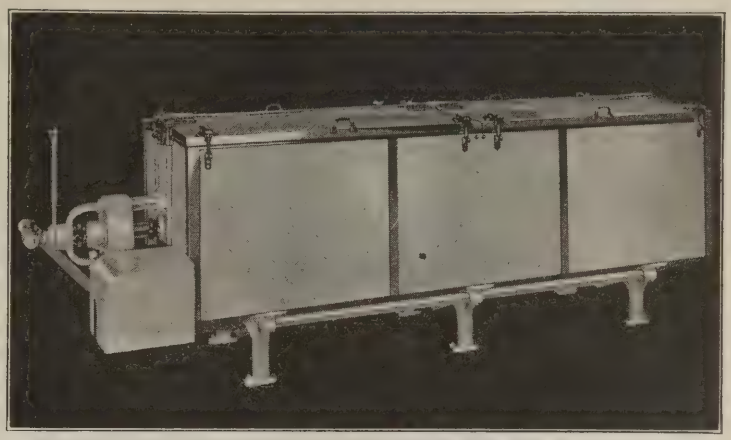
From time to time, news of the success of some hustling business man comes to us through our good friend boosters, the supply men of the great ice cream industry.

The following news comes to us from Mr. C. R. Hauk, who is now affiliated with the B. Heller & Company of Chicago, Ill., and who travels the territory out of Oklahoma City, Okla. Mr. Hauk is a staunch booster for the ice cream industry and is among the best known Wolf Hounds of Oklahoma to the readers of The Ice Cream Review through the many interesting letters which have been published in its columns, coming from this good friend.



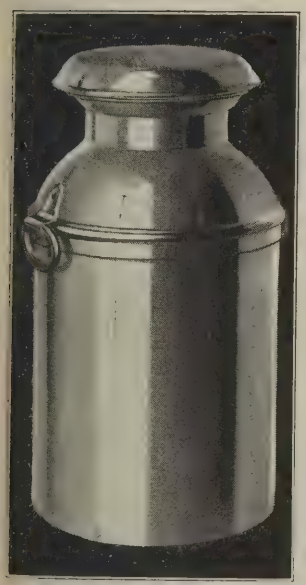
Oklahoma City, Okla.

Ice Cream Review:



The writer had the pleasure of calling on Mr. E. Lindsey of the Lindsey Ice Cream Co., of Okmulgee, Okla., recently, and was sure surprised and pleased to see the fine new plant that Mr. Lindsey has put up and equipped. A plant that this young wide awake, hustling business man can be proud of. Mr. Lindsey also has a plant at Chickasha, Okla., this all goes to prove that success comes to the hustlers who apply themselves to the task before them, in a clean sensible business manner. A credit to this great industry is Mr. Lindsey. Go to it, Mr. Lindsey, more power to you. We wish you every success in the future as in the past; hop to it old pal; all the WORLD loves a hustler; make this 1922 your banner year.

Yours with a BOOST,



C. R. HAUK.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Fairhope, Ala.—The Farmers' Co-operative Ice & Creamery Co., Fairhope, Ala., recently organized, is planning for the erection of a one story ice manufacturing plant. Leonard Payne is president.

Fairhope, Ala.—J. Caldwell will start an ice cream making establishment.

Pine Bluff, Ark.—Messrs. Laurence and Collato are planning to open an ice cream factory.

Newman, Cal.—The National Ice Cream Company is having plans prepared for a $40,000 ice cream plant of one story.

Santa Barbara, Cal.—By May 1st there will be in operation a large new ice cream plant which will supply ice cream to the vicinity around Santa Barbara. This is a $125,000 enterprise; the chief promoters are T. P. Dalzell and L. R. Philips.

Kinston, N. Car.—Harvey Hines contemplates erecting a large ice cream plant here.

Raleigh, N. C.—L. A. Corning, of the Buttercup Ice Cream Company of Hamlet now holds the controllong interest in the Pine State Creamery of Raleigh.

Charlestown, S. C.—The Ashley Ice Cream Company has been incorporated for $25,000. J. G. Sherrer, K. N. Freyschmidt and J. H. Heinsohn are interested parties concerned.

Greenwood, S. Car.—The Greenwood Ice Cream Co. has increased its capital stock to $10,000.

Spartanburg, S. C.—The Spartanburg Creamery will immediatley begin the manufacture of ice cream, milk and cream and butter.

Wilmington, Del.—The Miller Ice Cream Company has incorporated for over a million dollars.

Brighton, Ia.—Louis West, of Burlington, Ia., has now located in Brighton and is opening an ice cream factory.

Forest City, Ia.—F. R. Ballantyne, proprietor of the Forest City Ice Cream Factory, attended the short course at Ames. Mr. Ballantyne has opened his factory. The public is welcome to visit the plant at any time while they are operating.

Hamburg, Ia.—Roy Chiames of the Hamburg Candy Kitchen has purchased equipment to manufacture ice cream.

Muscatine, Ia.—Leu & Stein are erecting an ice cream factory.

Scranton, Ia.—Messrs. Coleman Bros., who are running the creamery here, report that business is good with them and that they are buying lots of cream. This firm is going to be prepared to do a land office business this season in the ice cream business, as they have just finished packing and putting away about four hundred tons of ice. Nearly every-

one learned a lesson about the ice situation last year and are getting better prepared.

Wallace, Idaho.—The Kolloge Dairy and Creamery Company will install an ice cream plant and butter factory. Arrangements are being made for the purchase of the machinery and the addition to the dairy will total an expenditure of approximately $3,000, it is stated.

Weiser, Idaho.—The Weiser Ice & Cold Storage Co. will add the manufacture of ice cream to their business the coming season, according to plans decided upon recently. The company also contemplates putting in a first class plant for handling butter, eggs, milk and cream, in addition to the manufacture of ice cream.

Chicago, Ill.—The National Ice Cream Co., 7401 W. Madison St., has been incorporated for $150,000. They will manufacture ice cream. M. Code, A. J. Versilles and E. H. Lowe are interested parties.

Chicago, Ill.—The Seven Links Ice Cream Co., 53rd and So. State St., is enlarging its plant.

Chicago, Ill.—Max Tauber & Sons are to erect what is reported to be the most complete ice and ice cream manufacturing plants in the city, at 2217-59 Wabansia avenue, with a 450 foot front and 109 feet on Oakley boulevard. The capacity is announced at 800,000 gallons of ice cream annually, 100 tons of ice daily, with ice storage space for 10,000 tons. The land is valued at $80,000 and the building to be erected there at $350,000.

Chicago, Ill.—The Big Four Artificial Ice Co., 2004 No. Keystone Ave., have capitalized at $100,000 to manufacture and deal in ice, ice cream, etc. The incorporators are Titus W. Stahsch, Alb. Ulrich, Jul. Bittmann, Henry Kronen, and Attila J. Heizer.

Rockford, Ill.—Russell Smith will be superintendent of the New Oak Brand Ice Cream Company.

Waukegan, Ill.—Plans for the $20,000 addition to the Co-operative Trading Company's dairy department at 1105 McAlister Avenue, and work on the new building will be pushed forward at once.

The new structure will be a two-story brick affair adjoining the present store of the company. All of the equipment will be the most modern obtainable. The creamery besides handling milk, will be equipped to make butter, ice cream, cheese and other dairy products.

Valparaiso, Ind.—The Vincennes Milk and Ice Cream Company has filed a petition to change its name to the Tip Top Creamery Company with the idea in mind that this name will cover all products manufactured.

Colby, Kans.—The arrangements have been completed for a new business enterprise in Colby. It is to be an ice cream factory and the management will also retail ice. It is sponsored by the Golden Belt Creamery and Ice Co., of Hays. Asa A. King is one of the officials of the company.

Manhattan, Kans.—The Chappel Ice Cream Company of Norton, Kansas, has erected a $50.000 ice plant and ice cream factory at Manhattan, and will have it open for early spring trade.

Wichita, Kans.—Amended articles of incorporation have been received from the secretary of state by the Steffen-Bretch Ice and Ice Cream Company, where the name of the corporation is changed to Steffen Ice and Ice Cream Company. C. M. Beachy is president of the company; John Olinger is secretary. The company operates ice and ice cream plants in Wichita and Oklahoma City.

Somerset, Ky.—The Danville Ice Cream Company of Danville, Ky., contemplates opening a small plant at Somerset.

Monroe, La.—The Orvin-Kent Ice Cream Co. is incorporating for $5.000. C. A. Kent, of Kentwood, La., is the president and J. H. and Mrs. W. M. Orvin, of Monroe, are secretary and treasurer, respectively.

Hagerstown, Md.—William Hankey, the well known ice cream man, has established a factory at 46½ East Franklin Street, and has instlaled a freezer capable of making 400 gallons daily.

Fitchburg, Mass.—A new plant is being built by the Ideal Ice Cream Co.

Cadillac, Mich.—The Cadillac Ice Cream Company, with plants here and at Mt. Pleasant, has been purchased by the Freeman Dairy Co., of Flint, Mich., a corporation already operating in a number of Michigan cities.

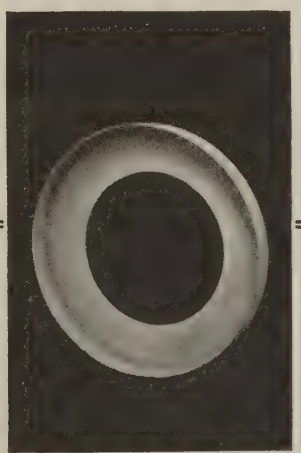
Coldwater, Mich.—Coldwater and Clark intend to begin the manufacture of ice cream about April 1st.

Flint, Mich.—Mr. Van Dyke is the new manager of the Powers Ice Cream Company. The company has changed ownership.

Cheboygan, Mich.—The Freeman Dairy Company of Flint, Mich., has purchased the Jackson Ice Cream Company here.

Lansing, Mich.—John A. Davis, veteran ice cream maker

Have Your Tubs This Protection?



When your packers are dragged along over rough concrete floors—flung around as so much junk by the express companies, and given innumerable severe bumps when unloading from trucks,—what is there to protect the bottom against the "springing" this vicious abuse sooner or later must cause?

The Roman Reinforcing Hoop Ice Cream Tub Protector is ample protection. A substantial metal rim that needs no tools to apply except those illustrated.

These Protecting Hoops have proved their worth wherever employed. They will do the same for you.

Write for circular and prices.

The B. L. Roman Mfg. Co.
608 Cherry Avenue, N. E.
Canton, Ohio

A PRETTY PACKAGE PROVIDES PLENTY OF PURCHASERS FOR YOUR PRODUCT.

of this city, and for thirty years engaged in the manufacture of ice cream, announced his plan to build an ice cream factory on land owned by him at 229 and 301 S. Cedar St. Mr. Davis hopes to be operating about the first of April providing that weather does not interfere with building plans.

The Davis factory will be 30x80 feet, and will be built of cement and brick. Mr. Davis says he will equip his plant with the most modern machinery and will make it a model of cleanliness and sanitation. He purposes to create a manufacturing capacity of 700 gallons of ice cream daily.

Menominee, Mich.—The new Dairy Products Co., the first creamery to be located in Menominee, is going to be an up to date plant, equipped with the latest machinery. The floors of the plant will be made of tile and will make it one of the most attractive creameries of the upper peninsula.

The plant is owned by the Bomber Bros. and George J. Bomber, a well known creamery man of the Twin Cities, will be manager. Mr. Bomber had years of experience in the creamery business and understands every branch of it.

They have purchased a large 100-quart brine freezer and intend making 300 to 500 gallons of the very best ice cream daily. The new 1000-pound churn and a 400 gallon pasteurizer have arrived. Two new motor trucks have also been purchased.

Petoskey, Mich.—The Petoskey Ice Cream Co. has been taken over by the Freeman Dairy Company of Flint, Mich.

Sault Sainte Marie, Mich.—The Saulte Sainte Marie Creamery Company is just completing a new plant for the manufacture of ice cream.

Ypsilanti, Mich.—The Connor Ice Cream Co. will establish a branch here.

Durant, Miss.—The Durant ice plant and creamery burned completely. A $40,000 loss was sustained.

Meridian, Miss.—Seale-Lily Ice Cream Company has purchased a building in a very choice location and will install a modern ice cream plant as soon as the building is vacated.

Hattiesburg, Miss.—The local plant of the Purity Ice Cream Company has been acquired by purchase of real estate and machinery by the Hattiesburg Produce and Creamery Company from T. L. and J. M. Pearsons, according to announcement by Hugh F. McWilliams, head of the purchasing concern. J. M. Pearson will be a stockholder and employe of the creamery.

Hattiesburg, Miss.—Mr. McWilliams, head of the Hattiesburg Creamery Company, has purchased the branch plant of the Harris Ice Cream Co., of New Orleans, La., and plans on building a modern plant on this site, in which he will handle whole milk, manufacture butter, continue the operation of his condensery and branch out into the manufacture of ice cream.

Marysville, Mo.—The Purity Ice Cream Company is contemplating the enlargement of its ice cream plant. J. Fitzgerald and Ralph and Roland von Riesen are the proprietors.

Kansas City, Mo.—The Linwood Ice Cream Company has taken over the Peerless Ice Cream Company.

Shelbina, Mo.—Floyd Tuttle and Walter Harrison are preparing to open up an ice cream plant here.

St. Louis, Mo.—The Ideal Dairy is equipping the plant for the manufacture of ice cream.

Superior, Nebr.—The Superior Ice Cream Company has installed machinery and equipment for the manufacture of ice cream.

Auburn, N. Y.—Dairymen's League ice cream is now being manufactured at the Auburn plant of the Co-operative Association. This product is made from the best quality cream and is being shipped to dealers within a radius of 100 to 150 miles from Auburn.

Brooklyn, N. Y.—The New York O. K. Ice Cream Co. has erected a new building.

Canandaigua, N. Y.—A building is being remodeled for L. W. Johncox & Co. for the purpose of an ice cream making plant.

Ransomville, N. Y.—C. Crambo has built a new $40,000 ice cream factory.

Syracuse, N. Y.—The Syracuse Ice Cream Company has now increased its capital stock to $100,000 from $50,000.

Syracuse, N. Y.—The Syracuse Ice Cream Company has increased its capital stock from $100,000 to $150,000.

Barnesville, O.—A new building, which will be used as an ice cream factory by the Damsel Ice Cream Co., is now in construction.

Canton, O.—The Noaker Ice Cream Co. has purchased the New Philadelphia Ice Cream Co. They will enlarge the plant.

Canton, O.—The Crane Ice Cream Company of Columbus has taken over the Noaker Ice Cream Co.

Cleveland, O.—The Doan Ice Cream Company will open a new plant.

Columbus, O.—More than 850 members and women guests of the Kiwanis, Lions and Optimist Clubs, were entertained by the Furnas Ice Cream Company at a dinner dance on the second floor of the Furnas Co. garage. One of the features of the dinner was corn on the cob preserved by a process originated by the company. Everett Antrim traced the growth of the Furnas Co. from 1905, up to the present. Ice cream manufactured has increased from 46,000 gallons to 425,000 gallons annually, he said.

Geneva, O.—The Geneva Creamery Company will remodel its plant.

Marietta, O.—A recent fire is estimated to have caused $25,000 damage. The Imperial Ice Cream Company, which occupies a part of the building is a heavy loser. The blaze resulted when tar being used in coating the floor and walls of a refrigerating room caught fire.

Sidney, O.—The entire stock of the Sidney Butter and Ice Cream Company has been sold to the Jackson Milk and Butter Company of Jackson Center. A new company will be incorporated under the name of the Jackson Center Cooperative Creamery Company with offices at Jackson Center. Leo Sollman will continue as manager of the new company.

Toledo, O.—The Franklin Creamery Company is starting an ice cream plant.

Anadarko, Okla.—The Washita Valley Ice Cream Company will open up an ice cream factory here soon.

Astoria, Ore.—H. R. Hoefler has sold his ice cream business to J. C. Wilson and P. L. Cover.

Eugene, Ore.—The Weatherly Ice Cream Co., of Portland, is contemplating the erection of an ice cream factory here.

Butler, Pa.—B. H. Demit, O. K. Bingham, C. E. Reed, M. A. Gibson, and C. R. Humphrey have applied for incorporation papers for a corporation to be called Slippery Rock Dairy Association. They will manufacture butter, cheese and ice cream.

Connellsville, Pa.—A Connellsville company, capitalized at $300,000, has been organized for the manufacture and distribution of the new coated ice cream confection, the sundaeette, the territorial rights to which have been secured for the states of Pennsylvania, New Jersey, West Virginia and Maryland and the District af Columbia. The board of directors is composed of H. L. Carpenter, R. D. Henry, Frank A. Tarr, C. E. Wilson, William Wishart, J. H. Richter and S. J. I. Morningstar.

Dorranceton, Pa.—The Fadden Ice Cream Company is erecting a plant to cost $200,000 and to be completed by April 1.

Hazelton, Pa.—The Leichtman Ice Cream Company has increased its capital stock to $150,000.

Perkasie, Pa.—At a meeting of the board of directors of the Crescent Ice Cream Company, at Perkasie, at which I. P. Mensch was unanimously re-elected president, it was announced that the capital stock of the concern had beei increased from $50,000 to $150,000 and that extensive additions will be made to the present plant.

Plans have been received and approved for a three story brick and steel addition that will house an ice manufacturing plant of a capacity of 30 tons daily and provide storage facilities for 500 tons.

Philadelphia, Pa.—The Breyer Ice Cream Co. is erecting a four-story building to cost $50,000. This will be used in addition to the present plant of the firm.

St. Marys, Pa.—James G. Shaffer, formerly with the Nelson Ice Cream Co., of Portage, has moved to St. Marys where he will establish himself in the ice cream business.

Tarentum, Pa.—A corporation, to be called the Ganoe Ice, Ice Cream and Dairy Company, will be in operation in the near future. W. G. Ganoe, F. P. Kennedy and M. J. Ganoe are interested parties.

Titusville, Pa.—Wilbut D. Metcalf and Ralph M. Kerr now control seven-eighths of the stock of the Titusville Butter and Ice Cream Company. At the annual meeting Harry Cassedy was elected president; Ralph M. Kerr, vice-president; and Wilbur D. Metcalf, secretary and treasurer and general manager. The reorganized company is contemplating numerous improvements and the erection of an addition to the main building.

Washington, Pa.—The Imperial Ice Cream Co., with general offices at Clarksburg, W. Va., has purchased from A. L. Paul & Son, the White Dairy Ice Cream Co. plant on Chartlers street. Possession has been taken, and this company will now manufacture ice cream here. The Imperial Ice Cream Company operates in four different states, has a number of plants, and is at present erecting four new plants.

York, Pa.—P. M. Bupp expects to have his new ice cream plant completed by April 1st.

Big Spring, Tex.—An addition 20x50 feet is being built to

the Big Spring ice cream factory. Robert Boatle, the owner, is installing new machinery for bottling works.

Nashville, Tenn.—The Union Ice Cream Co. is erecting a new plant here.

Mt. Worth, Tex.—The Perfection Ice Cream Company is closing and selling all machinery.

Cleburne, Tex.—S. H. Starling and Miss Glatzert of the M. B. Ice Cream Company, of Waco, have bought the Seeley Ice Cream plant at public auction, and have taken possession of same. They are installing machinery.

Cleburne, Texas.—The Seely Ice Cream Factory has been sold to S. H. Staling and Miss Glatzert of Waco. They will install new fixtures and add more machinery to the plant.

Corpus Christi, Tex.—Ground has been broken for the new concrete building which will be occupied by the Cloverdale Ice Cream Company's creamery department. Plans call for large cold storage department. Sanitation will be made easy by the installation of concrete floors. The building is to cost $20,000. Equipment, modern in every detail, will be installed. The plant is to be in operation by April 1, it was announced.

Corsicana, Tex.—The Frick Ice Cream Company is making preparations to meet their growing business for the coming season. The contract has been let for the immediate erection of an addition to their plant, the size of which will be 45 feet.

Lampasas, Tex.—L. H. Rutledge contemplates erecting an ice cream factory.

Marysville, Tenn.—The Chapin-Sacks Corporation of Washington, D. C., will begin operation of their new plant here about May 1st.

Sherman, Tex.—The Lyon Farm Creamery Company and the Jenson-Erkee Ice Cream Company have consolidated and are discontinuing the Lyon Farm plant to open a branch in Denison in its place.

Yoakum, Tex.—Louis Pleeger, owner of the Pleeger Bottling Works, of this city, is having installed a modern ice cream plant, which will be conducted under the same management as his bottling works.

Richmond, Va.—The Abel Velvet Ice Cream Company has capitalized for $5,000. C. J. Schuh, E. J. Leen and C. W. Abel are interested parties.

Richmond, Va.—The Horn Ice Cream Company, of Baltimore, Md., is erecting a factory and installing equipment to cost approximately $500,000.

Richmond, Va.—The Horn Ice Cream Company is erecting a new plant. The company also operates a large plant in Baltimore.

Fairmont, W. Va.—The Diamond Ice Cream Co., has incorporated for $50,000. E. C. Frame, H. T. Sharp, J. W. Preston, Carl Riggs, and B. W. McClure are interested parties.

Fairmont, W. Va.—The Fairmont Ice Company will manufacture ice cream, beginning in spring.

Fairmont, W. Va.—The Imperial Ice Cream Co. has purchased the business of the Robinson Ice Cream Co.

Fairmont, W. Va.—A charter was granted to the Diamond Ice Cream Company of this city. The authorized capitalization of the company is $50,000. The incorporators are E. C. Frame, H. T. Sharp, J. W. Preston, Carl Riggs and B. W. McClure, all of Fairmont.

Morgantown, W. Va.—The Morgantown Ice Company has obtained a permit from the city council for the construction of a large ice cream manufacturing plant on Third street.

Morgantown, W. Va.—R. A. Wilbourne Company will build an addition to its ice cream plant which is to cost approximately $55,000.

Appleton, Wis.—Karl B. Mory, of the Mory Ice Cream Company, and George Mory, of the company's Stevens Point branch, attended the seventh annual convention of the Wisconsin Association of Ice Cream Manufacturers in Milwaukee.

Berlin, Wis.—Prospects for starting up business by the middle of February in their new quarters seemed bright when the stockholders of the Berlin Ice Cream and Dairy Products Company held their first annual meeting. Between thirty and forty stockholders attended the meeting and heard the reports. The directors of the company, who are also the officers are: President, Fred R. Scobie; vice-president, W. E. Cavanaugh; secretary, Nic Muckerheid; treasurer, Jos. Dolliver; manager, Geo. Bobzin.

Janesville, Wis.—The Shurtleff Ice Cream Company has postponed the new $65,000 addition to its plant which was contemplated last fall. The addition will be erected next year.

Madison, Wis.—An $80,000, two story building will be erected by the Kennedy Dairy Co., 618 University Ave., and will be used to handle milk and for the manufacture of ice cream.

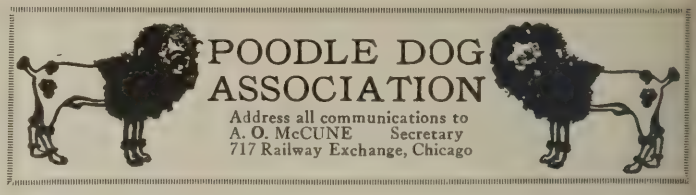
J. G. HAMMERSCHLAG, ***Wisconsin Manager***

1016 Majestic Building Milwaukee, Wisconsin



Our aim has always been to produce Tubs and Cabinets that would stand up under any and all circumstances

THAT we have succeeded has been demonstrated by our steadily increasing business and the fact that we are, and have for many years, enjoyed the exclusive business of many leading firms throughout the United States. In all these years that these products have been identified with, our leadership has never seriously been challenged.

WE HAVE been engaged in the cooperage business since 1877—Our experience has dealt with this industry in every phase—tubs—tanks—barrels—casks, and in recent years ice cream tubs and cabinets. After carefully studying all the tubs and cabinets being sold today and by this investigation and experiments by expert engineers, we are now offering perfected products that are second to none in the world.

Among the many words of appreciation sent us in expression of pleasure derived from reading the January issue of The Ice Cream Review, comes a few from a brother Poodle Dog—F. Rose—who is a representative of the Swift & Co. Gelatine Department. Mr. Rose writes:

Ft. Dodge, Ia.

Olsen Publishing Company: Just want to say your January issue of The Ice Cream Review was a knockout. I am already feeling like a brother of the family circle. Have had several customers and prospective ones identify me, upon entrance to their place of business. Can say that your so-called art gallery has helped me, as well as the other brother peddlars, to become closer acquainted with the ice cream manufacturers.

F. ROSE.

* * *

TO THOSE MANUFACTURING OR DISTRIBUTING ANY PRODUCT USED IN THE MANUFACTURE OR DISTRIBUTION OF ICE CREAM.

A salesman values his personal acquaintance or friendship with his customers most highly. If you are selling a product used in the manufacture or distribution of ice cream, can you think of any place where your salesmen can meet their Iowa trade to better advantage than at the annual convention of the Association of Ice Cream Manufacturers of Iowa?

At conventions supply men usually spend some money in entertaining their trade. The Poodle Dog Association was organized several years ago with the idea that each attending supply man should contribute an equal amount of money in that direction and the total amount spent for intelligent entertainment. Each year we have charge of all entertainment at the Ice Cream Manufacturers' annual banquet. We think that our efforts are appreciated by all of the attending manufacturers and that many of them place orders with our members because of this entertainment, or because of an acquaintance or friendship formulated at the convention.

Whenever occasion arises we write letters to the Ice Cream Manufacturers. Below is a copy of one sent Feb. 21st. You will note that the names of your salesmen and their connection appears on the back of the letter.

We hope that this little organization meets with your approval and you will be well represented at the annual convention of the Association of Ice Cream Manufacturers of Iowa at Des Moines in January, 1923.

A. O. McCUNE, Secretary.

* * *

To the Ice Cream Manufacturers of Iowa:

May we take this opportunity to thank you for courtesies extended at the annual convention of Association of Ice Cream Manufacturers of Iowa at Cedar Rapids, January 24th and 25th, 1922. It is the object of the Poodle Dog Association to co-operate with you to make your conventions most enjoyable and we trust that our efforts meet with your approval.

The 1922 ice cream season is almost upon us and we are all looking forward to a big business. Conditions

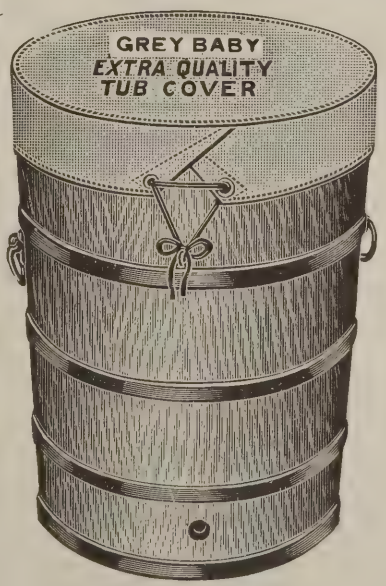
IMPERIAL ICE CREAM COMPANY SUFFERS FIRE.



The Imperial Ice Cream Company of Clarksburg, W. Va., suffered a fire loss recently at their Marietta, Ohio, plant.

The damage to the building and plant was in the neighborhood of $30,000 and luckily is fully covered by insurance. Fortunately the money loss was small, but the inconvenience and delay of erecting a new plant will work some hardship with the company. Building operations have already been started and some of the material is now in transit.

The fire started in a peculiar way—the cork contractor has just finished the hardening room and carried in the last bucketful of hot asphalt needed. There was a little material in the kettle and he decided to throw that in for good measure. The kettle was hot and the top of it touched the asphalt which ignited, causing the damage.

W. M. B. Sine is general manager.

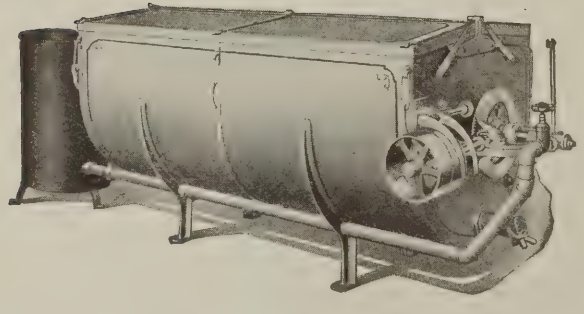
ST. LOUIS, MISSOURI

Why Is A Barrel Round?

If you know why a barrel is stronger than a box then you know why the Manning Batch Mixer with its well built, round body is stronger than any square built vat.



More sanitary, too, for there are no corners —just a single smooth surface that is easy to clean.

The Manning coil follows the natural lines of the vat and gives a more thorough agitation and consequently a more even temperature distribution.

OHIO CONVENTION.

By C. J. Yunker.

Mr. R. E. Everett, secretary, and Mr. T. J. Stewart, president of the Association of Ice Cream Supply Men's Club of New York City, attended the Ohio Ice Cream Manufacturers' convention at Columbus, O.

Among the firms represented at the Ohio convention were:

Mansfield Pure Milk Co., Mansfield, O.
Dickson Creamery Co., Mansfield, O.
Dairy Products Co., Bucyrus, O.
White Mountain Dairy Co., Lima, O.
The Ohio Toledo Ice Cream Co., Toledo, O.
Isaly Dairy Co., Youngstown, O.
J. V. Mast Creamery Co., Newark, O.
Licking County Creamery Co., Newark, O.
Isaly Dairy Co., Marion, O.
Bryan Ice Cream Co., Bryan, O.
D. A. Heckler Ice Cream Co., Napoleon, O.
Furnas Ice Cream Co., Akron, O.
Heaton Ice Cream Co., Urichsville, O.
Glauser Ice Cream Co., New Philadelphia, O.
Chillicothe Bottling & Ice Cream Co., Portsmouth, O.
Seamon Ice Cream Co., Lexington, O.
Esmond Dairy Co., Sandusky, O.
Noaker Ice Cream Co., Canton, O.
Harrison Ice Cream Co., Kenton, O.
Glen Preston, Urichsville, O.
J. Smith, Dennison, O.
Telling Ice Cream Co., Columbus, O.
Moore Ross Milk Co., Columbus, O.

Crane Ohio Ice Cream Co., Columbus, O., and its different branches.

Furnas Ice Cream Co., Columbus, O.
Gibson Ice Cream Co., Oberlin, O.
Smith Bros. Ice Cream Co., Orville, O.
Telling Ice Cream Co., Cleveland, O.
Furnas Ice Cream Co., Akron, O.
Gem City Ice Cream Co., Dayton, O.
Springfield Pure Milk Products Co., Springfield, O.
Monti Ice Cream Co., Marion, O.
Sanitary Milk Co., Canton, O.

* * *

SONGS SUNG AT THE ANNUAL BANQUET.

Written and Led by L. V. Busche, Canton, Ohio, Who Is an "Ice Cream Eater."

1. "CONVENTION PALS."

Tune—Beautiful Ohio.

Chumming with my pals in this convention's work,
Planning with them, working with them, not a shirk,
While the stars on high, twinkle in the sky,
Tenderly we'll labor and with love sublime,
Beaming with a radiance from a work divine
This convention's good pals are a privilege to me,
Dear old Pals, how I love thee.

2. "CREAMS."

Tune—Smiles.

There are "creams" that make us happy,
There are "cones" that make us blue,
There is "ice" that "freezes" all the tear drops,
There is "salt" to keep it from the dew,
There are "solids" that have a tender meaning,
"Butterfats" at "eight per cent," you see?
But the "cream" that fills my heart with sunshine
Is "Eskimo Pie" that they buy from me.

FOR OVER 20 YEARS

We guarantee to improve your Flavor with a saving in cost

Proprietors of "VANOLEUM." The *Original Concentrated Vanilla Flavor.* We warn the trade against worthless imitations having similar sounding names claiming to be "the same as *Vanoleum.*"

MEMBER

Corrizo Extract Company

211-215 West 20th Street **NEW YORK, N. Y.**

4. "THE QUESTION."

Tune—Long, Long Trail.

There's a great big burning question
In every "ice cream man's" heart:
Will he join the association,
Or will he stand apart?
We will gladly give our service
You need us, and we, need you,
And we'll show our worthy patrons
What the "Ice Cream Makers" can do.

5. TITLE—"ORDERS."

Tune—"Bubbles."
Place—"Office and Plant."
Time—"In the good old summer time."

We're forever filling orders,
Orders come from everywhere;
They pile so high, nearly reach the sky,
Then when it's hot—Oh me—Oh, my!
"Your oder's on the truck, sir,"
"It will soon be there."
Gee! It's fun to fill the orders,
"Rush" the orders here and there.

6. "OUR OWN."

Tune—Auld Lang Syne.

Should "Ross," our President, be forgot
And overlooked by us?
You bet your bottom dollar, not,
The energetic cuss.
Then there is "Antrim," he's the Vice,
"Cline and Schmidt," the Treasurer,
They're hustlers, all of them, you bet,
Our thanks we now confer.

CHORUS.

Now, listen, boys, 'twill never do—
There's one we know quite well,
He's on the "Secretary's job"
And his name is "Art Burkell."

(Concluded on page 102, second column)

You Need It In Your Business

If you have never used a Smith's Butterfat Computer you can't imagine what a big help it is. All drudgery of figuring and checking done away with.

In buying all kinds of farm produce it is indispensable to the man who has used it.

Just Turn Over a Page and There's the Answer.

It's the correct answer, too. We want you to have one. Send us $2.00 and we will put one in the mails for you at once, postage prepaid. Your money back any time within 10 days if you don't like it. Address:

THE OLSEN PUBLISHING CO.

210 Sycamore St. **Milwaukee, Wis.**

Experts Needed in the Ice Cream Industry

Address of E. K. SLATER before Michigan Association of Ice Cream Manufacturers

AMONG other punishments which I have endured is that of sitting in a convention and listening to a paper prepared by some fellow who couldn't raise the necessary expense money to attend the convention. It's bad enough when the writer of the paper reads it himself, but when a second man reads it, it is an "abomination in the sight of the Lord."

This is the first time I have ever perpetrated this crime, and I do so just to keep a promise made to your secretary that I would at least contribute an "editorial" if I couldn't raise the necessary funds to attend your convention.

I have attended so many Michigan dairy conventions, and had such good times, that I regret exceedingly that I can't be there. So much in the way of an apology for what follows:

"Are you an expert in your business?" May the Lord help you if you are not, or at least making progress in becoming an expert. Men in business who do not make a study of their particular business, so as to become expert in it, are all headed in the same direction, and when their obituaries are written their loving friends will lightly pass over their records as business men.

Webster gives as one of his definitions of an expert," "**one instructed by experience.**" Possibly ice cream manufacturers should all be considered experts in the light of this definition. They get a lot of experience crowded into a short period, but the trouble is, many of them learn a lot that isn't so. Experience is an efficient teacher, but not always a reliable teacher. To learn to do a thing wrong is worse than not learning to do it at all.

The ice cream business is a comparatively new business, consequently it is not to be wondered at that inefficiency is rampant. The demand for expert ice cream information has exceeded the supply for several years. Many ice cream makers are "second hand" or "made over" men from other lines of business. A man goes to bed at night a creamery buttermaker and gets up in the morning an ice cream maker because the proprietor has decided to manufacture ice cream. The product he puts out is "ice cream," and it's "ice cream" regardless of quality. So long as the man who makes it can mix a lot of ingredients together and freeze them he is an ice cream maker, and there is no one to challenge him.

The ambition to become an expert ice cream maker is a laudable one. There was a time when the seeker after knowledge along this line had to work out his own problems and to let experience be his teacher, but now ice cream making is an established science. There is an abundance of expert information available to the man who wants to learn.

We need more expert ice cream makers in our factories. More men are needed who do not know all there is to know about the business. Too many makers are satisfying themselves instead of satisfying the folks who buy their product.

So much for the man who actually makes the ice cream in the factories. Experts in the management of these factories are needed quite as much. In fact, the expert manager will soon have an expert maker in the factory one way or another. As a rule the ice cream factory that is turning out good, uniform ice cream is in the hands of a **bunch** of experts.

Men who know their business are, as a rule, successful in business if they work hard enough. Expert knowledge cannot successfully supplant hard work in conducting an ice cream business but the two qualities in the same person can work wonders.

Men who attend conventions are either experts in their business or are on the road to becoming experts. Thirsting for information is the best sign that can possibly appear to distinguish the expert from the commonplace man in the business. Becoming an expert simply means striving to the utmost to attain efficiency. There is a danger, however, in being accepted as an expert. It's all right for other folks to take you seriously but it is dangerous to accept yourself as an expert.

Custom permits various kinds of experts, and accepts their testimony as authoritative except when they appear before juries. There are expert doctors, expert chemists, and this, that and the other thing. The term is almost in disrepute as applied to many of life's activities. It isn't that kind of expert knowledge that I would urge upon ice cream manufacturers. Being an expert in your business means being efficient in your business—at least that is the construction I am placing upon it.

We need more experts of this kind. We need greater efficiency in the ice cream business—more men who recognize that quality and service are the foundation stones upon which the superstructure of the industry must rest if it is to develop and endure as we would have it do.

None of us needs to look far to find where and how we can serve the industry. We can serve it in no better way than to make every effort to become expert in the work in which we are engaged—to do it just a little bit better than any other man in the world could do the particular job we are doing.

The ice cream business needs more men who are experts in doing things well. The world needs more such men.

OHIO CONVENTION.

(Concluded from Page 101)

We are a bunch that's hard to beat,
And we never, never fail;
We are not the old cow's tail.

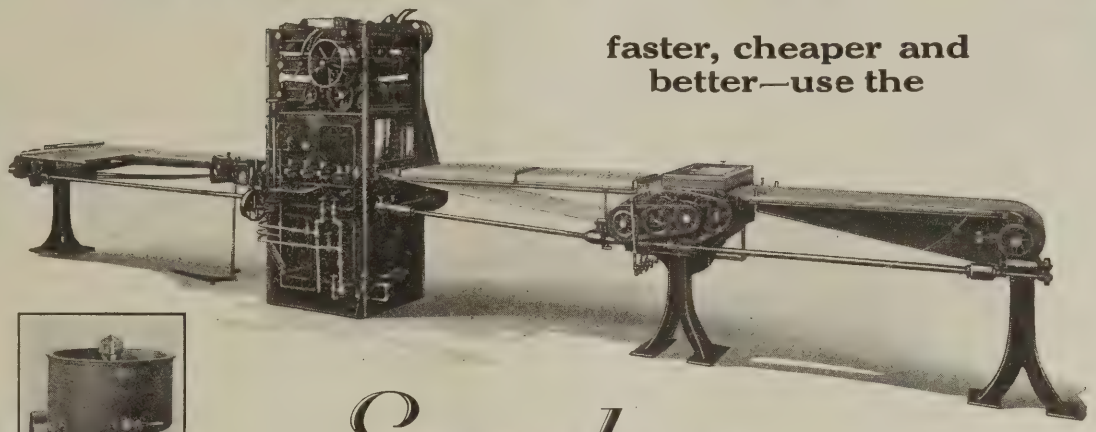
CHORUS—Faster.

Old Kaiser Bill went up the hill
To take a look at France.
Old Kaiser Bill chased down the hill
WITH BULLETS IN HIS PANTS.

7. "BUSCHE'S FAREWELL."

Tune—'Til We Meet Again.

Smile the while we bid you all adieu,
And sometime we'll meet again with you.
May good luck be yours 'til then,
We'll be better "Ice Cream" men
For having met you in convention here,
And your friendship, we will hold most dear,
So, we'll say, good luck, farewell,
"Till we meet again."



"THE ICE CREAM GANG."

Tune—Harry Lauder's "Oh, It's Great to Get Up In the Mornin'"

Oh, it's great to belong to the "ice cream gang"
And serve your fellow man.
He profits best who serves the most
Ice cream in a nice clean can.
Around the world it's going,
We're never, never slow.
Oh, It's great to get up in the mornin', boys,
And find you're an "ESKIMO."

PROCEEDINGS OF ANNUAL MEETING.

General meeting at Auditorium, Saginaw, Feb. 15, called by President Ellwanger.

Well attended. All officers and directors present.

Reading of previous meeting and reports ordered dispensed with by motion on vote. Discussion as to reorganization for coming year. Lack of information as to what action Allied Association would take called for motion made and seconded and voted affirmative the committee of three be appointed to confer with Allied Association and report at 10:30 tomorrow.

Committee as appointed—Henry Stern, W. E. Stewart, O. E. Harwood.

Vote of thanks given to Mr. C. J. Yuncker for his Booster spirit and activities in behalf of the association during past year.

Vote of thanks also given Olsen Publishing Company, of Milwaukee, Wisconsin, for the very liberal space donations to boost Michigan Show, etc.

This and other resolutions and votes of thanks referred to Resolutions Committee consisting of Howard Black, C. J. Yuncker, J. B. Hill, to report at meeting the following day with resolutions drawn up for action.

Secretary-Treasurer requested Auditing Committee be appointed to audit books and report at February 16th meeting.

Committee—H. W. Stern, C. A. Beigle.

Meeting closed with very interesting talk by Henry B. Stevens on Salesmen's Manner.

C. J. W. SMITH, Sec'y-Treas.

* * *

General meeting at Auditorium, Saginaw, February 16th, called to order by President R. J. Ellwanger.

Good general attendance and all officers present.

Auditing Committee reported Secretary-Treasurer books have been examined and found correct.

Resolution Committee read several resolutions which were adopted and which were ordered spread on minutes and copies sent to all interested. Committee agreeing to attend to this.

Committee to confer with Allied Association had no report as Allied Association had taken no action on which to base report.

Discussions on stand Boosters would take for ensuing year resulted in motion to withdraw from actual affiliation with Allied Association, with amendments to make Boosters dues $10 per year. Also that officers of Boosters act and confer with Allied Association directors and take what action they deemed best for ensuing year as to policy.

Election of Officers.

Decided by acclamation, Secretary casing ballot, resulted as follows: C. J. Yuncker, 1112 Radcliffe Road, Toledo, Ohio, president; Howard D. Black, Cleveland, Ohio, vice president; C. J. W. Smith, 561 Continental Avenue, Detroit, Mich., secretary-treasurer; John Keating, 16 W. Buckley Street S. W., Grand Rapids, Mich., and D. W. Shiel, Hillsdale, Mich., directors.

The Allied Association reported election of R. J. Ellwanger as third member on Allied Board of Directors.

A vote of thanks given to retiring board for work done during past year.

Registration cards were distributed for filling out and returning to secretary.

Meeting adjourned.

C. J. W. SMITH, Sec'y-Treas.

Constitution.

Article 1. Name.

This organization shall be known as "The Michigan Dairy Boosters."

Article 2. Objects.

To promote the welfare of the Dairy Industry of Michigan. Good fellowship among its members and to co-operate with the Michigan Allied Dairy Association.

Article 3. Memberships.

Section 1. Accredited salesmen and sales managers of firms or corporations, members in good standing of the Michigan Allied Dairy Association shall be eligible to membership.

Sec. 2. The annual dues shall be $10.00 per year for each firm or corporation represented.

Article 4. Officers.

Section 1. Officers shall be: President, Vice President, Secretary-Treasurer, two directors, to be elected at each annual meeting. Such officers shall be called the Board of Directors and shall continue to hold office until their successors are duly elected.

The office of Secretary and Treasurer may be held by the same person.

Sec. 2. The government of this body shall be vested in said Board of Directors.

Sec. 3. The meetings of the Board of Directors may be called by the president at any time, and the president may at any time lay propositions by mail before the board of directors, individually, for action by majority vote.

Sec. 4. The duties of each officer shall be those customarily attendant upon the bearers of such titles.

The Secretary-Treasurer shall have custody of all money collected, defray expenses, and shall keep proper records and duly account for same.

Article 5. Annual Meeting.

The time and place shall coincide with the time and place of the annual meeting of the Michigan Allied Dairy Association.

Article 6. Expulsions.

Section 1. The commission by any member, of an act which discredits or otherwise injures this body, shall be cause for the expulsion of such member by the Board of Directors.

Sec. 2. A member charged with the commission of an act, or acts, which if proved, would warrant his expulsion, shall be duly notified in writing of the charge or charges against him, and he shall be given a fair opportunity to be heard at a meeting of the Board of Directors; or, to submit his defense in writing if he so elects.

Sec. 3. To expel a member, a majority vote of the Board of Directors shall be necessary.

Article 7. Vacancies.

Should a vacancy occur by reason of death or resignation of a member of the Board of Directors the vacancy shall be filled by the majority vote of the remaining members of the Board of Directors.

Article 8. The Fair Practices Code.

This code adopted by the Association of Ice Cream Supply Men shall be a part of this constitution and a copy of same shall be attached thereto.

Article 9. Amendments.

Amendments to the constitution or by-laws of this body may be made at any annual meeting and adopted by a two-thirds vote of those present.

By-Laws.

Article 1.

Section 1. No firm represented shall have more than one vote.

Sec. 2. Any member may be authorized to vote as proxy for any other member or members.

Sec. 3. Any member may demand a roll call on any vote.

Sec. 4. The reports of officers, directors and all committees shall be written reports.

Article 2. Order of Business.

For all meetings shall be:

1. Call of roll.
2. Reading of minutes of previous meeting.
3. Report of officers.
4. Report of committees.
5. Unfinished business.
6. New business.

Secretary-Treasurer's Financial Report to Feb. 1, 1922.

Receipts	$444.02
Expenditures	216.12
Cash on hand, Feb. 21, 1922	$227.90

* * *

There surely must be something in the name, "The Michigan Dairy Boosters," which was chosen by the supplymen in Michigan as the name of their organization. Judging from the number of exhibits at the Saginaw convention, they surely are boosters. The interest and optimism displayed by individual members augurs well for the business of today and for the future.

A spirit of goodfellowship prevailed at the business meetings and at the banquet and smoker. It surely must be very gratifying to the officers and committees to have their work so well rewarded, and it goes to show that the right spirit of co-operation can put on a good show and convention. The machinery and supply exhibits put Michigan on the map, and she is there to stay. Plans are in order for still greater exhibits in 1923.

One of the features which caused much favorable comment during the show was the closing of the exhibit hall while different associations held their meetings. These meetings were held two hours in the morning and two hours in the afternoon. The exhibit hall was open the rest of the time, and then the dairymen and dairy supply men made good use of the time. The supply men gladly co-operated in this plan, and joined in the meetings of the different associations. This created friendliness, and the salesman had a much better chance of getting acquainted with his trade.

The first meeting of the Boosters was held Tuesday morning while other associations were in session. President Ellwanger called the meeting to order, and said some very nice things about the show. The boys then unburdened themselves of some toasts to their favorite trade paper as follows:

"Here's to the Ice Cream Review,
We wish much luck to you.
We wish you wealth,
We wish you success;
What more could we wish to you?"

And another:

"Here's long life to the Ice Cream Review,
With all its freaks and capers,
And without our pictures once in a while,
What would become of the ice cream papers?"

BY THE MICHIGAN DAIRY BOOSTERS.

To these must be added one that came to us by mail, and credited to the Michigan Allied Dairy Association:

Here's to those who like The Ice Cream Review,
And here's to those who don't.
A smile for those who are willing to,
And a tear for those who won't.

BY THE MICHIGAN ALLIED DAIRY ASS'N.

Then, after the dust had settled, several announcements were made in regard to the different meetings and the banquet, followed by a short talk by Mr. C. J. Yunker of the Rex Extract Company of New York. Here it is:

"Mr. President and Gentlemen: We are all proud of this convention and the exhibits displayed. I hope that next year we will all unite again in helping to make it even larger and better than this year. I trust we will all leave this floor satisfied with the results we have had here and that from today on, you will all boost the Michigan Dairy Boosters' organization. Remember that we should all help each other and work hand in hand to get good results, and always remember that we have adopted as many of the by-laws as we could, of the organization of the Association of Ice Cream Supply Men's Salesmen's Club of New York and also their Fair Practice Code, which, if followed, will bring us closer together, and we will get results for our firms as well as ourselves.

I trust that you will enjoy the smoker given by the Michigan Dairy Boosters. The entertainment committee has worked hard to try to please you and we trust that you will all have a good time, and all those attending will go home well satisfied and tell their friends how the traveling men entertained them at this convention. I hope it will mean closer friendship among the traveling men and their customers.

I want to thank you Michigan Boosters for your photos sent me upon request, for The Ice Cream Review. I trust you are all pleased with the January issue, boosting this convention. I am only sorry that we did not have the photo of each and every man belonging to the Michigan Dairy Boosters, then it would have been 100 per cent. I did my part in getting them, in order to boost this show, but some did not answer my letters in regard to these photos.

We should extend our thanks to The Ice Cream Review for their good will and the advertising and boosting which they gave us, and in return to them, and I think we can all derive many benefits from The Review, we should all subscribe for it. I know I have several times found "tips" in The Review which were to my advantage, and no doubt you can find the same. The price of a subscription would not break us. Quite a number of salesmen are now taking it, but let's make it 100 per cent strong and all take it.

We also give our thanks to Fred Hollweg of the

Thos. W. Dunn Co., of New York City, for his entertainment at the piano.

I will now close this little talk to you, hoping we will all meet again at the next Michigan convention.

Matters of business were then transacted, and the nominating committee and the resolution committee were appointed.

In the forenoon of the second day the Boosters held their second meeting. After a few items of business were taken up the resolution committee was called upon and asked to give its report. The only resolution presented was as follows:

"Whereas, the Michigan Dairy Boosters realize the efforts put forth by The Ice Cream Review in advertising this show, in furnishing song sheets for the banquet, and

"Whereas, Mr. Olsen and his staff have always labored in the interests of the Supply Men, and in the interests of the Ice Cream and Dairy Industry, therefore

"Be it Resolved, That the Michigan Dairy Boosters extend a unanimous vote of thanks to Mr. Olsen and to his entire staff and send our best wishes for their success."

(Signed)

H. W. BLACK,
C. J. YUNCKER,
J. B. HILL,

Resolution Committee.

Then the nominating committee was called on to give its report, and officers were unanimously elected as follows:

President—C. J. Yuncker, Toledo, Ohio, The Rex Extract Company.

Vice-President—H. W. Black, Cleveland, Ohio, The Widlar Company.

Secretary and Treasurer—C. J. Smith, Detroit, Mich., The Creamery Package Manufacturing Co.

Directors—D. W. Theil, Hillsdale, Mich., Solar-Sturgis Manufacturing Co.; John Keating, Grand Rapids, Mich., A. H. Arnold & Bro.; R. J. Ellwanger, Grand Rapids, Mich., John W. Ladd Co.

* * *

THE SMOKER.

During the last evening of the convention the Michigan Allied Dairy Association members were the guests of the Michigan Dairy Boosters at a smoker. The entertainment committee is to be congratulated on the very fine program they arranged. During the entertainment the newly elected officers of the Boosters' Association were presented to the audience so that everyone had a good chance to see the good looking bunch of fellows who are going to lead the Boosters this year. President Yuncker surely made a hit, while his associate officers were crowding him all the time in the race for honors.

Then John W. Ladd was called upon and got the whole bunch enthusiastic and ready to boost for the next Michigan show wherever it is held. A number of other speakers were called on after which "Billie" Burke, a well known stage star, entertained the boys with some of his famous stories and wit.

The main part of the program was the minstrel show featuring the Mueller Brothers Trio, who entertained with songs and jokes.

After the program was completed the bar was opened, and hard cider and fresh doughnuts were served. The bunch then got together, indulged in singing, wished each other good luck, and hoped that they would all, be together again in '23.

The "Boosters" kept The Review folks blushing all the time and we deeply appreciate the many expressions of good will offered. It will make us try harder than ever to merit their confidence and support.

* * *

NOTES OF THE CONVENTION.

By C. J. Yuncker.

The Michigan Dairy Boosters, an organization composed of supply men, gave a smoker and minstrel show, with good story tellers, plenty of speakers, lots of cigars and cigarettes, a five-round boxing match, and plenty of cider and doughnuts. The attendance was large, and everyone was feeling happy.

The Michigan convention was better and bigger in every way than ever before. Everyone was happy, and selling was good. It was the greatest thing ever put over by any one state, and next year it will be still bigger and better. Exhibits were very fine and plentiful, and almost everything pertaining to the business of machinery and supplies was shown there.

Fred Hollweg, of the Thos. W. Dunn Co., New York, attended the convention, and put every one in good spirits by his piano playing. He has made lots of friends in Michigan, and cannot afford to miss coming next year. Many thanks, Fred.

Jerome E. Long, 4700 North Artesian Avenue, Chicago, Illinois, is now representing the Hughes Gelatine Company, Detroit, Michigan. He seems to be a hustler, and we wish him success.

Who said we could not give a big show at the Michigan Allied Dairy convention? Leave it to the Michigan Dairy Boosters—they all work hand in hand, and this show proves it. Now let's all get together and prepare for the 1923 show.

The banquet at the Saginaw convention was attended by about 400 persons. A good toastmaster, some good speakers, good singers, a fine vaudeville show, dancing to the strains of fine orchestra music, and plenty of songs were in evidence at this enjoyable affair.

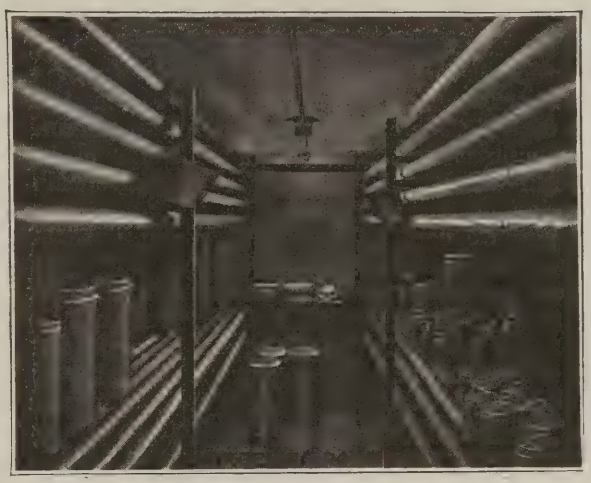
The Wilson Ice Cream Company, Port Huron, Mich., has installed a new ten-ton ice plant, with a hardening room capacity of 7,000 gallons.

The Alpha Creamery, Muskegon, Michigan, has built a new tile building at 148 Otto Street for their business. It is a one-story structure, 38x72 feet. This form is coming right to the front. They own several other creameries in different localities.

* * *

WILL WORK AND WORRY AGE A MAN?

Editor The Ice Cream Review: I have lived in Michigan all my life and along about the first part of January rumors of a dairy convention to be held at Saginaw reached our farm. We didn't pay much attention to these rumors until the rural carrier left an Ice Cream Review in our box by mistake. We found this magazine chuck full of boosts for the Michigan Allied Dairy Show, and also pictures which appeared to be, or which were claimed to be, photographs of some very fine looking young men, and the "Review" claimed that these men would all be at the convention.



Right at the top of page 44, in the upper left-hand corner was the portrait of a very keen looking man appearing to be about 30. Well, 30 was a little old for me, so I passed Mr. Ellwanger by and spent a few minutes studying the portrait of C. J. W. Smith, but finally decided that he was too much of a heavyweight to suit

MICHIGAN CONVENTION AND SHOW BIG SUCCESS.

(Continued from page 16)

The American dollar seems to be rapidly getting bigger, and just now the injustice is in too low prices for farm commodities, and the lack of employment for thousands who really want to work, the last is, of course, a serious condition and is largely produced by the first, and it is a hopeful sign that we are nationally beginning to realize this.

When the margin above cost of production of agricultural products is barely sufficient to pay taxes and actual living expenses, there is not much to spend elsewhere. Low prices for farm products closes factories, causes unemployment and destroys all kinds of business. The knowledge of this is already bringing about the correction.

Years ago we used to hear a lot about pure bred sires, individual records, balanced rations, cow testing associations, herd improvement, economical handling and manufacture of butterfat, and the similar things that have to do with satisfactory production and distribution of milk products; then came unreasonably high prices and inflated values, with the results that we are all having a highty hard time getting back to a normal basis; but whether we like it or not, we are all going to have to get back to the old fashioned, time-enduring proposition of giving value received, with the rewards going to those who excel.

With a temporary over-supply of dairy products, and prices much less than they should be, just what promise does the future hold for the deiryman?

If everyone used all the milk and milk products that they ought to use, and every cow paid a profit, what incentive would exist for improvement? And there is centainly room for improvement in the production manufacture, distribution and consumption of milk.

When the average person consumes less than one-half pint of milk daily, when it ought to be one quart; when in return for feed, barn room and labor, the average cow produces only 4,000 pounds of milk annually, when she should produce twice this amount; and when the margin between what the producer gets and what the consumer pays is twice what it should be, there is indeed plenty of room for improvement.

Unless milk is worth more, it must be produced for less; unless there is sufficient demand for the milk that is produced, a greater demand must be created, both can be accomplished, but not without considerable effort.

We must get together on plans for increasing milk consumption, we must get together on plans for decreasing production costs; we must get together on plans for reducing the manufacturing and distribution costs, and upon the successful working out of these plans depends the happiness and prosperity of all of us.

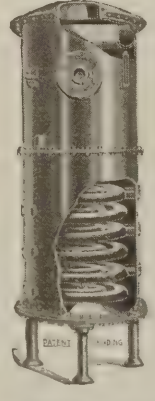
Two years ago we were much alarmed over the certain shortage of food products, a year ago we felt that the solution of the difficulties then confronting us was an enormous publicity campaign to increase the consumption of dairy products, to be carried on through the schools, our boards of health, our state department and college, and our different associations.

The increased demand for their product that publicity campaigns have brought to the orange growers, the walnut raisers and the canning organizations, have been presented to us, and it seemed as though the only logical thing for us, was to go and do likewise.

But it seems to me that the production and manufacture and sale of so vital a human necessity as milk foods will never be similarly promoted or exploited, and should not be.

The problems of decreasing the cost of production and handling are so vast and so far reaching in their benefits to everyone, that they will need our best, most conscientious and sincere efforts.

Now let's for a minute consider some real facts and figures, and as the welfare of the whole dairy industry depends upon the welfare of the man who milks the cow, let's start with the milk producer.



Practibally 3,600,000,000 pounds of milk were produced in Michigan last year from 900,000 cows, this gives us an annual production per cow of around 4,000 pounds of milk, or 150 to 160 pounds of butterfat.

Ten years ago our State Dairy and Food Department estimated that the average American cow produced about 3,600 pounds of milk annually. While the number of cows and pounds of milk have increased enormously, apparently the kind of poor cows we keep have remained much the same, only we have a lot more of them.

When we realize that one cow has produced over 33,000 pounds of milk in one year, and that there are thousands of good cows in Michigan producing from 8,000 to 10,000 pounds, what a lot of poor cows we must have to pull the average down to 4,000 pounds.

And the tragedy of this is, that a lot of our good folks own these 'less that average cows,' and are trying to pay taxes and live on the profits that their less than worthless cows can never make. Careless, indifference, on the part of the owners of these cows is the only reason why so many of them continue to exist.

We all know just how poor the average scrub cow is, just how small the average dairy profits are, and altogether too many cow owners have these average cows, with little or no profits, and are apparently satisfied with both, but there are lots of dairymen who sensi-

bly realize that the days of big prices and big profits are gone, and if they get anything now they will have to really earn it, who are making some real, earnest efforts toward giving better cows better care.

What, then, is being done and what can we all do to make this average cow a better and more profitable cow for her owner? Like every other method of improvement of conditnons, it seems to be a matter of education.

We have all heard on various occasions how much one dollar invested with R. E. Olds or Henry Ford would have amounted to, but I want to refer to something that is open to everyone in the dairy business, and there is no chance of a loss.

Six or eight years ago some Alpena county men organized a co-operative bull association, and starting with their original herds, and building up by pure bred sires, some wonderfully fine grade cows have been developed by this continual use of good pure bred sires; the increased production of the 800 cows in this association amounted last year to about $40,000 per cow for the association average, or a total amount annually of around $32,000, all from an outlay of less than $1,000,

In addition to this, there is the increased value of the surplus stock, and the fact that these men have found out exactly how to make dairy cows profitable; and would not think of using the methods that seem to satisfy altogether too many present day dairymen.

Pure bred sires and individual cow records are sure methods of making Michigan cows better and more profitable to their owners.

A lot of educational work of this kind has been done, and is now being done in Michigan.

Our railroads, agricultural college, and our pure bred cattle association co-operated in a trip over twenty-five northern Michigan counties, coming in contact with over 14,000 interested farmers. Seventy pure bred sires were placed as a direct result; the special train used carried the right kind of dairy cattle, as well as the average kind to show the contrast, particular attention was given to their care, as dairy cattle must be properly handled, and their food must be economically produced.

This work has been followed up by intensive milk and alfalfa campaigns, covering a county at a time and holding eight to ten meetings daily, over a period of ten days. This has already been done in many counties, with wonderful results.

Present conditions are almost forcing the producer to adopt better methods or go out of business. In one of the best dairy counties in the state during one of these ten day campaigns, over 1000 actual cow owners received a lot of plain, hard, unvarnished facts about the conduct of their own business, right in their own barns on their own farms.

Seventy-two cow keepers made a request for pure bred sires, and seventy-four dairymen made application to join cow testing associations, and over one-half of those attending these meetings confessed to the use of scrub sires.

Likewise Michigan is rapidly making progress toward the complete elimination of tuberculosis in cattle. The antagonism that was at first somewhat apparent toward herd inspection has now almost entirely disappeared, with the result that practically all of the large dairy herds in Michigan have been tested, and are now free from all disease, and in many counties every animal has been inspected and disease completely eliminated. It is impossible to estimate the value of this most vitally necessary work, and while all of us realize the need of continuing this educational work to obtain better care of better cows, what are the manufacturers and distributors of the product from these Michigan cows doing to eliminate unsatisfactory conditions surrounding their job of giving better service to the producer and consumer?

While much has been done, greater efforts are necessary in the elimination of wasteful and unnecessary handling and manufacturing costs.

If it is necessary to increase the consumption and give the consumer a square deal, for the producer to lower his cost, then it is equally necessary for the manufacturer and distributor to lessen their expense. Of course, some manufacturers say that this is an impossible thing to do, or at least a most difficult one, and while this is doubtless so, yet the many co-operative ventures into the manufacture and selling game by producers can't help but have beneficial results to all concerned. No manufacturer of dairy products need have any concern about his business, if he be rendering a real service at the lowest possible cost, to both producer and consumer.

The future of this most important Michigan industry is largely up to us, and when men in any business post themselves regarding the conditions affecting their business, and size them up in the right proportion, they have what the world calls good judgment, and this good judgment will allow them to make plans for the future, with fairly certain results.

It may help us in working out our future policy regarding dairying to carefully consider that profitable agriculture is absolutely essential to the permanence of this country; successful and permanent agriculture must include live stock, and dairy cattle are practically the only cattle that can be profitably maintained on

"Price is a relative term—quality always a concrete fact."

Many of our customers tell us they are making better goods with less gelatine; that Delft goes further because of its quality, purity and uniformity.

High prices do not necessarily signify high quality. They may mean high manufacturing costs, due to inefficient management, and in that case the inferiority frequently extends to the product.

Delft Gelatines represent the highest efficiency in manufacture, and are sold on the basis of giving the consumer the greatest intrinsic value at a given price. Better values cannot be obtained at any price.

Let us tell you what our customers say about saving money by using Delft Gelatine. It will pay you to investigate.

Harold A. Sinclair

TRUCKS TANK MOUNTED SAVE LABOR, TIME AND EXPENSE.

high priced land. Milk and milk products are becoming more and more recognized as an absolutely essential human food.

Every child should be receiving one quart of milk daily, instead of less than one pint. The average dairy cow should produce twice as much milk as she now does; but during the past ten years there has apparently been very little increase in the average production.

There are lots of pure bred cows available to anyone at reasonable prices. There are thousands of high producing herds making a profit, even at present prices; and it is up to the dairy producer, as well as the manufacturer to increase the consumption by sane, productive, educational publicity; to decrease the cost of the handling of dairy products by elimination of a lot of wasteful methods; and decrease production costs with better care of better cows.

Things are, after all, just about as they should be, with the world always ready to pay well for good work.

Why is it necessary to have good cows, well fed and cared for in good barns, and the product properly handled before there is much of a profit?

Why is it necessary for the manufacturer and distributor to render real service to both the consumer and the producer, by fair, economical methods?

Why do any of us do anything?

Because we just have to, if we want to get anything worth having or amount to anything ourselves.

Apparently only a few ever find out how to do anything very well.

What incentive would we have for improvement, if it was not absolutely necessary to do things better to get the things that are worth while?

This old world of ours can't run on any other plan, and there is plenty of opportunity for all of us to do things better. If we haven't the desire to improve, nor the will and energy necessary, we just naturally continue our present condition until something comes along and wakes us up, and forces us to put the necessary factors to work.

It would rather seem that present conditions in the dairy business should cause us all to wake up immediately, to the absolute necessity of improving methods and conditions, if we are to expect satisfactory results.

Of course, it won't be easy, but are we entitled to a reward of any kind for doing the easy things? Too many of us are doing things the easy way now.

In concluding I want to say just a word about the future of our association. It must be apparent to all of us, that there is plenty of work to do, and while other organizations, as well as the State Department and College are doing their part, the organizations definitely represented in this association, certainly have their definite work to do, and every organization that expects to accomplish much, needs a competent, well paid secretary or manager.

It would be a serious and grave mistake if this association were to lessen its future activities, instead of increasing them.

While our associations has been instrumental in getting much of this great work under way, that now bids fair to make Michigan the leading dairy state in the Union, there is still plenty of work for this association.

The last few years have brought all of us in closer touch with each other. Our erstwhile competitor and our mistrusted co-worker is rapidly becoming our brother and partner. Co-operation and brotherhood will be civilization's outstanding accomplishment in the present century. Not only co-operation among producers and co-operation among manufacturers, but co-operation between producers and manufacturers, everyone co-operating with everyone else.

Conditions that are not good for everyone are not good for anyone. Our individual and national happiness and prosperity and the future peace of the world will depend entirely on how well we, each of us, individually, practices the Golden Rule.

Better conditions are ahead of us, let's all help bring them about.

* * *

SECRETARY'S ANNUAL REPORT.

Realizing that secretaries' annual reports at their best are but dry and gruesome affairs, and particularly so after listening to such addresses as has been our privilege to do in the last two days; yet notwithstanding this seeming gruesomeness you men who have been paying your dues for the maintenance of an organization, are justified in expecting not only a report, but more or less actual, tangible, vivid results, because of there having existed within your midst this organization that is "bone of your bone and flesh of your flesh."

Viewed from the lookout of unconquered and unaccomplished achievements, our heart grows faint when the great field of opportunity opens like a Sunday paper before our mind. As compared with the work yet undone, we plead to the charge, if charge there be, that accomplishments are meager when stood over against need for the same. But, like the "fighting parson," we believe in our cause, and as we look out over the oncoming season with its more than usual uncertainties, we are glad to recall that within our family fold, the state's most stanch and prosperous, and we believe as a whole, most unselfish creameries of all classes, be they individual, co-operative or central, have enough of "Father"

MAKE THE PUBLIC HUNGRY FOR ICE CREAM BY POSTERS AND DISPLAYS.

Marple's Golden Rule religion within their heart of hearts, that they are willing to contribute "blood money" as it were, to the support of this Association, for the perpetuation of that instinct in the soul of business, that has lived in the hearts of great men and in the life of truly great business, there being a striking resemblance between the extent of possession of this qualification and the real "size" of the individual and of the business he represents.

If this association accomplishes nothing but the burning of the "Honor of Business" or the "Golden Rule idea" a little deeper into the calloused souls of the men of our profession, it will have paid dividends on the investment for the stock holders. Preaching and teaching are arts in themselves, and are as foreign to the ability of your secretary, as the strains of music are foreign to the fish of the sea, but could I, with a magic stroke, write in letters of fire across the office wall of every creameryman of Michigan, a motto for the coming year, and for all time, that motto would contain just four short words, and as you men bend arduously over your task at the desk, or with mouth to long-distance telephone directing policies, instructing men, guiding minds, the heat of those words on yonder wall should burn their impression so consciously upon the soul, that "The Honor of Business" would be paramount to every other issue originating from within that business sanctuary.

I would not infer that Business Honor is not a prominent policy with most of you men. I have lived close enough to you and to your business to know that **in your mind** you are practicing what you consider good business honor. But pardon me for saying "in your mind." I cannot refrain from emphasizing those three words, for therein lies not only the possibility for attainment of the highest degree of Business Honor, but also in this clause can be couched selfishness, subtleness and unfairness. Summed up, is it not safe to say that about the only true measure that can be applied to an individual or to his firm in their extent of possession of genuine business character, when speaking in terms of competitive conditions, is the measure to which this individual or firm are willing to sacrifice personal pride and personal gain for the sake of harmony and general good.

The work that we have been intrusted with for the past two years, has brought us very close to many of the creamerymen of the state and these relations in their various stages of complexity, are valued sacredly.

Though the days have been all too short and the months have conspired each with the one just ahead to deprive us of good intents and ambitions accomplishment, yet today as we stand in the even-tide of another year and review together some of the accomplishments, we would remind you that the list below, in our judgment, represents only the grosser activities of your organization. Men frequently ask, "What is your Association accomplishing?" and to the critical-minded, I confess it is a hard question to answer in a few short syllables, but if a combination of the saliane parts of church, of school, of law, of lodge, of society, could be combined and incorporated into not only your business and the business of every other creamery operator in the state, but into the very heart of that business owner, I ask you, "Would not the effort be worth the while?" To what extent we have succeeded in this, we are unable to measure. Neither can man measure the value of the precepts taught by the lowly Christ and heralded down through the ages from His time to ours.

Regardless of display of literal, visible, tangible results, I believe this Association has a field of endeavor and accomplishment that is very real to those of our members who have attended most zealously our meetings and have participated in our efforts in various lines.

In partial answer as to what the activities of the Association are, the following summary is made up from our daily reports. I might state also that the board of directors get a semi-monthly report in much fuller detail than is possible to give here, but which divulges no information regarding individuals or their business that could be made use of by a competitor to the disadvantage of another.

The following report covers the past fiscal year of February 1, 1921, to February 1, 1922:

Number of regular meetings held.....11
Number of special meetings held..... 6
Number of conferences held.....17
Number of directors' meetings..... 7
Number of farmers' meetings in which the secretary has taken part..... 4

Have attended one meeting in Washington.

Have attended four meetings in Chicago.

Have attended one meeting in Marion, Ind.

Have attended one meeting in Des Moines, Iowa, aside from numerous other meetings.

We have provided each of the regular meetings with a full program.

Have written a weekly letter to each creamery in the state; have written eight general cream buyers' letters to each of our 1200 cream buyers. In our cream improvement campaign we have circularized the bigger part of the cream sellers of the state, eight different

GET THE CORRECT WEIGHT RECORD FROM AN ACCURATE CONTROL.

times with Money Talks bearing on the need of care, and how to care for cream.

We have written approximately 3000 personal letters on as many individual subjects.

Have burnt $260 worth of long-distance telephone and Western Union wire.

Have, in the past year, spent 138 days of an average of 10.8 hours per day in the office and have spent 161 days on the road.

Our reports show in the time spent away from home, we have made 232 creamery visits, 301 cream station visits, 14 ice cream plant visits, 4 condensary visits, 7 cheese factory visits, and 4 dairy farm visits. We have gained 18 new members, and have lost 14. Of the 14 members lost, 4 were through non-payment of dues, 3 through withdrawal, 4 through financial failure, and 3 through sale of business. We have personally checked 59 cream stations for accurate testing, have issued 12 insanitary notices, condemned 6 cans of poor cream and have made one arrest getting a prosecution on the same. Have had one operator to Lansing before the commissioner, the operator admitting to embezzlement of the company funds.

We have secured evidence and submitted same to the Federal Trade Commission on two counts.

We have traveled 9051 miles by rail and 7024 miles by car.

We have put into this work unstintedly, our heart, our time, our energy, our brain, our very life, but the response from you men and others in different acts and words of appreciation, the loyal sacrifice of time of the directors and others, as well as the material support from President Overton, and the co-operation from the Department at Lansing, have made our work a joy; and to whatever extent results have, the splendid harmony and co-operation of you people are a large contributing factor.

But pleasant, and we believe profitable, as has been the past, we must soon turn our back to the yesterdays, for within two weeks will mark the opening of another epoch and the beginning of another year. We would be disloyal to our cause and untrue to the God-given impulse of real men if we did not aspire to make this coming year more resourceful and abounding in the fruits of business integrity, as well as benefiting the industry from the humble cow to the hungry consumer.

Our March meeting has a program of action is now well under way with a definite policy along this line. The extent to which the policies for improved conditions will be cashed in, will depend upon our business honor, our belief in our competitor, our attendance at the meetings and our dead earnest effort to locate wrong in ourselves before accusing a neighbor.

I thank you.

R. F. FRARY,
Secretary.

* * *

HOW CAN THE DEPARTMENT OF AGRICULTURE BEST SERVE DAIRYING?

By H. H. Halladay, Commissioner of Agriculture, before the Michigan Allied Dairy Association, Saginaw, Feb. 14, 1922.

Michigan is one of the foremost agricultural states in the Union, and dairying is one of its most important branches of agriculture. To know the importance of the dairy industry it is necessary to study the conditions affecting it, and also its development. It is true that this branch of agriculture has developed very rapidly in our state during the past few years.

During the last year the dairy farmer has—comparatively speaking—been much better situated than the average farmer. It has been found that by feeding corn, oats and barley to the dairy cow the net returns could be increased more than 40 per cent than by feeding the same to other live stock or marketing the grain direct. This is indeed a strong argument for the dairy farmer.

According to a circular printed by the University of Illinois last December, good cows were returning 85c a bushel for corn, $24 a ton for hay, and $9.50 a ton for silage, when butterfat was worth 35c. These results were obtained from carefully compiled individual feed records for 528 cows. The cows varied in size, breed, production and time of freshening, but were good cows. It is also pointed out in this circular that reasonably heavy feeding is profitable under existing conditions.

According to the United States Bureau of the Census reports on agriculture for Michigan, the farmers of Michigan received for milk, cream, butterfat, dairy butter and cheese during the year of 1909, $26,727,538, and for the same products in 1919 the farmers received $71,074,727. This shows a marvelous increase in receipts for dairy products, but the increase has been to a certain extent due to increased prices. The total number of dairy cattle in Michigan, including calves, is reported to have been on January 1, 1920, 1,256,141, and of this number 802,095, or about 65 per cent, were milking cows. The government reports 196,447 farms in Michigan for 1920 and that of this number of farms 167,641 had dairy cattle. This means that 85.3 per cent of all the farms of Michigan keep one or more dairy cows.

The total production of milk for 1919 was 383,822,631 gallons. It is evident also that Michigan is rapidly be-

A Magic Transformation

ESKIMO PIE BOXES

coming one of the leading states in the manufacture of dairy products. For instance, in 1909 the farmers sold 18,297,691 pounds of butterfat in the form of cream to be used for butter making, and in 1919 the sale of butterfat, as such, amounted to 31,647,906 pounds, a marvelous increase for the ten years. This increase in the sale of butterfat for butter making purposes is also expressed in the fact that during 1909 only 13.9 per cent of all the farms sold such butterfat, while in 1919, 29.7 per cent sold butterfat to creameries and cream stations. It is no wonder then that the Department of Agriculture is vitally interested in the dairy business of the state, and that it has been found necessary to have laws regulating the industry.

As I see it, there are really three important considerations for the improvement in the production of milk at this time:

First. We need better sires to improve the quality of our herds, and I am glad to say that a great amount of good has already been accomplished, especially with the grade herds, by introducing better sires.

Second. We need a better selection of cows. It has been found that the profit rendered by individual animals varies greatly and in fact it is known that a great many of the cattle being fed today do not pay for their feed. Now, when we have a large supply of milk and when we must economize like we have never economized before, is the time, it seems to me, to call out the boarder cow and keep only the better producers.

Third. We need better feeding methods. It is not sufficient to feed a cow alone for her maintenance but we must feed her also for milk production.

The average production for cows in Michigan is about 470 gallons per cow, and it is the belief of many that this could well be increased from 20 to 40 per cent. By proper selection and feeding, etc., this can be done, but it never will be done until the great majority of dairymen are willing to use their pencil finding out exactly where they stand as concerns profit and loss in their business. In this country we want more dairies operated on a permanent basis. European families have been long-time breeders of good stock, and European cattle are now celebrated for their quality, and this is so because of the fact that for generation after generation they have adhered strictly to the production of better animals. We need a stronger effort to build up dairy herds and we need more pure bred stock, although a great amount of improvement can be made by merely raising the standard of our grade animals.

During the first 11 months of 1921 there were 126 million more pounds of creamery butter made in the United States than during the same period for 1920. During these first 11 months of 1921 the storage stock of creamery butter decreased so that on November 1st we had 20 million pounds less butter in storage, and on December 1st, 15 million pounds less in storage than at the same time the year previous. In other words, the people of the United States consumed 140 million more pounds of creamery butter during the first 11 months of 1921 than during the same period for 1920. An increase is also reported for the consumption of milk and ice cream with a small increase for cheese. When butter sells cheaper the consumption is increased, and we must remember that the people cannot afford as much butter now as they formerly could.

The Bureau of Dairying of the Department is endeavoring to assist the dairy industry of the state as much as possible. It should be remembered, however, that one of the main functions of the whole Department of Agriculture is to protect the consuming public, and to assist agriculture, and this cannot be done without a good system of inspection. The dairy business in certain respects needs standardizing and the Bureau of Dairying is attempting now to bring about standard conditions. In connection with the testing of milk and cream, especially, we are endeavoring to bring about conditions which will justify us in saying that milk or cream sold on the butterfat basis is tested correctly in practically all cases. The Babcock test used in calculating the amount of butterfat in milk or cream is thoroughly accurate and reliable when operated under the right conditions. We intend to prescribe these conditions and to give this part of the work a great amount of consideration. It is not good enough to test approximately correct—but operators licensed under the laws of Michigan must test according to certain regulations and must show accurate tests. Those who do not test correctly—of which there are a few undoubtedly—should not be allowed to continue testing.

We intend to be especially thorough with this part of the work, not only for the protection of the producer, but the manufacturer also should be protected. We believe that the producer wants only what is due him, and that the manufacturer will be entirely satisfied with the correct test. At present, arrangements are being made for the giving of testers' examinations under practical conditions and where the ability of an applicant for a license can be judged accurately. The co-operation of the creameries, producers and all others interested in the testing of milk and cream in the state is asked for the purpose of bringing about the best possible conditions in testing for Michigan.

The quality of the dairy products manufactured in the state is equally important and we have already

"Doc" says:
"Every time some people try to think, they make a noise like a boiler shop. Maybe that's why some people in the dairy industry don't try to think. Otherwise they would surely adopt the modern, scientific and economical method of disinfecting and sterilizing by the use of Germ-X—Dairylands Greatest Disinfectant. One ounce of Germ-X to a gallon of water positively kills all bacteria in separators, bottles, pasteurizers, vats, refrigerators, etc. A $3.00 gallon will make 5 barrels-ful. Send for "Directions for Sterilizing." It's free.

MEYER DAIRY EQUIPMENT CO.

3rd and Vine Sts. St. Louis, U. S. A.

found that by requiring better conditions in respect to the manufacture of such products, that the quality of the products themselves was automatically improved. It is not good business to use poor equipment in a creamery or other manufacturing plant, and expect to put out a first-class product. The sanitary conditions of any manufacturing plant are very important and have a direct bearing on the quality of the product manufactured. The dairy products themselves must be standardized. One firm should not be required to sell butter containing at least 80 per cent fat and another allowed to sell butter with 75 per cent fat. Standards are also necessary for ice cream, whole milk and all of the other dairy products.

For the protection of the livestock of the state, it is absolutely necessary to pasteurize skimmed milk, butter milk and whey returned to farmers to be fed to livestock. It is not only necessary to heat these products but they must be pasteurized correctly. That is—at a temperature of 145 degrees Fahrenheit for 30 minutes, or at a temperature of 185 degrees Fahrenheit by the instantaneous method. I believe that any manufacturing plant should consider the welfare of the producers and the consumers. Only recently we found a locality where skimmed milk had been returned unpasteurized and upon testing the cattle in this locality a great many reactors were found. In this one township the indemnities that will have to be paid by the state and government will amount to a very large amount. It is very evident that this condition has been caused through the negligence of one creamery in respect to pasteurization. Most of you are thoroughly aware of the necessity of eradicating bovine tuberculosis and you no doubt realize your responsibility towards the consumer of milk as well as the producer. The success of the dairy business in any locality will depend upon the factors affecting its development and we all have our part to play. The factors that I have referred to are the ones that we consider foremost at this time but they are not by any means the only factors that we have to consider. New problems arise continually and we hope to have capable men at all times who can meet the situation.

REPRESENTED AT SAGINAW.

The show held at Saginaw, Mich., by the Allied Dairy Association, February 14-15-16-17, was the best ever exhibited to the dairy interests of Michigan. More space could have been used than there was available, showing that the supply men are behind the association. This was the largest of its kind in Michigan, and it was said that it was the largest ever held in any state.

Following is a list of the exhibitors and their representatives:

A. H. Barber Creamery Supply Company, Chicago, Ill.
O. E. Harwood
O. C. Slickenmeyer
A. C. Compton

NOVEL FLOAT.

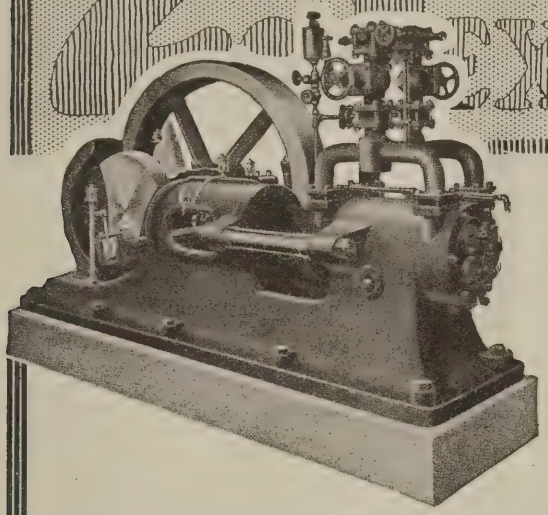
Big Ice Cream Brick Featured in Pageant Attracted Wide Attention.

Conspicuous among the many attractive and nov floats that were featured some time ago in the pagean at Columbus, Ohio, was the float entered by the Telling Belle Vernon Co. The float represented a gigantic bric of Telling's ice cream resting upon a saucer of equa mammoth proportions. The big special Telling's ic cream brick was executed in the natural colors of th three-color "surprise brick" featured each week by Tel ing dealers throughout Columbus and central Ohio.

In the Telling-Belle Vernon plant it is said that Co lumbus has one of the most complete and up-to-date ex clusive ice cream manufacturing establishments in th state. The factory, at present occupied by the firm, wa entirely rebuilt a little over a year ago and at that tim all of the newest and most modern machinery known t the art of ice cream production, was installed. Charl T. Cawrse is general manager of the company.

Real Confidence.

In the sweet silence of the twilight they honey spooned upon the beach.



"Dearest," she murmured, trembling, "now that w are married, I—I have a secret to tell you!"

"What is it, sweetheart?" he asked, softly.

"Can you ever forgive me for deceiving you?" sh sobbed. "My—my left eye is made of glass!"

"Never mind, lovebird," he whispered, gently; "s are the diamonds in your engagement ring!"

25 YEARS EXPERIENCE

Is the proud record of the *CP* Master-Built line of mechanical refrigeration machines. Naturally our engineers and production experts have learned during this long period, how a refrigerating machine should be built to best serve the dairy industry.

CP Refrigerating Machines are obtainable in vertical and horizontal types, in sizes ranging from 1 ton upwards. The vertical machine can be equipped with automatic regulation when desired. May we send you free our new booklet, "How Mechanical Refrigeration Increased Brown's Bank Account?" Address

MICHIGAN ALLIED DAIRY ASSOCIATION.

(Continued from page 108)

me, when in the right-hand corner I spied the photograph of what appeared to be a man of about 21 years of age, Mr. C. J. Yuncker. I immediately put him at the top of my list as the young man I was going to catch at the convention. But then I began to wonder what I should do in case he was unable to be at the convention, if his mother might not let him go so far from home, etc., etc. So I went down the line to get a list of second, third, fourth and fifth choice.

Down in the lower right-hand corner I saw a very good looking man by the name of D. W. Shiel, so I put him on the list as second choice with Mr. Von Jasmund and Mr. Hughes as substitutes if Mr. Shiel failed to qualify. Now I turned over to page 48 and found that I would have to revise my list and place Mr. Miller, Mr. Grove or Mr. Keating in second place as I believed that they were all as good looking as Mr. Shiel. I made a very careful study of all the pages where supplymen, salesmen, etc., were listed up under the head of Badger Flyers, and Poodle Dogs, but I decided that the Michigan Dairy Boosters were the best looking crowd in the lot. Alas, I did not understand nor know the wiles of these boosters, nor the methods they would use in attracting the crowd to the convention. After a good deal of trouble I at last persuaded dad to take me along with him to the show. I arrived early on the morning of February 14 at what is called Michigan's greatest dairy convention, and with my photographs set out to make the round of the booths and get acquainted with the heroes I had read so much about.

One of the first booths I stopped at, the Rex Extract Company, I looked around for Mr. Yuncker was expected to attend the convention. This fat old gentleman informed me that he was the only living representative of the Yuncker family who was allowed in Michigan, and that he was the Yuncker whose photograph I had seen in The Review. So I looked up Mr. D. W. Shiel and was disappointed to find him a man who looked even older than Mr. Yuncker. I went all through the list, visiting every booth in the show, and left the exhibit entirely convinced that the Michigan Dairy Boosters were an unscrupulous bunch of deceivers, for I failed to find one who did not look at least ten years older than his published photograph.

But the show itself was wonderful. Before I left the building, I made some inquiries of a young man by the name of O. E. Harwood, of Chicago. This boy informed me that all the boosters were young men in appearance when they started the work of putting over the 1922 Michigan Allied Dairy Association convention, that their age and appearance was caused entirely by their anxiety, work and worry of getting a convention together that would be the best ever, and that some of the most aged looking old fossils still had young ideas.

Now, I do not believe this boy knew what he was talking about. I really believe the entire bunch to be unscrupulous deceivers who had pictures published of themselves which were taken from ten to twenty years ago, and I, for one, wish to protest against the use of this paper or the United States mails to aid them in deceiving the public any longer.

(MISS) IMA BOOSTER.

Saginaw, Mich., R. F. D. No. 5.

Carlisle Ice Cream Co., Port Huron, Mich.
Detroit Creamery, Detroit, Mich.
Consumers Ice Cream Co., Detroit, Mich.
Artic Ice Cream Co., Detroit, Mich.
Birmingham Ice Cream Co., Birmingham, Mich.
Freeman Dairy Co., Flint, Mich.
Freeman Dairy Co., Saginaw, Mich.
J. H. Bechtol, Cairo, Mich.
Findlay Dairy Co., Findlay, O.

* * *

J. V. Mast Creamery Co., Newark, O., has added a new ton truck to its automotive fleet and has also made some extensive improvements to the plant.

* * *

J. H. Doherty has taken a position with the J. C. Matthews Co. of Detroit, Mich., and will travel in Ohio under the supervision of Mr. J. G. Gundlach.

* * *

The convention of Ohio ice cream manufacturers was held in Columbus, Ohio, on January 31st and February 1st. It was well attended, as usual, and the supply men were there also. Everyone seemed to be happy and is looking for good business for the coming season. All manufacturers were interested in chocolate covered ice cream bars and that seemed to be the principal topic. They all say it is a great seller.

* * *

Election of Officers.

The Michigan Allied Dairy Association held their first quarterly meeting in Lansing, Mich., at Kern's Hotel, on Wednesday, March 1st. The attendance was good and they elected officers for the year of 1922, which are as follows:

President—Glen Overton, Allegan, Mich.
Vice-President—M. L. Noon, Jackson, Mich.
Treasurer—Martin Seidel, Bay City, Mich.
Secretary—Martin Seidel, Bay City, Mich. (temporary).
Executive Commttee—Glen Overton, M. L. Noon, Martin Seidel.

The next quarterly meeting will be held in June.

The Michigan Ice Cream Manufacturers held their firse quarterly meeting at Kern's Hotel, Lansing, Mich., Tuesday, February 28th. They had a big meeting.

The Michigan Dairy Boosters held their first quarterly meeting at Lansing, Mich., at Kern's Hotel on Tuesday, February 28th. C. J. YUNCKER.

ther that he is going to get some "fine-cut," a skull cap and a pair of carpet slippers and join the old soldiers' home if he doesn't get out in a hurry.

If it comes to that, we are going to see that he gets a place in the Old Soldiers' Home at Milwaukee because we feel that a spirit as indomitable as that would be a good one to have in the "home town" so that we could go out often and take lessons from him.

His myriads of friends joins us in hoping that by the time this paper goes to press, Mr. Goodwin will be able to say "Goodbye" to the Elyria hospital for good, and that he will again be seen in his usual good health traveling the old territory for the Elyria Enameled Products Company.

NORTH CAROLINA ICE CREAM ASSOCIATION BULLETIN NO. 5.

The matter of the copies of the Sanitary Law to be distributed to the members has been delayed owing to several conferences with Mr. Allen of the Department of Agriculture. It has finally been decided that the state will pay for these and instead of sending copies of the whole law we have only had that section printed pertaining to the return of equipment, section 12. This will be printed on paper the size of a postal card and can be slipped in bills and letters at intervals. Mr. Allen agrees with your secretary that it would not be wise to send them constantly to the customers, but several times during the season when it will do the most good. As soon as they are received, a supply will be sent you.

It was true about Dixon attending the "Broadway Whirls" again, making the third time. Sly old fox, isn't he?

A late ruling of Internal Revenue Commissioner Blair may be of interest to you: "A general extension of time for the filing of income tax returns was granted today by Internal Revenue Commissioner Blair. Corporations are given to June 15th, under a new treasury decision, for completing returns of income for calendar year 1921, the fiscal year ended January 31, 1922, and the firscal year ending Feb. 28, 1922. The extension is conditioned upon corporations filing tentative returns by March 15th, April 15th and May 15th according to the yearly basis used, accompanied with one-fourth the estimated amount of the tax due."

Up to the present time there has been no exchange of credits made owing to the fact that no one has sent in a list of delinquents. I have been feeling glad of this as I decided you were all collecting your bills and had no bad customers. The decision reached at the convention in Atlanta was that the secretary was to send out these notices on the first and fifteenth of each month from April to October, and thereafter once a month. Please keep this in mind, as it is one of the most important things the association has ever carried through.

A literary gem, by A. E. Dixon—

PIE! PIE! PIE!
Oh! why, why do they cry
For more Eskimo Pie?
Because you're dear,
Good little Pie,
That's why.

The time has not come
For the chocolate to run,
But it will run,
And there'll be some rum fun
Bye and bye.
Good-bye dear Eskimo Pie,
Don't cry, don't cry!

A. E. DIXON, Secretary.

Ice Cream Review:

Your kind favor of the 25th of January was forwarded to me here from our New York office; quite a time reaching me, but you know a "Dixie Flyer" has to be on the go in order to hold up the reputation of such a wonderful name, and organization.

I am on a protracted trip through the far west—will cover the Pacific coast next five or six weeks, when I will return to dear old "Dixie Land."

I attended the Kansas convention. No doubt the Review has received full particulars concerning same. Will say, however, for the benefit of the Kansas Ice Cream Manufacturers and the Jack Rabbits in attendance, it was one of the snappiest and meatiest ice cream meetings I ever attended. Too much credit cannot be given to the men who got up the program all the way through.

As I travel westward I find the ice cream men as a whole most optimistic concerning business for '22. In fact they are doing more business this time of the year than they have in several years past. A great deal of this is due to the coated ice cream bars. This has been a life saver to many an ice cream man and, where some of them believe it will die down to a certain extent when warm weather sets in, the fact remains it has helped most materially during the quiet months of the ice cream industry.

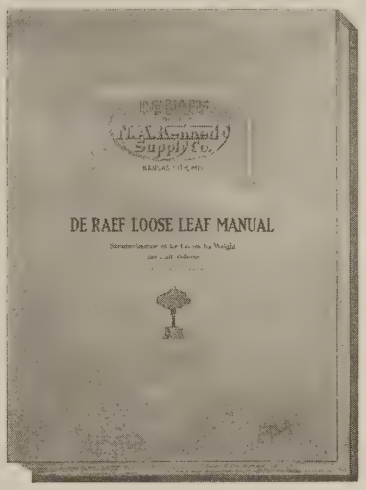
The coated ice cream bar will be put before the public in this city tomorrow—a little late getting here, but here I believe to stay, judging from the enthusiasm shown by the two ice cream concerns who will put it out.

I am looking forward to Washington, Oregon and California with much interest. Reports keep coming to me that business in that section is good. Will know more about it a little later and it will be my pleasure reporting same to you in due time.

When I left the South, conditions there were brightening up in good shape, and I know when I return the general conditions will be much better. We are making wonderful strides in the right direction there, where in the past the southern manufacturers have had the reputation of putting out inferior ice cream, this has absolutely been eliminated. It is quality first, last and always. To this I attribute the wonderful forward strides in this line.

The Dixie Flyers are still to the front and the ice cream manufacturer all over the southland is your friend. They freely admit you are their friend, and have done more for them than they ever will be able to repay.

It is indeed a pleasure calling on this class of merchants or manufacturers and I know a great number of the boys will bear me out in this.



Again thanking you for your very kind favors, with kindest regards and well wishes to yourself and the Ice Cream Review, I am,

Sincerely yours,
PETE MILLER.

The wealth of a nation lies in the prosperity of its people. The power of a Want Add is in the number of subscribers reading them. Do you read The Ice Cream Review Want Ads—regularly?

EXPORT DEMAND FOR CONDENSED AND EVAPORATED MILK LIGHTER.

Despite the continued effort of manufacturers to increase sales, condensed and evaporated milk markets still occupy a position which the trade generally do not yet consider satisfactory. Following the cuts in prices which were made by some manufacturers the past month or so, some increases in sales were realized which in itself served to restore a degree of confidence, but on the whole no material change of much consequence has occurred nor is looked for in the immediate future.

Relief buying at New York has continued to be a factor of importance, although it is reported that with the calls for bids on 75,000 cases of evaporated late in February, the supplying of this demand is nearing completion. Few of the trade anticipate much export demand unless prices continue to go lower, for European countries are said to be getting back to a pre-war basis of production and will be competing for this business. The recent price declines on manufactured goods were partly made possible by lower raw milk costs, but the consensus of opinion seems to be that unless butter prices show material reductions milk prices will not go much below their present level until the spring drop comes later on. Just now butter markets are maintaining a steady tone under an apparent decrease in production and the consequent falling off in receipts at the markets, also because imports of foreign butter have for the time being ceased to be a factor of influence on account of firmer markets abroad. Some condensaries are still closed, others are making butter ,and most of those which are condensing are said to be working on the lowest production possible in order to avoid accumulated stocks, in some cases it having become necessary to cancel contracts with producers or accept only part of the milk contracted for.

January Shipments 40 Per Cent Less Than in 1921.

January export figures show an increase of over a million pounds in the exports of condensed milk, but a reduction of over 5,000,000 pounds of evaporated as compared with the previous month. As will be noted, from the accompanying tables, the combined January exports of condensed and evaporated goods were nearly 12,000,000 pounds less than in January, 1921, during which month shipments totaled 30,191,000 pounds. Of the 10,340,000 pounds of evaporated milk exported in January of this year over 4,750,000 pounds went to Germany, but it is probable that part of this amount was for Russian relief, shipped via Hamburg. Further heavy

shipments of milk purchased for Russian relief during January were made during February on account of clearances not being obtainable in January. Much of this is said to have gone via Hamburg also, although some was to have gone direct.

NEW ICE CREAM COMPANY IN ANADARKO, OKLAHOMA.

The Washita Valley Ice Cream Company, Anadarko, Okla., incorporated under the Oklahoma laws January 9, 1922, with a capital of $10,000, for the manufacture of ice cream.

T. L. Whittaker of Birmingham, Ala., is the president; Leo T. Whittaker of Chicago, Ill., is vice president and secretary, and H. K. Whittaker of Chicago is treasurer of the new company.

The new factory is located next door to the Anadarko Ice Company, and the plant will be opened for business some time in March. It is fully equipped with the latest and best machinery on the market and the new firm will try to make it the cleanest and most up-to-date ice cream factory in the state of Oklahoma. The ice cream will be made wholly from natural milk and cream.

STANDARD VANILLA AND BLENDS

THERE is a distinct advantage in concentrating effort in a single, fixed direction in this age of specialization. It leads to the mastery of art and the perfection of aims. It creates the presumption that at least one thing is done well. It establishes confidence and security, whether in the arts or sciences or even in business. And every business ought to be developed in a fixed direction.

This is our aim and purpose,—to do at least one thing well; to produce something that is a little better and that gives a little more satisfaction; to gain your entire confidence and in return to give you a security in our products that will develop your own aims and purpose.

Condensed Milk and Milk Powder

(BY OTTO F. HUNZIKER)

THE THIRD EDITION of This Book Has Just Come from the Press.

This work represents a new book from cover to cover. It contains the description of the latest equipment and of the most improved methods and practices in the manufacture of every marketable line of condensed and dried milk products.

The More Outstanding New Features Are:

New methods for cooling sweetened condensed milk to prevent grittiness and sugar sediment.

New methods for sterilizing evaporated milk to prevent formation of a permanent curd.

Viscosity tests.

Condensing and drying of buttermilk by commercially practical methods.

The use of the Ruff Condenser.

Description of 20 different processes of desiccating milk by the dough-drying principle, the film-drying principle, and the spray-drying principle.

Detailed discussion of the commercial manufacture of powdered milk.

Cost of manufacture, composition solubility, properties, defects and keeping quality of milk powders.

All other chapters have been revised so as to make available such information as will be of the greatest service in the successful manufacture and marketing of condensed and dried milk products under the new and changed conditions of the industry.

The price of this new and enlarged volume is $5.75 per copy.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

NO GOVERNMENT SANCTION.

Washington, D. C., Feb. 24.—It was definitely stated in official circles that there is no basis for statements that this government will sanction an agreement providing for a reduction in the tariff on imported sugar in consideration of limitation of sugar exports from Cuba to the United States. No proposal of the kind is under consideration here, it is said, and the report is generally ascribed to propaganda by interests seeking to bring about a reduction of the tariff.

* * *

LOWER FREIGHT RATES SOUGHT.

President J. W. Herscher of the National Wholesale Grocers' Association, in an address recently delivered before the New York Wholesale Grocers' Association, told how the increase in freight rates on sugar since 1914 was just an example of the increased cost of transporting commodities within the United States. "I wish to cite to you the fact that the cost to ship sugar in 1914 from New York to points on the Ohio river was 16¼ cents, while at the present time the rate is 50 cents, a 200 per cent increase in transportation charges in carload lots from the refiner to the wholesaler," said Mr. Herscher, making the argument that freight rates must be reduced before the cost of living can be greatly lowered.

Officers of the association were elected as follows for 1922: President, E. S. Truesdell, Binghamton; first vice president, Arthur P. Williams, New York; second vice president, H. S. Reynolds; treasurer, Howard L. Sills, New York.

* * *

UNLIKELY THAT EXPORTS TO U. S. WILL BE LIMITED.

Dispatches from Havana recently carried the information that a special committee made up of members of the Cuban congress, designated by President Zayas, had reported in favor of limiting exports to the United States of Cuban sugar of the present crop, says Facts About Sugar. Apparently considerable misapprehension has been caused in sugar trade circles as a result of this report, which has been taken as indicating the probability of further governmental control and regulation of sugar. To this the trade, in view of past experiences, is greatly opposed.

Such support as the proposed restriction of Cuban exports to the United States receives in Cuba is based on the possibility that it can be made the means of bringing about a reduction in the tariff on Cuban sugar from the rate of 1.60 cents a pound, imposed by the present law. Unless Cuba receives definite promise of a further concession in the matter of tariff, there is no probability of Cuban legislation restricting exports. Even though a reduction in the tariff rate were certain there is strong opposition in Cuba to obtaining it by a bargain that would limit Cuba's freedom of action in the sale of her sugar. This opposition is particularly strong among the sugar producers of the island who, naturally, are the ones chiefly concerned in the proposal.

In the United States the feeling against the suggested agreement is even stronger than it is in Cuba. Some of the press reports make it appear that the plan for a reduction in the duty on Cuban sugar on the one hand, and a definite limitation to 2,500,000 tons or less of the quantity to be shipped by Cuba to the United States from the current crop on the other, has the endorsement and support of the sugar producers of the United States, or at least of the beet sugar industry. So far from this being the fact, it is our information that this proposal was decisively rejected by the members of this industry when placed before them, and that it has received no encouragement whatever from any association of domestic producers.

Apparently the proposal had its inception in certain conferences held several months ago under the leadership of Secretary Hoover in an effort to bring about an agreement between Cuban and domestic sugar interests on the tariff rate to be imposed on Cuban sugar in the bill now pending in Congress. At that time there was an unsold surplus of 1,500,000 tons or more of old crop sugars in Cuba and it was argued that definite knowledge that imports from Cuba during 1922 would not exceed a stated quantity would have a sustaining influence on prices, to the benefit of holders of unsold sugars in both countries. No agreement was reached at that time, however, and none has been arrived at since. In fact the situation has changed so radically that some of those who favored the proposal at that time are against any action of the sort now. Of the Cuban stocks on hand last December, some 80 per cent has been sold, and while present indications point to a large outturn in Cuba during the present season, confidence exists that the pro-

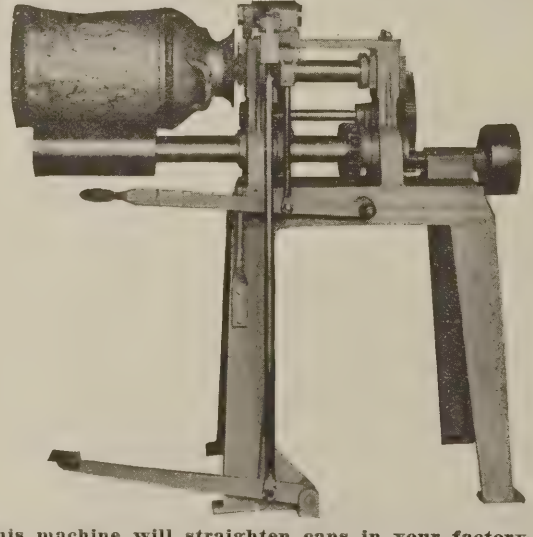
A Good Way To Economize

For a reasonable expenditure per can we give them a new lease on life that in many cases doubles the usual length of service.

Then, too, dented cans are expensive to use, especially if you buy "by the can," you don't get the full measure you pay for.



Why continue to deceive yourself when an economical remedy is possible thru "Manitowoc" Rebuilding and Retinning Service. Satisfaction Guaranteed.

Let us tell you more about our service and some of the many customers who use it.

duction will all be disposed of, or, at least, that the carry-over at the end of the year will be very small.

The position of the sugar producers of the United States is that the increase in duty which they have asked for is necessary to enable them to continue in business in competition with Cuba. They base their claim upon the relative costs of production in the two countries as determined by official investigations in the past and by present differences in prevailing wages and other items of cost. It is an accepted fact that sugar can be produced in Cuba more cheaply than in the United States ;and the only point as to which controversy exists is the extent of tariff protection required to permit domestic producers to compete on even terms with Cuban and other outside producers. Obviously, the amount of the tariff is the all-important consideration to producers within the United States, and acceptance of a permanent decrease in the Cuban duty in exchange for a temporary limitation of Cuban imports would only defer the destructive competition which they fear, in view of Cuba's demonstrated ability to produce all, or practically all, the sugar required by this country.

Opposition to the plan on the part of Cuban producers, or at least of a large number of them, is based on the ground that an agreement to restrict their exports would be a derogation of the dignity and independence of their country and would place them in a disadvantageous position for the sale of that part of their crop which could not be sent to the United States.

In order to give effect to the proposed plan, it would be necessary to have affirmative action from the Cuban Congress and the Congress of the United States. It is extremely doubtful if such action can be had from either body, especially in view of the determined opposition that will be encountered from members of the sugar industry in both countries. Certainly there can be no doubt that sugar producers within the United States will oppose any reduction of the tariff at this time with all the strength they can muster, and apparently an influential body of Cuban producers is equally against any agreement that would limit the freedom of movement of their sugar.

* * *

TRADING RECORD OF NEW YORK EXCHANGE.

Monday, February 20th, was the biggest trading day in sugar futures in the history of the New York Sugar Exchange, the volume of business recorded being larger even than that produced by the forced liquidation during the war, when the government halted the exchange's activities. At that time some 48,000 tons of raw sugar were sold under compulsion. February 20th the sales aggregated 51,300 tons.

This record, moreover, resulted apparently from the natural growth of the exchange's business. According to members, it represented trading from every part of the country. Not only was business widely distributed, but firms engaged in actual sugar handling took part in the trading on the exchange to a liberal extent.

The rush of business which reached its crest February 20th was first noticeably apparent February 18th, when over 10,000 tons of sugar were sold in the hour and a quarter available for trading in the morning.

February 21st, more than 27,000 tons were sold, representing a volume of business far above the daily average, though not as high as the day previous.

Prices Fall on Heavy Offerings.

Prices during the week beginning February 20th showed a decline, which was most marked on the first day, despite the heavy trading. The weakness appears to have developed in the afternoon and to be due to

heavy offerings at that time, when prices declined about 8 points in a short period.

A slight further decline was registered later, lowest prices being reached February 23rd. The range of raw sugar prices was as follows:

	High	Low	Closing
March	2.30	2.11	2.15
May	2.50	2.35	2.37
July	2.68	2.54	2.57
September	2.81	2.69	2.70
December	2.78	2.67	2.68

U. S. A. IN THE SUGAR RACE.

By Earl D. Babst, President, American Sugar Refining Co.

Broadly speaking, the United States controls about one-half of the sugar of the world outside the former battle lines of Europe. Since the armistice little progress has been made in reviving the sugar industry within the war area, so there still is little exportable surplus. The world's supplies and demands remain in about the same proportion as during the war.

The United States sugar industry as a great world factor is an incident and accident of the Spanish war. We went to war to save Cuba and by accident got the Philippines. Porto Rico was an accident. Cuba was not so fortunate as either of these.

The signing of the Treaty of Paris, in 1898, at the close of the Spanish war, marks the beginning of a noteworthy period in the sugar development of the United States and of Cuba. The Reciprocity Treaty with Cuba, as well as other organic law, distinctly recognizes a trade alliance. One billion of American capital was invested in Cuba, bringing about an increase in her sugar production. The Hawaiian Islands were annexed early in that year, while Porto Rico and the Philippines were ceded by the Treaty of Paris. Recently the United States has acquired the Virgin Islands and has established closer relations with Santo Domingo and Hayti.

The so-called United States field may be described, therefore, as comprising the beet and cane sugar of the United States, the cane sugar of Hawaii, Porto Rico, the Philippines, Santo Domingo, Hayti, the Virgin Islands, and, by reason of the Reciprocity Treaty and of our investments, the cane sugar of Cuba. The total production of the United States field in the year 1898 is set forth in the following table:

	Tons.
United States Beet	41,000
Louisiana and Texas Cane	310,000
Hawaii	225,000
Porto Rico	54,000
Philippines	150,000
Santo Domingo and Hayti	48,000
Virgin Islands	13,000
Cuba	315,000
Total	$1,156,000

At the outbreak of the European war, in 1914, there had been the large development shown by the following table of production for 1913:

	Tons.
United States Beet	624,000
Louisiana and Texas Cane	153,000
Hawaii	488,000
Porto Rico	350,000
Philippines	155,000
Santo Domingo and Hayti	84,000
Virgin Islands	6,000
Cuba	2,428,000
Total	4,288,000

Europe was Big Producer.

Before 1914 almost half of the world's sugar was produced in Europe. The Great War came and one-half of Europe's production was enclosed within the battle lines. What with devastation, neglect and the substitution of other crops, the sugar output of the war area is now 2,000,000 tons less than in pre-war days. The Old World's loss has been the New World's gain, however, for these 2,000,000 tons have been added to the productions of the United States and Cuba. At the present time, therefore, half of the world's production is in the Western Hemisphere, Europe and the Far East together constituting the other half.

The United States and Cuban fields were the only ones available to the allied countries when war was declared. Consequently, at the outbreak of hostilities, Great Britain, France, Italy and other European countries immediately entered the United States and Cuban markets. Prices naturally rose under this forced draft, giving greater impetus to the already increased production of the United States field. In contrast with the foregoing tables, the one below gives the production for that field in the year 1921, which shows an increase since the outbreak of the war of over 2,000,000 long tons, most of which has been in Cuba:

	Tons.
United States Beet	969,000
Louisiana and Texas Cane	157,000
Hawaii	508,000
Porto Rico	437,000
Philippines	252,000
Santo Domingo and Hayti	191,000
Virgin Islands	4,000
Cuba	3,936,000
Total	6,454,000

The United States and Cuban fields are sufficient to meet for some years all the needs of the United States and of Europe. It would have been a wise provision if some commitments, aside from informal assurances, had been secured by Washington before it inaugurated its war program of stimulation of sugar production in the United States field. If, however, the industry of the United States and of Cuba has the continued support of the respective governments, there are many reasons to expect that it will be able to hold a large part of the business which came so unexpectedly during the war. This can be made of special advantage to the consumers of the United States, and that, too, without scrimping on domestic requirements.

High Prices Detrimental.

The recent inflation period has demonstrated once more that high prices are detrimental. A lower range of prices is beneficial, not only to the public, but to the industry. Less capital is involved and hazardous risks are eliminated from the business. A smaller manufacturing margin becomes possible and the consumer and industry benefit equally: the consumer by low prices, industry by increased sales.

During the war the producers and refiners of the United States and Cuba fitted their operations into a world program, making possible a period of moderate world prices and an international division of supplies of boundless benefit to consumers, both domestic and foreign. The initiative of producers and refiners and the investment of hundreds of millions of American capital have made possible in Cuba and the United States a vast increase in the production of a food staple of pre-eminent world importance. The world needs this sugar. The United States has the excess capacity to refine a million tons for export. Not another brick need be laid.

There is bound to be a race for foreign markets. Will

FLAVOR YOUR ICE CREAM WITH

Cremilla

NEW ORLEANS, U. S. A.

the ultimate prize go to Cuba and the United States, or will it go elsewhere? Washington can help by giving permission, as proposed, to refine in bond in the manner already accorded by law to other manufacturers, smelters and refiners. The ultimate answer, however, must be made by the industry itself. It had the pioneer courage to invest hundreds of millions in production. Without doubt it will have the courage and the vision to find and to hold foreign markets rather than cut production unnecessarily and so lead to a period of high prices.—New York American, Jan. 9, 1922.

NEW FREIGHT TARIFF LETS WESTERN BEET INTO EAST.

Effect Is to Lower Rates to Points East of Illinois-Indiana Line—Trunk Lines to Oppose.

Reports current recently that freight rates on sugar from Colorado points to Chicago territory had been reduced 14 cents by a tariff becoming effective March 3 appear to have been based on a misconstruction of a recently filed tariff reducing rates from the same points to St. Paul territory, says Facts About Sugar. The section of the tariff referring to ponits east of the Mississippi, as filed with the interstate commerce commission, reads as follows:

"Sugar, C. L. minimum weight as described in item No. 230. Applies only on traffic destined to points east of the Illinois-Indiana state line, as named in item No. 10, as amended, of W. T. L. territorial directory No. 1 A. E. B. Boyd's I. C. C. No. 797, supplements thereto and reissues thereof."

The tariff sheet goes on to name the points covered by it, for which a 48-cent rate is established, these being Alton, Burlington, East Clinton, East Dubuque, East

Dayton, Ohio

NEBRASKA ASSOCIATION OF ICE CREAM MANUFACTURERS.

The Ice Cream Review:—

Your favor of February 22nd, written on the birthday anniversary of the Father of our Country, was received, and in addition to sympathizing with you for having to work on a holiday, the thought comes to my mind that George Washington and his associates, in their great work for this country, might have had their hardships considerable lightened if they had made the acquaintance of that great dish, ice cream, especially in the irresistible form of the coated ice cream bar. The cold weather around Valley Forge and the abundance of ice in the Delaware river would have furnished them with the means of freezing the ice cream, if they had only known how to make it.

First, I will take up that part of your letter pertaining to the question of holding an annual convention of our association. You will recall that we held a business meeting at Lincoln, January 6th and 7th, and during that meeting transacted about all the business that came up during the year. This included the election of officers and the appointment of the standing committees. At that same meeting it was decided to hold a series of district meetings, which since that time have been held at Norfolk and Grand Island, and last Thursday, the 23rd, the last one was held at Omaha. At the Omaha meeting all the officers and directors were present, and in addition so many of the factories were represented that a canvass showed that about 80 per cent of the ice cream manufacturers in Nebraska were represented. Due to this good attendance, the matter of holding a convention was gone over, and it was the unanimous opinion of those present that, since at the four meetings that had been held almost all the members had attended at least one, and many all of them, it would not be necessary to hold a convention, chiefly for the reason that there would be no business of any nature to transact, and the members would not care to spend their time and money for a meeting of this kind.

For your information will state that our Express Committee was successful in presenting evidence to the Nebraska Railway Commission that convinced them that there should be no change in the present weight of 100 pounds for a five-gallon packer of ice cream.

Our legislative committee, while they were not successful in securing a reduction of the present 14 per cent butterfat standard down to 10.5 to correspond with Colorado and Kansas, they did succeed in getting the present law changed to permit the manufacture of ice cream at lower than 14 per cent when for shipment out of the state.

The Committee on Code of Fair Practice presented a very good and thorough report. At several of the district meetings some very good paragraphs were added, and the matter was left in the hands of the officers and directors to revise, complete and compile, and have printed and distributed among the members. When completed we will see that you are furnished with several copies.

The Credit Committee reviewed the situation, and authorized the secretary to revise and make any changes in the present credit system he might deem proper. It was the unanimous opinion that the credit system not only saved the members a great deal of money, but also was the means of causing the customers to pay up their bills more promptly.

At the Omaha meeting, where the actions taken at other meetings were reviewed and final action taken, the members and officers were so well pleased with the

TIN FOIL

work done by the secretary in the line of credits during the past three years that the name of our association was changed to "Nebraska Ice Cream Makers' Credit Association." Until the present supply of stationery is used up, they will use a rubber stamp on all invoices, statements and letters that will read as follows: "We are all members of the Nebraska Ice Cream Makers' Credit Association." When new stationery is ordered, this will be printed on it in red ink.

The Committee on Marks and Brands presented their report, and gave a list of all the marks and brands that were filed with the secretary of state to this date. The secretary was instructed in the report to have this list mimeographed and a copy sent to each member with the request that it be checked over, and in case his brand and marks were not on file, to make application through the secretary. This was adopted.

The report of the secretary and tresaurer was referred to an auditing committee, who reported it correct, and it was approved unanimously.

Various other matters of interest to the manufacturers came up and were discussed very thoroughly. I am pleased to be in a position to say that during the twelve years of the existence of this association there never has been a time when the general conditions and prospects for the season's business looked more encouraging than at the present time.

Every town, both large and small, has a good supply of fine ice, and many of the retailers who keep their fountains open all the year round are now getting their prices down to 10 cents a dish for plain ice cream and a nickel for the cone, all of which will certainly increase the gallonage this year.

This is about as complete a report of the situation as I can give you for the present. I am sorry that we

TAG HOOKS

will have to disappoint you by not holding a convention, for we would like to have you out here with us. However, there is a strong probability that we will have a picnic later on when the weather gets a little more ice creamy, at some resort either at Omaha or Fremont, and we will see that you get an invitation.

R. W. McGINNIS, Secretary.

NEWS ABOUT SUGAR.

(Continued from page 139)

Ft. Madison, East Hannibal, East Keokuk, East Louisiana, Keithsburg, Moline, Quincy, Rock Island and Savanna, all in Illinois and all comprised in the so-called Mississippi river crossings group.

Substantially, therefore, the rate change would not appear to apply to Chicago, but only to shipments from Colorado to points beyond the Illinois-Indiana line, in which case the 48-cent rate would apply to the Mississippi river crossing and a local rate from that point on.

Opens Central States Field.

The immediate result of this, should the tariff go into effect, would be to open to the western beet sugar factories territory at present served largely by the eastern beet sugar companies and at times by the Atlantic seaboard refiners. Whether the rate will be opposed by the eastern beet companies has not developed.

The trunk lines, it is understood, however, have already decided to fight the new tariff, and it is considered more than likely that some of the eastern refining interests will join hands with them on this issue.

GET YOUR COPY.

We have just received a copy of the new farm and dairy equipment catalog No. F-1 put out by the Dairymen's Manufacturing and Supply Co., of St. Louis, Mo. In this catalog is included a complete line of equipment necessary for a modern creamery, milk plant, ice cream factory and the farm dairy. Mr. B. Riley Hauk, the president of the company, is devoting his entire time to building up a first class organization, handling the best makes of dairy equipment.

Besides Mr. Hauk as president, the officers are J. C. Barringer, secretary and treasurer; E. G. Blankenmeister, vice-president and advertising manager, and Wm. Seifert, consulting and erecting engineer.

You can't afford to miss a single copy of the "Ice Cream Review." Did you send in your renewal?

SEVENTH ANNUAL CONVENTION WISCONSIN ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 12)

percentage composition of these various foods arrived at? By the quantative analysis of thousands of authentic samples of these various foods.

Now as to the standardization of manufactured foods, what is to be our guide there? Are we to go onto the market purchase and analyze thousands of samples of this class of foods, tabulate the results and be guided entirely by this data? No. Why? Because the work of man is not like the work of nature. What then is to be the procedure in establishing these standards. A thorough and painstaking study of the processes of manufacture to determine what may reasonably be expected. A thorough study of the definition of the food to be standardized. A just consideration of what the public has a right to expect. Wholesomeness, economy and freedom from fraud, are some of the guiding principles. How are the ends sought accomplished? By hearings at which the trade is represented and the people are represented by food officials and their chemists. Gentlemen, this is precisely what took place when the present standards for ice cream were prepared for consideration at the last session of the legislature. I think this a fitting place to read these standards.

Ice Cream. Section 4601-4a. (10) (Chapter 331, Laws of 1921) (a) Ice cream is a frozen product made from cream, or milk and cream, and sugar, and may contain added milk solids, added milk fat, eggs, natural flavoring, edible gelatine or harmless vegetable gum, and shall contain not less than twelve per cent of milk fat, nor more than one-half of one per cent of the said gelatine or gum, or a mixture of the said gelatine and gum. The volume of ice cream after being melted shall be not less than one-half the volume of the ice cream as manufactured and sold.

This last sentence is in addition to the standardization of ice cream and I will point out a little later the necessity in our laws for this addition.

(b) Fruit ice cream is a frozen product made from cream, or milk and cream, sugar and sound, clean, mature fruit, and may contain added milk solids, added milk fat, eggs, natural flavoring, harmless color, edible gelatine or harmless vegetable gum, and shall contain not less than ten per cent of milk fat, nor more than one-half of one per cent of the said gelatine or gum, or a mixture of the said gelatine and gum. The volume of fruit ice cream after being melted shall be not less than one-half of the volume of the fruit ice cream as manufactured and sold.

(c) Nut ice cream is a frozen product made from cream, or milk and cream, sugar, and sound, nonrancid nuts, and may contain added milk solids, added milk fat, eggs, natural flavoring, harmless color, edible gelatine or harmless vegetable gum, and shall contain not less than ten per cent of milk fat, nor more than one-half of one per cent of the said gelatine or gum, or a mixture of the said gelatine and gum. The volume of nut ice cream after being melted shall be not less than one-half the volume of the nut ice cream as manufactured and sold.

(d) Chocolate or cocoa ice cream and caramel ice cream are frozen products made from cream, or milk and cream, sugar, chocolate or cocoa, caramel, and may contain added milk solids, added milk fat, eggs, natural flavoring, edible gelatine or harmless vegetable gum, and shall contain not less than ten per cent of milk fat, nor more than one-half of one per cent of the said gelatine or gum, or a mixture of the said gelatine and gum. The volume of chocolate or cocoa ice cream or

caramel ice cream after being melted shall be not less than one-half the volume of the chocolate or cocoa ice cream or caramel ice cream as manufactured and sold.

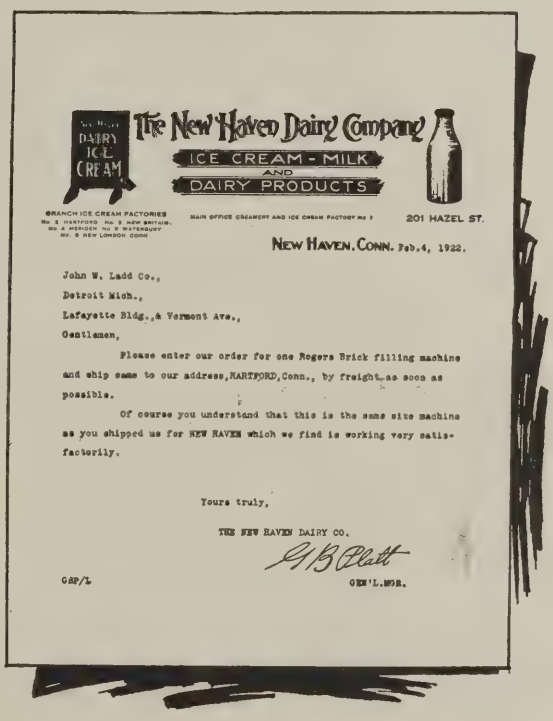
(e) Orange ice cream, lemon ice cream and wintergreen ice cream are frozen products made from cream, or milk and cream, sugar and orange flavoring, lemon flavoring or wintergreen flavoring, and may contain added milk solids, added milk fat, eggs, harmless color, edible gelatine or harmless vegetable gum, and shall contain not less than twelve per cent of milk fat, nor more than one-half of one per cent of one per cent of the said gelatine or gum, or a mixture of the said gelatine and gum. The volume of orange ice cream, lemon ice cream, caramel ice cream or wintergreen ice cream atfer being melted shall not be less than one-half the volume of the orange ice cream, lemon ice cream, caramel ice cream, or wintergreen ice cream as manufactured and sold.

We come down to the last one, which is the standard for maple ice cream. I am picking that out to read because I consider it of special importance.

(f) Maple ice cream is a frozen product made from cream, or milk and cream, sugar, and maple sugar, or maple syrup, and may contain added milk solids, added milk fat, eggs, harmless color, edible gelatine or harmless vegetable gum, and shall contain not less than ten per cent of milk fat, nor more than one-half of one per cent of the said gelatine or gum, or a mixture of the said gelatine and gum. The volume of maple ice cream after being melted shall not be less than one-half the volume of the maple ice cream as manufactured and sold.

As you have noticed the standards for ice creams contain a provision whereby the volume to which the product can be expanded is fixed. For a number of years it has been known that the manufacturer of ice cream could control this expansion quite accurately. In order, therefore, that the public might receive a fixed minimum amount of butterfat in any stated volume of ice cream, it was necessary to provide a means for controlling the swell, or expansion, or we might have radically changed the methods whereby ice cream is now sold, that is by volume, to a requirement that ice cream be sold by weight. The ice cream industry is an important one. It had grown up on a method of sale by volume and to have changed this method of sale to one by weight in my opinion would have hampered the sale of ice cream considerably. I have carefully studied the standards fixed by various states and nowhere do I find this unique method of getting a definite amount of butterfat, the most expensive and important ingredient in ice cream, into a stated volume. I therefore claim that once again Wisconsin leads in the subject of food legislation and food control.

Just as ice cream has been defined and standardized, so have the various products used in its manufacture been defined and standardized with but two exceptions. The exceptions are coloring and vegetable gum, but the purity of these substances are guaranteed by the requirement that they be harmless.



It is not to be wondered at, therefore, that ice cream has grown to be a food of major importance when we consider its composition. It supplies in the diet, with but one exception, all the essential elements of nutrition,—fat, carbohydrate and protein—lacking only iron. With the more recent development of the science of nutrition we have learned some important facts concerning the fat contained in ice cream. Nutritional science used to teach that fat was an essential element, but today scientists go a step farther and teach that a fat rich in vitamines is essential. Milk fat, commonly called butterfat leads all other fats in vitamine content.

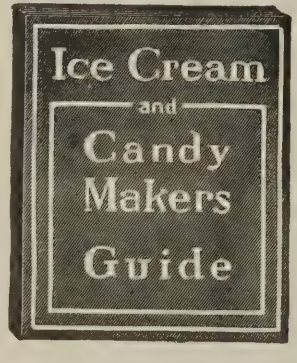
Ice cream, rich in butterfat, is therefore an important food and deserves protection from adulteration so that it may maintain the place it has made for itself and may become to be known more generally as containing those elements so essential to nutrition.

The standardization of ice cream is the establishment of a basis for a square deal between the manufacturers of ice cream on the one hand, and the dealers and consumers on the other hand.



Now a few words about flavors used in ice cream. Misinformation seems to have gone out from some of the dealers in flavorings, to the effect that you can't use synthetic flavors in vanilla ice cream. There never was a time since the passage of the food laws in the state of Wisconsin when you could make vanilla ice cream by the use of any other flavor than vanilla. That is not new to these standards. I think every one of you will agree that it should be so. In buying vanilla extract, would you consider it a square deal if the manufacturer sold you a fifty gallon barrel of vanilla extract made from the crushed shell of the vanilla bean? The consuming public has the same rights in purchasing that you have. So again in the manufacture of maple ice cream, maple and cane sugar is standardized. Maple syrup is standardized. It is an article of food known to the public, and certainly the public has a right to expect maple ice cream to be manufactured with maple sugar or maple syrup. If you cannot sell to your trade that product, if your trade must have a stronger flavored product, if they must have maple ice cream, sell it to them for maple ice cream in the same manner in which you buy that product, mapeline or imitation maple flavor.

In bringing my few remarks to a close, I want to tell you a very short story, and it is about a young protestant minister, who is about to be ordained. There was selected for the ceremony a pious old Scotch Presbyterian minister and he felt the importance of giving the charge to this minister and among other things he said to this minister, "If you lack piety, you can get that by prayer, if you lack knowledgt you can get that from the Bible, but if you lack common sense, the Lord have mercy on you."

Gentlemen, that applies to the ice cream business as well as every other line of business today. If you haven't the courage and the backbone and the integrity to make vanilla ice cream with vanilla extract, maple ice cream with maple syrup and maple sugar, and if your customers like tonka ice cream, or the more strongly flavored ice creams, and you lack the courage to put it in, the Lord have mercy on you.

I thank you.

Applause.

Fifth Edition

MAILED ON RECEIPT OF

$1.65

Contains Single FORMULAS that have made fortunes for the users.

CONTAINS THE WORLD'S EXPERIENCE IN

Ice Cream and Home-Made Candies

FOR THE CATERER — Fancy Ices, Frozen Fruits, Bombs, Sherbets, Parfaits, and Plain and Fancy Creams.

ICE CREAM MAKER — All that is known about Ice Creams, Ices, Fancy Fruit and Nut Creams, Brick Creams, "Condensed" and Gelatine Formulas.

CANDY MAKER — Takes the BEGINNER from the "A B C's" through the whole range of Popular Home Made Sweets.

The Chapter on "BRICK CREAM" shows how to blend Colors and Flavors, and so plainly that it is easy to follow. The "Guide" is used and endorsed by DAIRY AND DOMESTIC SCIENCE DEPARTMENTS, in many STATE COLLEGES, and by the entire profession is accepted as AUTHORITY. Contains 124 pages, copyrighted, and is PRACTICAL. The Formula for "Fortuna" Cream made a fortune for its originator, and has never before been published; the "Guide" is full of SECRETS. Will be sent postage prepaid upon receipt of $1.65. Address:

SUPPLY MEN WILL HOLD NATIONAL SHOW THIS YEAR.

Continued from page 6

Convention-and-Exhibition in 1922 will do more, in our opinion, than any other single thing.

Very truly yours,

THE ASSOCIATION OF ICE CREAM SUPPLY MEN,
ROBERTS EVERETT, Secretary-Manager.

"The opportunity to hold its convention in conjunction with our exhibition is certainly a courtesy and a convenience which we are happy to have the privilege of offering to the National Association," according to the executive committee of the supply men's organization.

The Association of Ice Cream Supply Men has recently placed application blanks for membership in the National Association of Ice Cream Manufacturers in the hands of every member of the association's salesmen's club together with printed information of the accomplishments, past, present and outlined for the future, of the National Association. According to the president of the association's salesmen's club, Thomas J. Stewart, the "more than 500 members are spreading the gospel of national association to the ice cream industry from Maine to California and are devoting themselves more and more heartily each month to this work."

"Did he moan an' sigh? Did he set an' cry an' cuss the
hurricane sweepin' by?
Did he grieve that his old friends failed to call when
the earthquake come and swallered all?
Never a word o' blame he said, with all them troubles
on top his head!
Not him! He climbed on top o' the hill whar stan' in'
room wuz left him still,
An' barrin' his head, here's what he said:
'I reckon it's time to get up an' git;
Thank the Lord I hain't had the measles yit."

SELECTED.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

ICE CREAM GOOD FOOD AND MEDICINE.

Dr. Royal S. Copeland, commissioner of health of New York City, is a friend of the ice cream industry. We quote from a recent statement by him:

"Have you ever been at your wits' ends to know what food to give a sick person? You feel he needs something to nourish him, but you just can't think what he could take. You want something he would enjoy, but you want to be sure it won't hurt him.

Ice cream is the thing.

During or after almost any fever you may give ice cream.

Of course there are some conditions where milk is bad. For instance, if the stomach is upset, milk should not be taken for a day or two. In the little gastric disturbances of children milk should be omitted from the diet.

Whenever milk is undesirable, ice cream is equally undesirable. But in every condition where milk is a proper thing to give, ice cream may be substituted.

Ice cream is loved by every child. As a dessert no food is better when given in reasonable quantities."

NATIONAL ASSOCIATION GETS INVITATION TO CLEVELAND.

The National Association of Ice Cream Manufacturers has been invited by the Association of Ice Cream Supply Men to hold its 1922 convention in Cleveland, Ohio, in conjunction with a national exhibition to be staged by the latter association. It is the plan of the supply men to put on just one exhibition this year and to make it a big one.

MANNING CATALOG IS OUT.

The spring issue of the Manning Catalog is now being sent to all manufacturers of dairy products who request it. It is a nicely gotten up booklet of 230 pages and is neatly indexed. The cover is done in a pale bisque shade for a background with a fine herd of Holstein cattle browsing on the banks of a creek. The horizon line is broken by hills and trees, altogether presenting a very inviting summer picture.

This handy catalog contains the prices and illustrations of nearly every piece of equipment used by the butter and ice cream manufacturer or milk dealer, and the Manning Manufacturing Company of Rutland, Vt., will gladly send a copy to anyone upon request.

CHAMPAIGN COMPANY PURCHASES MATTOON CREAMERY.

The Champaign Ice Cream Company of Champaign, Ill., has purchased the Mattoon creamery at Mattoon, Ill., and took possession of their new place March 1st.

They will erect a modern plant and will install all new, modern machinery for refrigeration and other machinery that is necessary to carry on the ice cream, buttermaking and milk business.

D. L. Huxtable is manager of the Champaign, Ill., plant.

An advertisement placed in "The Review Want Department will put you in touch with just the kind of help you are looking for. Give "The Review" a trial —it's the best way to get results.

COST OF ADVERTISING CAMPAIGN ONLY HALF CENT A GALLON.

In the national advertising campaign for the ice cream industry which is being discussed, there are hundreds of details which must be cared for before the campaign proper can be started and considerable hard work is being done in this direction.

We made mention of this proposed campaign in the February issue of The Ice Cream Review in the article entitled "Kansas Ice Cream Manufacturers' Convention Well Attended." We stated that Henry W. Stern of the A. Daigger & Company, had given his views on this national advertising campaign for the ice cream industry. While we had specifically in mind that Mr. Stern had made mention that at an estimated cost of about one-half a cent a gallon and securing the co-operative efforts of 80 per cent of the ice cream manufacturers, an active campaign could be carried on for a year, we worded the article "not to exceed 1 cent per gallon."

You'll make better ice cream if you get the "Ice Cream Review."

Bright attractive MASTER METAL wrappers will help your Eskimo Pies to quick success

MASTER METAL makes a distinctive, sales winning wrapper for the wonderful new ice cream dainties, Eskimo Pies. It is the most brilliant, crisp and durable foil that is made.

MASTER METAL foil wrappers are taking an active part in the sweeping success Eskimo Pies are making North, South, East and West—the most phenominal, whirlwind success the ice cream world has ever seen.

We have the resources and equipment to supply you with any quantity of Master Metal wrappers on short notice.

If you are the first to manufacture Eskimo Pies in your locality, Master Metal foil wrappers will start you off strong. If you have competition, these wrappers will make your product the most outstanding in appearance.

Information concerning licensing rights to manufacturer Eskimo Pies can be secured from the patentees, Russel Stover Co., Mallers Bldg., Chicago.

Some one in your city will make big money introducing Master-Metal-wrapped Eskimo Pies. Why not be the one?

LOUISVILLE KENTUCKY

THE RIGHT KIND OF COLD STORAGE DOORS FIGURE PROMINENTLY IN THE PLANT.

New Davis-Watkins Chicago Headquarters

After April 1st, 1922

IT WILL occupy the whole seventh floor of this splendid building at 710 West Jackson Boulevard, at the corner of Des Plaines Street. Over sixteen thousand square feet of floor space, half of which will be devoted to the executive offices, and the other half to the Chicago Sales Branch.

The rapidly increasing flow of machinery business through the Davis-Watkins organization makes this move imperative and advisable. The management is taking an active interest in the larger affairs of the industry, which necessitates locating these men in Chicago. And the sales branch needs the special advantages of Chicago's facilities in properly caring for the increasing trade of customers.

The location is handy to the famous Chicago Loop district. It is convenient to the hotels and depots. Many supply houses and dairy manufacturing concerns are located in the immediate neighborhood. Halsted Street, the great connecting link between the north side and south side, and running right through the west side, is close at hand. This offers excellent opportunity for the proper service of Chicago customers.

The rapid growth of the Davis-Watkins organization has been due to the co-operative effort of many men, properly directed. It has been steady, and always on the up-grade. Men of accurate vision have planned each move carefully. Then other men have been ready and willing to carry the idea to completion. From a small beginning, just a few years ago, these men have one of the largest and strongest organizations of its kind in the world.

No such concern as this is possible except one which has on its books thousands of satisfied customers. For the most part the business consists of standard dairy machinery and cans. The line includes machines and equipment for practically every purpose in connection with the proper handling of milk. The customers include milk dealers, ice cream factories, creameries, condensories, etc. Some things, such as cans, strainers, small butter churns, etc., are sold to dairy farmers.

The present construction of Davis-Watkins equipment is the result of many years of perfecting and improving on the original inventions of many men. The speed with which this has been accomplished stands as a wonderful credit to the men who have put it over. They have been busy men, who have done a remarkable work for the industry. It has resulted in cutting the cost of handling, and at the same time made sanitation possible in many places where it did not exist before. The benefit and saving to the public has been enormous.

The good selling of the sales organization has made this possible; but the excellent work of the engineers and factory men have accomplished the real job. Without customers they could not do work of this kind; so, it is really fair and right that the many and discriminating customers of this great concern be awarded the real credit, for they have helped by buying the goods. They have made money out of the transaction, but the way has been tedious because of imperfections which have had to be adjusted by the engineers and factory men.

It is funny just how this whole thing runs around in a circle when one tries to analyze it. Who pays, and who deserves the credit, are problems which have dumbfounded the most able minds of all ages. In these days of co-operative effort the problem is even more difficult of solution than ever before. Doubtless we have all contributed, so we all deserve credit and profit.

In opening this new office and sales department, the

E. A. PHILLIPS,
Manager Jersey City.

C. A. WILTSEE,
General Sales Manager.

H. G. DAVIS,
Manager Chicago.

W. C. DAVIS,
President.

EVERY organization is strong in direct proportion to the individual strength of the men directing its activities, and coming into constant contact with its customers.

The rapidly increasing growth of the Davis-Watkins Dairymen's Mfg. Co. is the direct result of the work of these executives whose pictures we show on this page.

Back of these men, and co-operating with them, are many individuals; all intent on the work of serving customers to the best of their ability.

T. L. VALERIUS,
Vice-President.

G. A. CHAPMAN,
Manager Kansas City.

M. A. KESSLER,
Manager Denver.

A. N. HENDERSON,
Manager San Francisco.

Davis-Watkins organization is making another move which must benefit the industry. They are entering one of the greatest dairy centers of the world with the idea of progress ever foremost in their minds. Why are they doing it? Simply from selfish motives, that they may better serve customers and better help the industry. They will profit, and so will the whole dairy industry of the middle states. They will sell more equipment, and this will help more customers to better serve their trade. Even the producer, selling milk to the Chicago market, will receive his share of the profit.

After April first these men will be in a position to welcome you in these new offices. Many new labor saving machines will be on display in the display room. Things of interest will be there for you to see. When you visit Chicago make it your headquarters.

THE IMPORTANCE OF HIGH CLASS FREEZER OPERATORS.

By N. M. Thomas in Cherry Circle.

No department in our ice cream plants is today receiving the same consideration and attention as are the freezing room and those things which are essential to it. Many of our ice cream manufacturers have, in the past, paid very particular attention to their office and to the delivery and mixing departments. They have improved and run them along constantly increasing, efficient lines, while the freezing room has been allowed to run itself. The thing which has been considered essential to a successful freezing department, in the modern plant, has been a white tile room, a well drained floor and a battery of modern freezers. The last mentioned and most essential equipment was apparently purchased with the thought in mind that the manufacturer who made and sold them equipped them with brains, and nothing further was to be done but place them in sanitary, well-lighted surroundings with any pick-up employee, around the plant, as operator in chief.

Laboratories, chemists in charge of same, glass-lined holding vats, high-grade coil pasteurizers and holders, expert blending and testing have become recognized as a necessary adjunct to the production of high-class, uniform ice cream. The result has been that a combination of high-class, modern equipment, combined with expert laboratory work, has enabled the ice cream manufacturer to standardize his mix and blend it in such a manner that from the standpoint of producing a mix ready for the freezer he has left little to be desired.

During the past few years this end of the manufacture of ice cream has developed to a degree, which in many respects is out of proportion to the progress made in other departments. A certain proportion of this has been nullified by careless freezing methods and lack of the same care and scientific methods applied to the freezing of the ice cream as has been given to the preparation of the ingredients before they reach the freezer.

Many manufacturers have had brought home to them, during these days of high costs, that more money is made and lost in the freezing room than in any other department of the factory. Flavor, texture, uniformity, yield, appearance of your package and other smaller but equally as important factors in the production of your finished product are entirely in the hands of your freezer operators. They can nullify all the work of your elaborate equipment in your mixing room. All the work of your laboratory is so much useless effort unless your freezer operator exercises the same care with his process as the chemist did in the laboratory.

There is positively neither sense nor logic in any plan of production in an ice cream factory which standardizes the amount of solids fat and not fat of sugar and flavor in your mix to an exact proportion each day and then allows of a laxity of method in the finishing or freezing process which produces cans of ice cream of equal size, which vary in weight from one to five pounds. Neither is there any excuse for one can of frozen ice cream to have a smooth velvety texture and another to be coarse and grainy, yet both made from the same standardized batch of mix. There is positively as little excuse for one shade of strawberry ice cream on one day and a lighter or darker one the next day or even worse than that—two shades in one can—as there would be for your chemist to have 20 per cent solids not fat one day and 10 the next. Yet all of the things as fixed standard factors in the production of your finished product are necessary if you are to have a trade-winning, trade-holding product. Competition will become keener as the days roll by, and the ice cream man, who stays and grows and whose bank balance stays and grows, will be the one whose product has not only the quality, but who is able to maintain that quality as nearly uniformly as possible.

You would not consider for one moment the placing of a truck driver or ice handler in your laboratory. Then why in the freezing room? A freezer operator today in a large ice cream plant should know not only how to turn on and off certain levers, pull certain valves and put covers on cans—to be an effcient operator he should have the ability to study the production of ice cream as it goes through his department and in its relation to all other departments and also as it affects the ultimate consumer—the one who buys the product he produces and who pays his wages. He must have the ability to search

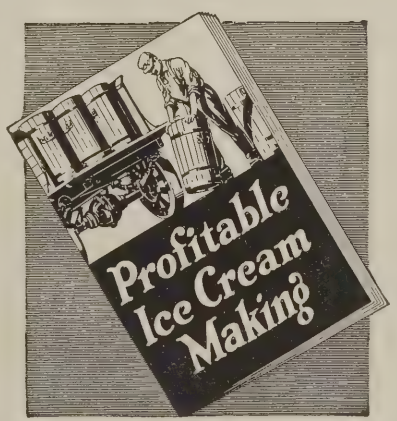
out the method, in his individual plant, which will produce the best goods under the conditions with which he must operate. Because John Jones makes good ice cream with a 27-quart batch in a 40-quart freezer with zero brine in one plant is not sufficient proof that the same thing can be done in some other plant under different working conditions with a different plant layout, etc. Just as every automobile, every engine—although they may be produced in as nearly uniform method as possible—have their peculiarities which an observant driver or engineer soon discovers and utilizes to his advantage, just so each plant has some feature, some form of layout which requires special attention in order to get the desired result.



Your freezer operator should have the ability to know refrigeration and its application to and effect on the product he is making. He must know what temperature and what brine pressure produces certain results and why. Why certain temperatures and pressures are better for certain flavors or mixes and not so good for others. A million and one things, affecting the freezing of ice cream, which are of vital importance, will be overlooked by the careless operator, which in the end mean dollars to you and many times are the things which stand between success or failure.

Use the same care and discretion in selecting your freezer operators as you would in selecting a bank president to run your bank. Give him the equipment and other necessary things to produce a uniform, standardized, finished ice cream, and look to him for the same exactness that you expect of your chemist, nad you will have taken one more step toward success.

"PROFITABLE ICE CREAM MAKING."

A new and attractive forty page book is just off the press which will undoubtedly prove of great benefit to the ice cream manufacturer, explaining as it does many ways in which he may cut his costs and at the same time improve his product.

The contents consist of nine articles and a number of working tables and simple tests by N. M. Thomas, nationally known ice cream expert, and tell the story of ice cream in a direct style, entirely devoid of frills and theory.

If you will mail one dollar to the J. G. Cherry Company, Cedar Rapids, Iowa, a copy will be mailed you postpaid, promptly.

⚜

BILL FOR FAT STANDARD IN ICE CREAM INTRODUCED.

A bill to establish a fat standard for ice cream in New York State was introduced by Senator Mortimer Y. Ferris, as an amendment to Section 50 of the New Farms and Market Law, which, in its entirety, was enacted at the present session of the legislature.

The sale of ice cream which did not contain at least 10% of milk fat and at least 20% of milk solids was prohibited by the original bill. The bill was referred to the Committee on Agriculture of both houses of legislature. A hearing on the bill was arranged for by a joint committee consisting of Wm. Palmer, Hoefler Ice Cream Co., and president of the New York State Association of Ice Cream Manufacturers; E. B. Lewis, J. M. Horton Ice Cream Co.; V. E. Hovey, International Ice Cream Co.; S. T. Nivling, Rochester Ice Cream Company, and C. E. Kilburn, Kirk-Maher Co., representing the State Association. This meeting was held in Albany on February 22nd. The case for the manufacturers was presented by their representatives, and the legislative committees agreed to report amendments to the bill as suggested by the manufacturers, after a full discussion was held on the subject. The bill is now in its final passage, action having been taken in both the Senate and Assembly. It will undoubtedly become a law and will be effective on July 1, 1922.

The bill as amended, prohibits the sale of ice cream which does not contain at least 8% of milk fat and at least 18% of milk fat and milk solids not fat combined, except when ingredients of ice cream shall include eggs, fruit, fruit juices, cake confections, cocoa, chocolate or nuts, such reduction in the percentage of milk fat and milk solids not fat as may be due to the addition of such ingredients shall be permitted or allowed, provided the product then shall contain at least 6½% of milk fat and at least 15% of milk fat and milk solids combined.

The Threat.

Overheard—"Yus! an' I says to 'im: 'You shove any more water in my milk an' I'll tike it down ter town 'All an' 'ave it paralyzed by the local Anarchist.'"—Pearson's Weekly (London).

RULES FOR BOARDS OF DIRECTORS.

1. Remember that ice cream can be made in the home, so there is nothing to be known about it.

2. Anybody who says anything about chemistry, bacteriology, engineering, refrigeration, or special machines, is merely talking technical to show off his learning.

3. The less you know about details and processes, the better you will be qualified to pass on important purchases and questions of policy—the detail men "Cannot see the forest for the trees."

4. Do not buy any expensive machinery—the big fellows had none when they started, years ago. They are big enough to afford luxuries now.

5. Remember that "labor saving" machinery is only to let people stand idle part of the time instead of working. You pay for the time while they are looking important.

6. If anybody in the concern asks to have money spent on equipment for the plant, he is in league with the salesmen.

7. Do not buy anything as big as the salesmen tell you to get—they need the commission. If the plant does not make as much stuff as you expect—"fire" the foreman.

8. Do not listen to anybody who tells exact information about the business—listen to the people who talk nice.

9. Buy only bargains in machinery and supplies—all prices are merely a basis for bargaining.

10. Always pay the lowest wages in town—the help won't earn what you pay them.

11. Always require the longest hours in town and drive the men on the run all day, seven days a week—they are "hard boiled" and can stand it.

12. Never go through another ice cream factory, laundry, or large bakery—you might learn what machinery is for.

Moral—Follow these rules and you will surely wreck the business the first year.

A FOREMAN.

⚜

1921 ANNUAL REPORT OF NATIONAL DAIRY COUNCIL NOW AVAILABLE.

The report of the activities of the National Dairy Council during 1921 has been compiled and printed into a very attractive twelve-page booklet, copies of which can be secured by writing to the National Dairy Council at 910 S. Michigan Avenue, Chicago.

This report shows some very wonderful achievements for the dairy industry during 1921. The results accomplished by the council show that the work is rapidly growing and that there is a great need of every person in the dairy industry getting back of the council movement.

The council has proved itself a worthy organization and an organization which every man engaged in the dairy industry will find valuable to support.

NEW EASTERN REPRESENTATIVE FOR MOJONNIER BROS.

Mojonnier Brothers Company, Milk Engineers, Chicago, announce the appointment of Mr. W. E. Larkin as their eastern representative with headquarters at 490 Sanford Ave., Flushing, Greater New York.

W. E. LARKIN.

Mr. Larkin is well acquainted with the milk men in the east having called upon them for the past several years and needs no further introduction.

Mr. Larkin has lived in the east practically all of his life and is well acquainted with the aims and ice cream and milk policies of the eastern men.

PERSONALS.

Chas. M. Anderson, president of the Specialty Brass Company of Kenosha, Wis., and Albion, N. Y., was a welcome caller at The Ice Cream Review office recently.

Mr. Anderson is on the police board in the city of Kenosha, and came up to Milwaukee as one of a committee selecting a new car for the Kenosha police department, and we expect the next time he visits The Review office his Pierce Arrow will lend distinction to our block by being parked at the curbing.

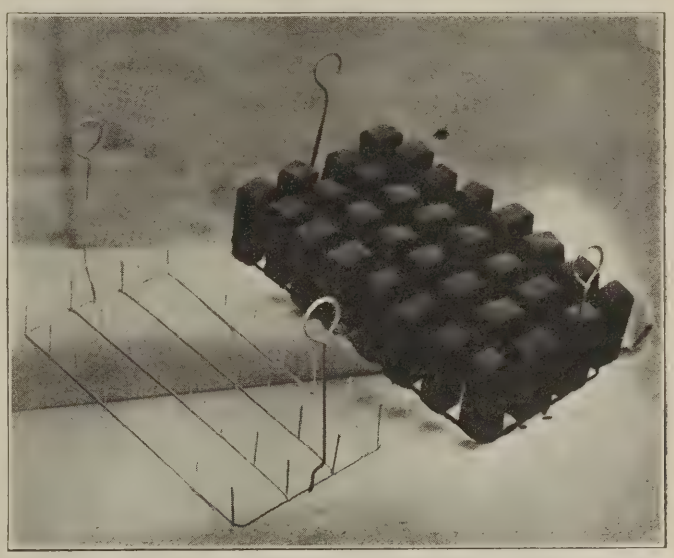
An extended trip to New York and other eastern cities is being contemplated by Mr. Anderson and he expects to leave shortly. Much success and call often.

* * *

Frank W. Lohr, with the Grand Rapids Cabinet Co., Grand Rapids, Mich., was a caller one day recently. Mr. Lohr is an enthusiastic ice cream man and a very pleasant visitor. Come again.

FREEMAN DAIRY COMPANY MAKES EXTENSIVE PURCHASES.

The Freeman Dairy Company of Flint, Mich., has made extensive purchases of several ice cream companies. They have just taken over the Cadillac Ice Cream Company of Cadillac, which operates a plant also at Mount Pleasant.



The Petoskey Ice Cream Company of Petoskey, and the Jackson Ice Cream Company of Cheboygan, have also been purchased by the Freeman Dairy Company. Two new plants are being opened at Jackson and Bay City. The company also operates a milk and ice cream plant at Saginaw. The ice cream mix for all these plants is made at Flint.

These extensive purchases will make the Freeman Company among the largest ice cream manufacturers in the state of Michigan. Leonard Freeman is the president of the company.

DRYDEN CORPORATION USES SIMPLE DIPPING DEVICE WITH SUCCESS.

The accompanying photo illustrates a simple device which is effective for dipping coated ice cream bars. This contrivance was effected by E. W. Morrison for the Dryden Corporation of Oakland, Calif., and has been used by them with success.

These racks can be made to hold three or four dozen bars at a time, and cost about 35c each. The illustration shows a sample made of black iron wire, welded by an electric spot welder. The finished rack was dipped in block tin.

The bars are placed on the peg on end, about half way down, and do not touch the frame. This allows the chocolate to completely cover the cream. This simple device has proved to be a rapid method for dipping. The bar is smoothly covered with only one tiny hole which can be easily filled if necessary.

This suggestion may be of help to the manufacturer of coated ice cream bars in working out a similar device, and may be improved in detail to meet the needs.

NEW REFRIGERATION CATALOGUE.

The Creamery Package Manufacturing Company announce the publication of a new 40-page catalogue devoted to refrigeration machinery in general and to the CP line of horizontal machines in particular. This book is abundantly illustrated with various types of refrigeration machines and installation views. In additon, it has several tables of particular interest to present and prospective users of refrigeration and they are invited to write for a copy. It will be sent without charge and without obligation, if this paper is mentioned.

The following story appeared in a recent bulletin of Rochester Credit Men's Association:

"The doctor coughed gravely. 'I am sorry to tell you,' he said, looking down at the man in the bed, 'that there is no doubt you are suffering from smallpox.'

"The patient turned on his pillow and looked up at his wife.

" 'Julia,' he said in a faint voice, 'if any of my creditors call, tell them that at last I am in a position to give them something.' "

The C-T Bantam, Especially Adapted to Ice Cream Delivery

A frame, a battery, motor-and-wheel driving units, steering gear, all built with the utmost attention to structural details—that's the C-T Electric Truck.

But simple as it is, for city deliveries and frequent stop routes there is no more dependable or more serviceable delivery equipment in use today.

Less parts mean economy of operation, low maintenance cost, easy driving and longer life.

In these days, your profits depend largely on what you save, not on what you earn. Look into your transportation costs. If you are not using electric trucks on your city routes there is a chance to save many dollars and at the same time increase the efficiency and dependability of your delivery service.

C-T Electric Trucks, with their high serviceability and low upkeep are today giving complete satisfaction to hundreds of users who have searched for and found a way out of high operating costs.

Investigate C-T Electrics *now*. Let us send you complete information on your particular problem.

Austin built Telling Belle-Vernon manufacturing plant and power house at Wellington, Ohio.

It's the Modern Plant That Makes the Profit

Properly planned buildings equipped with the most modern machinery for ice cream production give the manufacturer competitive advantages as well as increased profits. The old type of plant cannot hope to meet competition and its profit opportunities are less each year.

The new and modern plant keeps abreast of the ever increasing demand for better ice cream and other dairy products. Furthermore, it fully complies with laws governing the manufacture of food products. It is sanitary. It is a good advertisement.

With present low building costs and greater production from the building trades workmen, Austin engineers can give you plans and estimates that will give you a modern plant in every respect and at the same time *protect your investment.*

Over 50 years of engineering, building and equipment experience can be applied to your problem through the Austin Method.

Austin can help you whether you need an ice cream plant of reinforced concrete type, a new power house and its equipment, or a clear span garage. Special literature sent upon request.

Phone, wire, or use the coupon. No obligation is involved.

APRIL 1922

BULLETIN OF EVENTS

National Dairy Show, Minnesota State Fair Grounds, Minneapolis--St. Paul, Minn., October 7-14, 1922. W. E. Skinner, Secretary, Suite 222, 910 So. Michigan Ave., Chicago, Ill.

National Association of Ice Cream Manufacturers. 22nd annual convention, Cleveland, Ohio, Hollenden Hotel, October 16th, 17th and 18th. N. Loewenstein, 155 N. Clark Street, Chicago Secretary.

WE HOPE that you will enjoy the colored supplement in this issue devoted to the chocolate coated ice cream subject. We have gone to considerable effort to gather the information contained therein, but we shall feel repaid if it carries to you a message that will help you in your business. There is nothing more interesting to the ice cream manufacturer than the experiences of others. The chocolate coated ice cream industry is so new to most of us that it is impossible to go back very far in drawing upon the experiences of others in the industry. We have been delighted with the co-operation we have enjoyed in our efforts to collect information on this timely subject. We are indeed indebted to the many progressive men in the industry who have so generously responded with the information which they alone possess. When you have read the special supplement lay it aside for future reference.

ANNOUNCEMENT is made in this issue that the 1922 convention of the National Association of Ice Cream Manufacturers will be held in Cleveland, Ohio, in connection with the exposition to be staged by the Association of Ice Cream Supply Men.

Cleveland is admirably located for such a show and we want to tell our readers right now that when they go to Cleveland to attend their annual convention they will find nothing left undone to make their visit pleasant and profitable. The members of the Association of Ice Cream Supply Men will show them a good time, they will see a good display of ice cream machinery and supplies and they will have a good convention.

Inasmuch as the Cleveland Exposition and convention follows so closely upon the heels of the National Dairy Show at the Minnesota State Fair Grounds, opportunity is afforded visitors from the South, East and West to visit both on the same trip. This is particularly pleasing to the traveller from a distance who wants to visit both places. It is going to mean a pretty quick jump for the exhibitor, who wishes to display his wares in both places, but he will find the way of doing it, even if he has to engage an aerial taxi.

We hope that readers of The Ice Cream Review in large numbers will plan to attend the National Dairy Show and also the convention and Exposition in Cleveland. The National Dairy Show will lose none of its interest for the men engaged in promoting the dairy industry in general and the ice cream industry in particular.

KANSAS may support fewer millionaires than some of her sister states, but when is comes to progressive, wide-awake ice cream manufacturers she refuses to take a back seat.

The ice cream manufacturers of Kansas are not content to hold one convention a year. District meetings, similar to those held in some of the other states, are features of the year around work of the Kansas Association of Ice Cream Manufacturers. Such a meeting was held the latter part of February, in Manhattan, at which time an ice cream scoring contest was conducted. The scoring contest was in charge of Professor Olson, of the Kansas State Agricultural College. Forty-one packers of ice cream were entered in the contest and about 50 ice cream manufacturers attended the meeting. You will be interested in reading a report of the scoring contest on page 64 of this issue.

THE ice cream manufacturer, who makes a consistent effort to build up an effective organization, always gets paid handsomely. The delivery man should be more than an order taker. He should be a real salesman. By the right kind of coaching, he can help the sales department build up sales. He can make the retailer like to do business with his company. If he is wide-awake he can give suggestions to the retailer, he knows what other retailers are doing and he knows what methods

are getting the best results. He can make himself so solid with his trade that the customers of his firm will be constant customers and better ones.

Different ways of building up the efficiency of his employees suggest themselves to the progressive manufacturer. Possibly the most popular plan is to hold round table discussions. The different employees contribute their experiences and are able to help solve each other's problems. Such discussions not only improve the knowledge of employees, but they engender a wholesome spirit in the organization. Each man feels that he is employing the best known methods in his work and that he is backed up by his superiors. An occasional banquet and evening's entertainment at the expense of the firm is a mighty good investment.

⚜

IN THIS issue we conclude the report of the Illinois Association of Ice Cream Manufacturers' Annual Convention. Among several good things contained therein are some remarks by Mr. H. J. Credicott, of Freeport, Illinois, to which we invite special attention. Mr. Credicott told the delegates some real facts about the licensing and inspecting of dairy plants in Illinois. "Harley" was at one time a dairy inspector in a state where inspection amounted to something and knows what he is talking about. Be sure to read his remarks.

⚜

IT MAY be of interest to readers of The Ice Cream Review to learn that the subscription price of $2.00 per year does not pay for the paper on which it is printed. This leaves less than nothing, so far as subscriptions are concerned, with which to pay for the printing, postage and other items incident to the publication of such a large magazine. Our advertisers, by their liberal and unprecedented patronage, are making possible the larger and better paper which you are enjoying.

We don't want any one to gain the impression from the above that we are not anxious to get new subscribers. Although it costs more money to buy the unprinted paper than we receive for a subscription, we welcome new subscriptions—the more the better. The more paid subscribers we have the better we can serve the great industry in which we are all interested.

⚜

THE ice cream manufacturer holds a more responsible position in the business and social life of his community than in years gone by. When ice cream was looked upon merely as a confection or dessert, suitable only for extremely hot weather conditions, he carried little responsibility and was considered by other business men as being in mighty small business. The development of his business during the past very few years has attracted the wonder and respect of folks in every walk of life. His manufactured product, while losing none of its popularity as a delightful dessert, has been accepted as an important food article, valuable at any and all seasons of the year. As a producer of this important food his responsibilities have grown in accordance with its larger use, and he is wise who meets this responsibility by making his product as pure and wholesome as it is in his power to make it.

⚜

WE CONGRATULATE the ice cream manufacturers of North Carolina on the resolution adopted at their last convention relative to the use of substitutes for butterfat in the ice cream mix. Here it is:

> "Resolved, That the use of any fat or oil not derived from milk, as a substitute for the whole, or any part of the milk fat in ice cream, is not a legitimate or proper variation of the ingredients which may be used in the ice cream mix. Variation, selection and modification among the usual ingredients, are desirable in our efforts to meet the desires and even caprices of our customers, but we condemn the use of any substitutes for the vitamine bearing milk products."

Not many years ago we attended a meeting in Washington, at which time the Agricultural Committee of the House was considering an oleomargarine bill. Representations were made before that committee to the effect that the interests of the southern states were opposed to the interests of dairying states. To adopt such a resolution as the one quoted above proves that they are not only good business men, but that the old claim that the people of the south are opposed to dairying is unfounded.

⚜

FOLKS in the ice cream business who are sometimes tempted to look with favor upon the practice of substituting other fats for butterfat would do well to remember that ice cream largely owes its claim to favor as a food product to the fact that it is a dairy product. Substituting other materials will render it an entirely different product and it will not be ice cream. This fact, together with their love of fair play, is what prompted the officials of the National Association of Ice Cream Manufacturers to issue a warning several months ago to the effect that a member guilty of such a crime would be expelled. Don't substitute, and don't let anybody else do it. Report any suspicions you may have to the health authorities. Let's keep the business as pure as ice cream should be.

⚜

YOU enjoy reading articles in The Ice Cream Review relative to improvements made in various ice cream plants. You may have made some changes or improvements that would make interesting reading for others. Write us and tell us about them. Have you increased the capacity of your plant? What new apparatus has been installed? What plans are you making for a bigger summer season than ever before? Remember this all makes interesting reading and we will be glad to give it space. Please let us hear from you.

Offering Better Service to Texas Association Members

By A. J. WHITE, Secretary, Texas Ice Cream Manufacturers' Association, Mistletoe Creameries, San Antonio, Texas

WHILE the Association in Texas has been successful in accomplishing great good in the past, we believe that this organization, with the assistance of the Directors and individual members, can be placed on a more efficient basis and contribute in a great measure toward assisting the ice cream industry in Texas to pass through this period of re-adjustment more successfully. We are safe in saying that, as a whole, everyone is of the opinion that the ice cream business in Texas is in a rather precarious condition. If the Association means anything at all, it should certainly be a help to its individual members.

The Mistletoe Creameries are willing to furnish office help and supplies, so the only expense to the association in any undertaking that might be decided upon would be for stationery and postage. As a basis for enlarging the scope of work of the Association, we wish to suggest the following as lines which we can pursue:

To bring about a closer bond and greater confidence between members of the association.

To discuss and emphasize harmful trade practices, with a view of eliminating them.

Exchange of information freely on costs of production of ice cream, with proper depreciation to be charged on delivery and manufacturing equipments.

If possible, standardize certain items of cost methods in various plants.

Analyze costs and expenses, and eliminate the unnecessary expenditures of money, as such items are a burden to the industry as a whole and must be paid for by the manufacturers, through no profit to the manufacturer or by a higher price to the consumer.

To make the Association a medium of exchange of ideas. In order to accomplish this, frequent communication would be necessary to all members, part of which could take the form of a question box if it were deemed best. Any information that we did not have could be readily obtained from outside authorities.

To bring about closer relations between the supply men and members of the Association with, perhaps, the ultimate purpose of inducing the supply men to give discounts on all goods purchased at the convention.

To keep up interest in the Association throughout the year so that the attendance at the convention will be greatly increased, making it possible, perhaps, to secure some hotel concessions and reduction in railroad rates. This would enable some of the manufacturers to attend the convention because of these savings and advantages that would be afforded them. By enlisting the services of the supply men, we could also depend upon them to keep up the interest of the manufacturers throughout the season.

The foregoing are a few of the subjects to which we can afford to give careful thought and attention. They will, no doubt, suggest other questions that would call for the consideration of the Association.

From the trend towards greater economies, the thought has been advanced to bring about a saving in city deliveries where re-icing service is rendered and to prevent loss of containers in country shipments. It has been the policy heretofore to give icing service in the winter at the same cost per gallon of ice cream sold as in the summer. Some stores sell enough ice cream during the winter to justify this expense, while the great majority of stores sell scarcely any cream; but because of the small cost to them they continue it in stock, and the ice cream manufacturers at a great expense serve them in anticipation of their increased business during the coming summer. No doubt these conditions contribute more to the burden that the ice cream industry carries than does any other cause. If this is a great unnecessary expense, someone must pay it, and needlessly. The price of ice cream could be made lower if this re-icing service were rendered on a cost per hole-packed basis or so much per pound ice delivered, including salt. The larger user of ice cream would be benefited thereby, and an expense to the industry reduced.

On country shipments a tub may make only five trips a season, others as high as fifty, while some meet an untimely end on the first trip and disappear completely from the land of the living. Is it just to make a good customer who returns his containers promptly pay for the losses incurred by careless buyers who allow cans and tubs to be used around their towns for garbage cans and kindling wood? A charge, say $5.00 each, can be made for tubs to country shippers, and once the custom is established, a manufacturer who fails to make such charges will find his bank account gone, and his creditors owning the plant, as the price of ice cream would gradually seek a lower level, based on the savings effected through less loss and greater service from the container. If anyone would then refuse to charge for containers on country shipments, he would come to his end that much sooner.

Such a plan would work no hardship on the legitimate dealer who co-operates with the manufacturer, as he would simply render an invoice for $5.00, together with the express receipt attached, bearing the number of the tub returned, and his responsibility would cease immediately. The ice cream manufacturer would then see that the return tubs were properly checked out of the express office. If the express office were negligent in getting the tubs returned, he would have good grounds for registering a strenuous complaint against the District Superintendent of the Express Company. If such a practice were in vogue, you would see no tubs and cans standing around the express offices in small towns simply because the express agent did not seem so inclined, or it wasn't convenient for him to put them on the train. Such a scheme would also bring about a condition whereby the dealer, as well as the manufacturer, would attach more value to a container, and less loss would result therefrom.

The ice cream manufacturers have a moral obligation to the public to eliminate needless expenses in waste wherever they exist. If, by close co-operation, the cost of

PATENTED.
The Electric Weld Ice Cream Can.

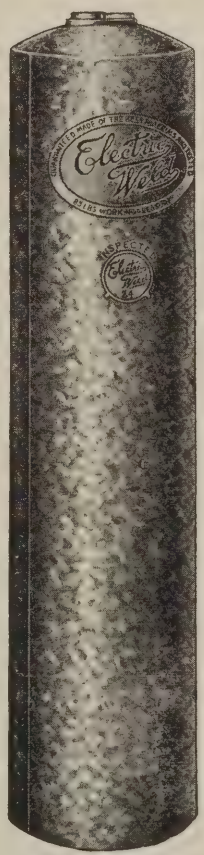
should be judged on a basis of the ratio of cost to service. The can that makes the most trips for the least cost is cheapest. We have other important features.

One-Piece Construction

These cans may be retinned at a saving of 20% over the old type soldered can!

THE GUARANTEED CAN

1 This company will guarantee their cans not to leak. We know how reliable welding is.



2 They will never require solder.

3 Each can is carefully examined and tested.

THE WEIGHT is in THE PLATE

That due to the better construction of our can and the superior mechanical methods, we save 6 to 8 oz. by not using solder, and save practically the same weight by doing away with laps of metal and unnecessary rivets.

Save weight by shorter and more compact chime construction. Why pay for unnecessary weight? Therefore, when it is claimed we have a "light can" we can answer this by saying the superior mechanical methods of our construction makes this possible.

We manufacture 1000 range boilers a day.

A Cheap Can Only in Price

This is a cheap can in price only. It is cheap because of our efficient methods of manufacture and because of our tremendous production.

NO RIVETS—NO LEAKS, the Electric Weld principle in the manufacture of hundreds of thousands of range boilers, applies to our ice cream cans.

manufacturing and delivery of ice cream could eventually be reduced, say 20%, the public would be able to buy cream for proportionately less money, and the consumption would be increased to a far greater volume than exists at this time.

NATIONAL DAIRY SHOW SIXTEENTH ANNUAL EXHIBIT SPACE SALE.

The sixteenth annual sale of space to the National Dairy Show exhibitors was held in the Auditorium Hotel, Chicago, Thursday, March 23rd.

One hundred and four people sat down to dinner together, under the auspices of the National Dairy Club, with Mr. W. C. Davis as chairman of the day. After the tables were cleared the chairman announced that as the most important matter before the meeting was the sale of the Show space he would do away with all preliminaries and turn the meeting over to the manager of the Show. Mr. Skinner made some announcements regarding the organizing of Minnesota for helpful work to make the Show a success this year, stating that Governor Preus of that state had accepted the chairmanship of the state organization, and that everyone up there was enthusiastic over the show coming back, and that North and South Dakota and Iowa had asked to have a similar organization perfected in their states, which would be done the week of March 26th.

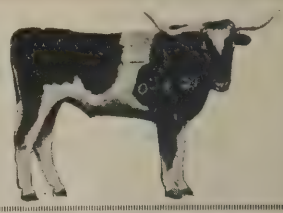
The manager then proceeded to inform the exhibitors that in conformity with their request of January 10, the exhibitors had all been placed as near as possible with their desires as to location and quantity of space, and that exhibits of kind had been placed in certain sections. He then read from a plat, just where each firm was located, and on concluding the reading of the plat, there were only requests from a half dozen to change from the space assigned to them, which was easily accomplished, and the clean-up showed that practically all the floor space and about half of the Mezzanine floor had been taken. There are some eight spaces still available on the ground floor, which will enable all exhibitors to yet get in near their old locations.

The meeting was harmonious, and everyone seemed to have the one idea of adapting themselves to what would be best for the Show and the industry.

TRANSPORTATION OF EMPTY ACID CONTAINERS.

New amendments are announced to the provisions governing the transportation of empty containers previously used in the shipment of inflammable articles.

Regarding glass containers they read as follows: "Empty Carboys, previously used for the shipment of corrosive liquids, when presented to carriers for transportation in carload and less-than-carload shipments, must be thoroughly drained. Whenever practicable they should not be loaded in car containing valuable or perishable freight."



"Empty bottles previously used for shipment of nitric acid or nitric acid mixtures should be securely stoppered."—Bottles.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

TEXAS LONGHORNS

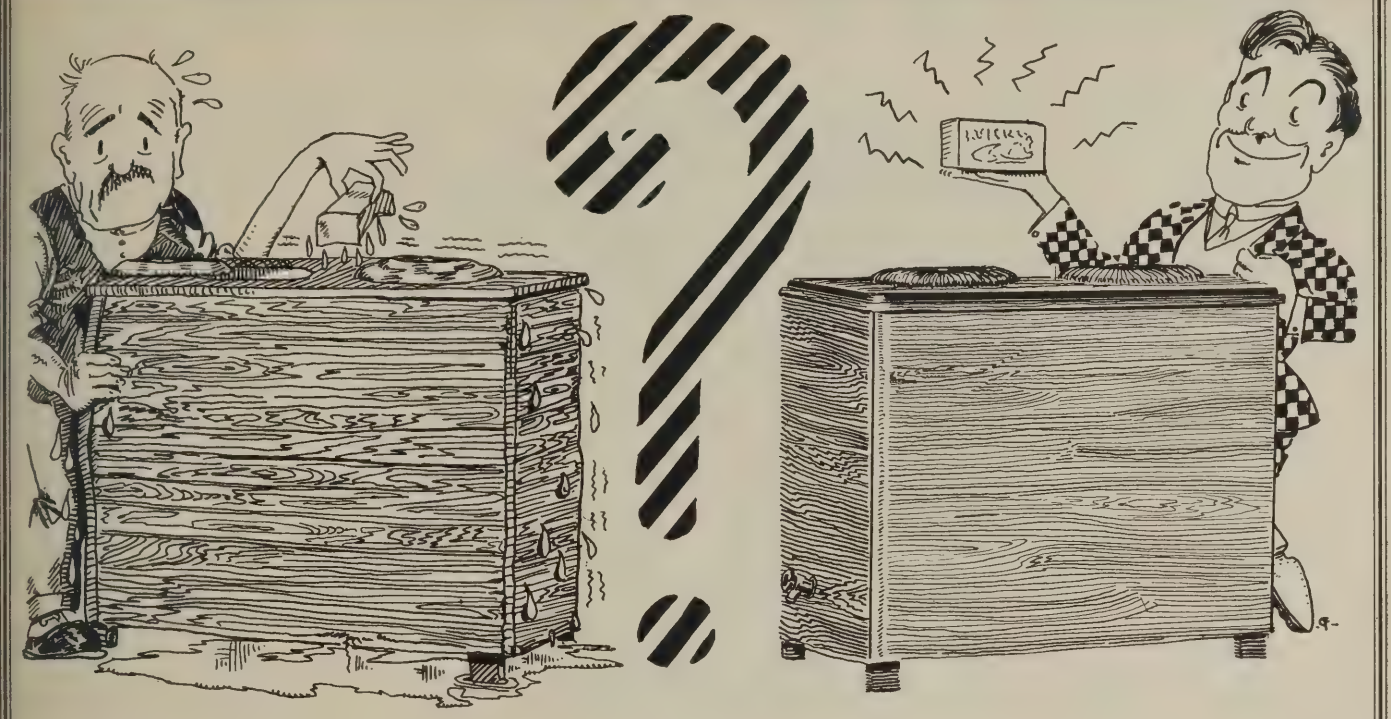
BUSINESS CONDITIONS IN THE SOUTH.

In the South as a whole I believe the ice cream industry will show a keen revival of a satisfactory 1922 season, and may in some sections advance to a very favorable one. The old story more often advanced, that the failure of the agricultural counties to produce a desired or favorable crop seems to be forever in reach of some few, who have found a fond likeness for the use of such phrase more or less as an alibi to twart off a more legitimate reason why their ice cream season did not measure up to expectations.

We see in our own town, as well as in all cities and towns surrounding us, a very lucrative sale at all times on cold drinks, Coca Cola, etc. Of course we all know that this national known drink claims the South as its birth, and it was in the South its popularity gained recognition in a fancied measure as well as in the northwest and east. The theory to be advanced is this. Would it not be reasonable to consider that if the ice cream manufacturers, individually and collectively, were to push the sale of their product with an optimistic view in mind their efforts in such direction would be financially rewarded which would be the incentive of a continued vigorous appraisement which would greatly lend to a more refreshened sale on their product and place it on a much higher level as a refreshment, to say nothing of a far greater point in their favor—ice cream as a food value.

Now since the tax has been taken off ice cream, would not such an action be directed in an opportune time. It is a false idea in the minds of many, a very chaotic one, that good things will come to those who wait, and while some things do, it is largely in a measure of an unceasing energy being rewarded justly for services rendered. If we were to turn on the gas without striking a match, thus inhaling the vapor, death would soon strike us; whereas, what is the use of gassing each other from time to time about what we intend doing, failing everlasting to strike a match to start something. This illustration covers the situation thoroughly. The right idea or solution has been formed but not as yet developed.



The year of 1922 will reward workers, and while the little bee makes the honey, lets all work like him and make the money. That little word "can't" has been long taken out of the "Webster" soup, and in the event you have cultivated a taste for it, just change your order next time and insist on Mock Turtle. It is not an easy way to kill a turtle since it will inspire you to see the non-dying energy as exhibited in its body which is forever on the move until the sun sinks down.

Lets all keep our heads and also acquire that turtle movement and master it throughout the day until sundown and then gratefully call it **the end of a perfect day.**

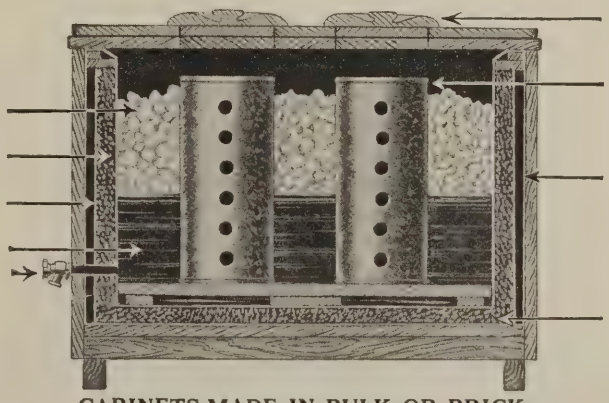
Manufacturers Everywhere Are Adopting "No-Swet" Cabinets

Do you think anyone of the multitude of "No-Swet" users would go back to the old-style cabinet days? Their answer is emphatically "No!"

The "No-Swet" cabinet has so many vitally important features in the conduct of a modern ice cream business that many of these manufacturers would as soon consider junking their latest machinery and return to hand-freezing methods.

Our Guarantee No. 2



We guarantee the "No-Swet" to keep Ice Cream and Ices in better condition, consuming less ice, than any other cabinet made.

Write today for our interesting circular. It fully explains the principles of this new innovation—yours for the asking.

In a public test at the Buffalo Exposition a "No-Swet" cabinet kept sherbet in perfect condition for 38 hours with one packing—a fact which vindicates our implicit belief that there never was a cabinet so near perfection as the

Food Products Institute of New Jersey is Organized

Ice Cream Men Taking Part

MANUFACTURERS of food products in the state of New Jersey met in Newark on March 24th for the purpose of forming a state organization. Samuel Mueller, president of C. F. Mueller Co., macaroni manufacturers of Jersey City, presided, and Dr. Frederic Dannerth, Director of the Food Products Laboratory of Newark, was appointed secretary of the meeting.

Mr. Mueller told the representatives present that the demand for a state organization was daily growing stronger as was evident from a large number of letters he had received from prominent firms in the state. More than 24 of the leading firms in the state had expressed their interest in the proposed organization. The chairman said in part: "Among the aims of such an association should be, (1) to better conditions and promote the welfare of the food producing industries of the state; (2) to make possible a practical and scientific study of food values; (3) to limit membership to such firms as can qualify by meeting the standards set by the society; (4) to promote research in the food industry by providing a laboratory for this purpose; (5) to promote the consumption of Jersey made products within the state.

After an extended discussion of the possibilities of the society it was voted to organize it under the title Food Products Institute of New Jersey. The chairman then announced the following as members of the Committee on Organization and Program:

Russel Kingman, pres. Purity Cross, Inc., Food Kitchens, Orange, N. J., chairman of committee.

Adolph E. Fink and L. F. Keller, vice-pres. A. Fink and Sons, Pork Packers, Newark.

Joseph Fischer, pres. Fischer Baking Co. Newark.

Jack Augenblick, vice-pres. Augenblick and Bro., Butter Producers, Newark.

George W. Beardsley, pres. Beardsley Sons, Shredded Codfish, Newark.

Gustav Wiedenmayer, pres. Puritan Ice Cream Co., Newark.

Gilbert Easton, pres. Easton Mayonnaise Co., Newark.

William Jorden, pres. Consumers Dairy Co., Union Hill, N. J.

William Meister, pres. Meister Lullman and Stretch, Dairies, Jersey City.

Thomas Eckerson, pres. Holland Butterine Co., Jersey City.

Samuel Mueller, pres. C. F. Mueller Co., makers of Macaroni and Egg Noodles, Jersey City.

Dr. Frederic Dannerth, director of the Food Products Laboratory of Newark, N. J.

A committee to draft a Constitution and plan for a big turnout of the food men of the state was formed with Mr. Russell B. Kingman, of the Purity Cross, Inc., Orange, N. J., as chairman. The invitation to join the Food Products Institute is being extended to Dairymen; bakers of bread and pie; pork packers, canners of meats and fish; canners of fruits and vegetables; milk producers and ice cream makers; coffee and cocoa roasters; makers of spices, salad dressings and condiments; producers of sugar, honey, glucose and candy; producers of oleo and nut margarins; makers of frozen eggs and egg powders. Firms desiring particulars and invitations for the forthcoming constitutional meeting should send the name of their managing executive to Dr. Frederic Dannerth, The Food Products Laboratory, 96 Academy St., Newark, N. J., the temporary secretary of the Institute.

NATIONAL COMMITTEE ON BOYS AND GIRLS CLUB WORK.

Several thousand dollars will be available for the Boys and Girls' Club Department at the National Dairy Show in 1922, in accordance with the program as outlined March 4th in the general offices of the National Dairy Association, which will be an increase of over 100 per cent more than was used last year in this department. The tentative plan calls for an expenditure of $3,500 by the National Dairy Show itself and the various breed associations will offer special prizes in addition.

The club department will be divided into three parts, namely, the judging contest, the demonstration work and the exhibit of the various herds and individuals. The judging contest will require an expense of $1,500. The demonstration work represents one or more teams from a number of states will require $1,000 and the exhibit will receive $1,000 in prizes plus the specials offered by the breed associations. The tentative plan announced by the Holstein-Friesian Association is to offer the following prizes for county herds composed of seven head of each county for Holsteins as follows:

First—$50. Second—$40. Third—$30. Fourth—$20. Fifth—$10.

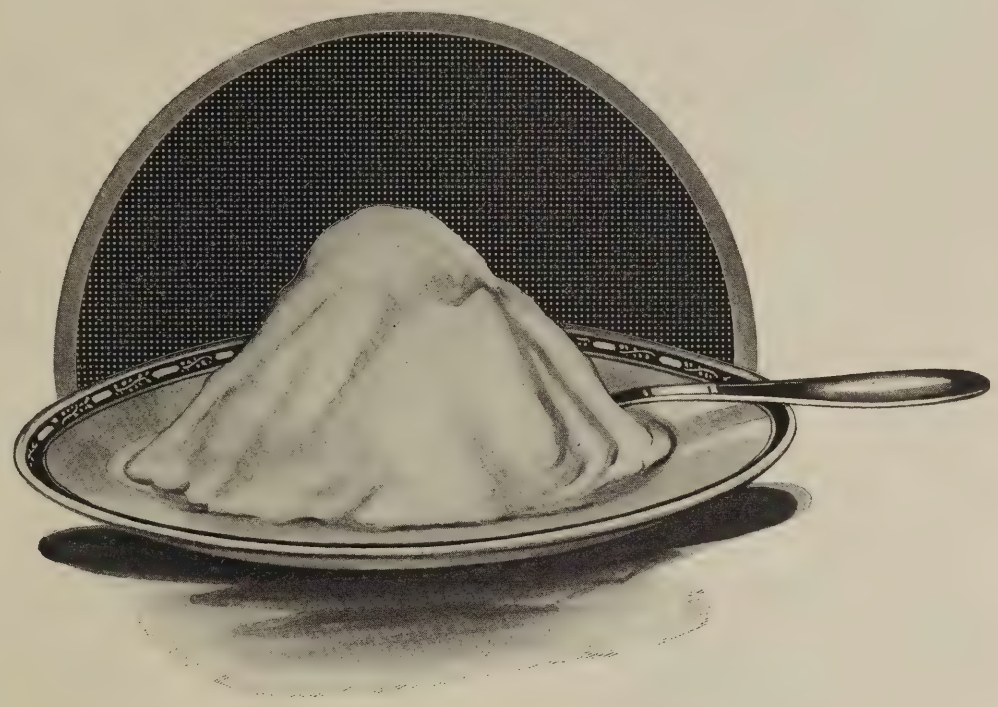
A $50 special will probably be offered by the Holstein-Friesian Association for the best state herd, provided it is composed exclusively of Holsteins.

The whole club program is enlarged and will be a great incentive for keen competition among boys and girls in dairy club work which will no doubt have a far reaching influence in increasing the growth of the dairy industry.

HANFORD PRODUCE CO. TO HAVE ICE CREAM DEPARTMENT.

The Hanford Produce Co. of O'Neill, Nebraska, is planning to construct a new creamery to replace the one which was destroyed by fire some years ago.

Plans for the size of the building are not fully matured as yet, but the ice house is already finished and filled with 1,000 tons of ice which is to be used in their ice cream department later.



Mr. A. S. Hanford is the president, J. H. Whittemore is secretary and treasurer and J. W. Schunck is general manager of the Hanford Produce Co. The company now deals in high grade creamery butter and eggs.

America's Favorite Dish

WHEN we stop to consider how well the ice cream industry, as a whole, has progressively maintained certain high standards of manufacture, it is not to be wondered at that Ice Cream "throughout the land" holds the esteem it does. Of course, in the early pioneer days there were trials and hardships, and the product then was not the delightful, velvety-smooth, delicious and wholesome dessert it is now. But always has Flavor been a very deciding factor — particularly with regard to increased consumption of ice cream. We believe you will agree that to those vanilla extract manufacturers, who painstakingly and continually labored in these pioneer days to perfect their product, belongs considerable credit. Surely, they profited by the "fruits of their labor," not alone in the increased business which steadily followed, but also in the splendid reputation established. Hudson's Vanilla Products for thirty-four years have been known as quality products. And, with a reputation of so long a standing, you can easily understand why we watch quality so closely, for in vanilla extracts it's quality, not price, which determines the value.

A Splendid Campaign

Mr. A. P. Holly, general secretary of the Indiana Manufacturers of Dairy Products, is putting on a unique advertising campaign, emphasizing the various important phases of plant management. He employs cartoons, such as the one reproduced below, for carrying his special message. You will note that in this one he emphasizes the cost of doing business—the item responsible for the failure of many plants. We are indebted

to Mr. Holly for the loan of the cut and we may be privileged to use others. Here is the circular:

Did you ever hear about the snowball that was started innocently by some children and which rolled down the hillside, gaining such proportions and momentum that it wiped out a whole village?

The accumulated mass of High Costs is the Snowball that may ruin some Ice Cream or Milk Plant or Creamery.

Is that Creamery your Creamery?
Is that Ice Cream Plant your plant?
Is that Milk Plant your Plant?

Yours truly,

A. P. HOLLY,
General Secretary.

THE ESTANCIA DAIRY COMPANY ENLARGES PLANT.

The Estancia Dairy Company, of Estancia, New Mexico, is now building a new creamery, installing two Cherry pasteurizers, a dreadnaught freezer and a new 800 pound churn and various other equipment to pasteurize milk and distribute dairy products throughout the state. The company is at present in the butter business, but will add the other departments, ice cream, milk and sweet cream, with the complete installation of the new equipment in the completed building.

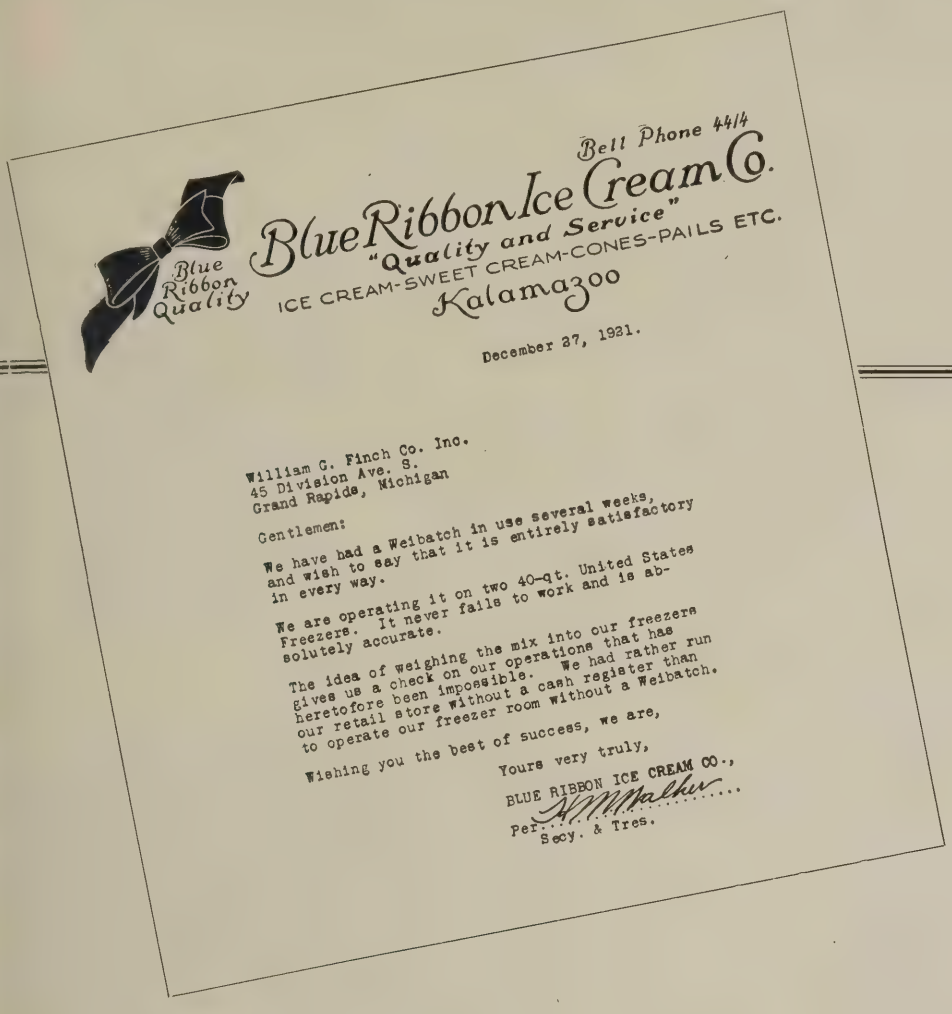
The company has an authorized capital of $50,000, but the books have been closed at the selling of $10,000 worth, as it is all that is needed at present to install the machinery and further the business.

The company is in an ideal location, both as to market and milk obtainable. They will install their own ice machinery; and will have a capacity of about 550 gallons of milk per hour.

Mr. D. D. Sharp, the secretary and treasurer, was the promoter of the new enterprise. Mr. Sharp is now also the general manager but Mr. W. H. Greenfield, of the Beatrice Creamery Company, will soon occupy this position.

The appointment of Mr. Greenfield is quite unique. When the new company was organized, Mr. Sharp wired to Denver to both the Davis-Watkins and the Beatrice Creamery Company for a man to come down to sell the equipment. Mr. Greenfield was the first one to arrive and waited the coming of Mr. Kessler. While waiting Mr. Greenfield went into the proposition with Mr. Sharp as to difficulties which might confront the new creamery. After concluding the investigation, Mr. Greenfield remarked that it looked good enough to him to "take a shot at it." Mr. Sharp, hardly believing the good fortune thrown to the new concern, asked his proposition and immediately Mr. Greenfield was advised that the new corporation would grant all his terms and allow him to obtain $2,000 worth of stock in the new corporation. The result was that Mr. Greenfield resigned his position with the Beatrice Creamery Supply Company and will take charge of the Estancia Dairy Company as soon as the building is completed and the equipment is installed.

The officers of the Company are: Neal Jenson, president; Seth Williams, vice-president; D. D. Sharp, secretary-treasurer. Directors: Neal Jenson, Seth Williams, W. H. Greenfield, D. D. Sharp, and D. W. Jennings.



NEW ICE CREAM COMPANY IN LITTLE ROCK.

The Pulaski Ice Company of Little Rock, Arkansas, has incorporated with a capital stock of $25,000.

The officers of the new company are: W. F. Moody, president; Ira H. Stanton, vice president; and Fred Raetz, secretary and treasurer.

The new company plans to erect a plant to supply ice and ice cream to the Pulaski Heights section in the city of Little Rock. The capacity will be 15 tons of ice and 500 gallons of ice cream per day.

The building will be a frame bungalow type of structure, one story, 40 x 80 ft., and the estimated cost of it is about $7,000. It is hoped that the plant will be in operation by June 1st.

Gentlemen:

We have had a Weibatch in use several weeks, and wish to say that it is entirely satisfactory in every way.

We are operating it on two 40-qt. United States Freezers. It never fails to work and is absolutely accurate.

The idea of weighing the mix into our freezers gives us a check on our operations that has heretofore been impossible. We had rather run our retail store without a cash register than to operate our freezer room without a Weibatch.

Wishing you the best of success, we are,

Yours very truly,

BLUE RIBBON ICE CREAM CO.,

Per A. M. Walker

Secy. & Treas.

The WEIBATCH

It Weighs

AS AN ice cream batch control, one Weibatch, placed between two freezers, will automatically weigh, record, and deliver to the freezers a definite number of pounds of ice cream mix. It will save time, prevent waste, and give the factory manager a check on the mixing room, freezing room, and hardening room that has heretofore been impossible.

Every ice cream manufacturer knows that the specific gravity of ice cream mix is constantly changing, and that any measuring device, no matter how accurate it may be in volume, is very misleading when checking back against the mixing room or the freezer room.

Eliminate Guesswork—Weigh the Mix

NOTES ON THE NORTH DAKOTA CONVENTION.

The North Dakota Ice Cream Manufacturers Convention, held in affiliation with the North Dakota Dairymens' Association March 7, 8, 9, was heralded as a fine success. The ice cream men gathered in a large room of the Leland Hotel, where their meeting was called to order. Many interesting talks and discussions were given, some of which are noted in the following:

President Knerr told of the happenings at the National Ice Cream Makers' last convention. He said that the keynote of the national convention was Quality. To quote his own words, "Not many other things stand higher than the matter of quality."

Henry Geist, of Grand Forks, talked on "The Association's Code of Ethics and Its Purpose."

R. O. Baird, Chief Deputy Food Commissioner, Fargo, talked on "The Use of Gelatine." He also displayed five grades of gelatine, and showed how to test them for their jellying qualities. The highest grade gelatine thickened rapidly, and was clear and odorless. The lower grade did not thicken for a few hours, was cloudy in appearance, and had an unattractive, somewhat gluey odor.

R. F. Bridgeman, of Grand Forks, spoke on "How the Association can Function so as to be of Service to It's Members."

Mr. Bridgeman said, "Our Association is not large enough to affiliate with the other dairymen, and employ a permanent secretary. We must get along with a volunteer secretary, and we can do it very successfully, if everyone helps as they do over in North Carolina."

"The Association can have a lot to do in accomplishing lower express rates. It is my opinion that an individual complaint to the railroad commission does not carry as well as an organized complaint. A traffic committee should be appointed, to make comparisons and put them up to the commission. I think something can be done along this line."

"We can take a lot of interest in the legislation. We should oppose detrimental legislation and favor good legislation."

Another thing which Mr. Bridgeman brought out was the suggestion that a law should be made enforcing dealers in ice cream to wash the ice cream cans and return them immediately after the contents have been removed, this law to be passed from a sanitative viewpoint, and enforced by the state sanitative commission.

A discussion came up in the afternoon in regard to using cheese color in ice cream. North Dakota has a law forbidding the use of such coloring, because of the false impression conveyed as to the richness of the ice cream. The sentiment of the discussion was, however, that ice cream with a little of the coloring in it appeals to the eye, and will tend to increase ice cream sales.

A discussion on price lowering followed. J. J. Farrell, of St. Paul, suggested being careful and going slowly in lowering prices. "We must think of the rest of the industry, and keep the farmer a-milking and the dairy trade men working," he said. "The reduction in price of wholesale cream is not causing the retailers to lower their prices."

The North Dakota Ice Cream Manufacturers Association elected O. A. Ammundson, of Bridgeman-Russell Co., Jamestown, N. D., as president, and G. B. Caraway, of Midland Produce Co., Fargo, N. D., as secretary-treasurer.

Extract from song sheet at North Dakota State Dairymen's Convention:

NORTH DAKOTA.

Tune: "Beautiful K-Katy."

North Dakota, North Dakota,
You're the only, only state that I adore;
When the cows fill all the milk pails,
You'll be worth a m-m-m-m million dollars more.
North Dakota, North Dakota,
You're the only, only state that I adore;
When the cows fill all the milk pails,
You'll be worth a m-m-m-m million dollars more.

SOUTH DAKOTA ASSOCIATION HOLDS PROFITABLE MEETING.

Another feather in our already much beplumed cap! At a business meeting of the ice cream manufacturers of South Dakota, held Thursday morning, March 31st, at the Marvin Hugitt Hotel, Huron, S. D., The Ice Cream Review was made official organ of that Association. Accept our sincerest thanks, gentlemen, and count on us for all the co-operation in our power to make your Association a success.

At this meeting the following officers were elected: President, I. J. Bibby, Brookings; vice-president, G. W. Arlt, Rapid City; secretary-treasurer, T. H. Wright, Jr., Brookings.

The following men were elected to the Board of Directors: Mr. Langenfeldt, Watertown; Mr. Skoug, Sioux Falls; Mr. Derby, Chamberlain; Mr. Binder, Yankton, and Mr. Mathews, of Aberdeen.

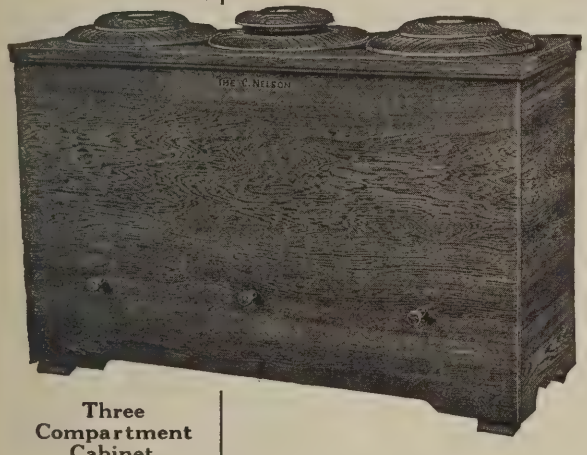
In order to eliminate the losses due to bad accounts incurred when a retailer runs up a large bill with one manufacturer, and then changes to another to do the same thing, it was proposed that each member notify the Secretary at once when it became necessary for him to put a dealer on the C. O. D. list. The names of these firms would then be forwarded to the other members of the Association, so that they might protect themselves by shipping C. O. D.

The practice of equalizing express rates came under discussion, and was condemned by those present. It was brought out that it was unfair to the retailer close to the factory to cause him to pay express charges for the retailer located at a distance.

Another suggestion put forth was that all members send in a list of supply houses with whom they deal. These houses will then be given an opportunity to become associate members. Later it is the plan of the Secretary to get out a list of both active and associate members.

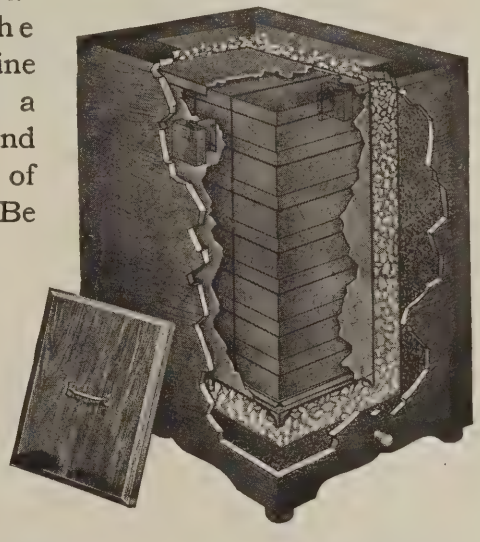
The Board of Directors arrived at a decision to have last year's membership carry over for this year, without additional fees.

SAIS ICE CREAM CO. MAKES IMPROVEMENTS.



The Sais Sanitary Ice Cream Company, of Bradentown, Florida, have made extensive improvements to their plant. About eighteen months ago they installed a 4-ton refrigerating plant and a second hand Cherry brine freezer. About a month ago a new 60-quart Cherry brine freezer was installed, and they will soon have in operation a 40-quart batch mixer, pasteurizer and emulsifier in one unit, with a small steam boiler for operating it. Mr. R. W. Freyschmidt, formerly of the Freyschmidt Ice Cream Company, and the Freyschmidt Drug Store of Charleston, S. C., is now associated with the company.

Nelson (Patented) Ice Cream Cabinets



"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

Three Compartment Cabinet

C. Nelson Brick Cabinet
Patented May 8, 1906

42 Qt. Brick Cabinet with Ice Rail

Patented Nov. 11, 1919—1321120

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Plan on your season's requirements now, and have your supply on hand when needed.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Bartlesville, Ala.—Both the Bartlesville Ice Cream Company and the Waukesha Ice Cream Company of this city are making preparations to add creameries to their plants.

Decatur, Ala.—Announcement was made recently by the Decatur Ice Cream & Creamery Co. that branch plants will be opened immediately in Scottsboro, Jackson County, and Athens, Limestone County.

Jonesboro, Ark.—The Scott Ice Cream Company and the Coca-Cola Company suffered damages by fire recently estimated at $10,000. A. J. Scott is the owner of the Coca-Cola plant and manager of the ice cream factory.

Little Rock, Ark.—A company to be known as the Pulaski Ice Company has been organized for the manufacturing of ice and ice cream. The factory will be an attractive bungalow structure. The plant will cost $25,000.

Pine Bluff, Ark.—The plant of the Liberty Ice Cream Co. has been purchased by the recently organized Blue Ribbon Manufacturing Company, of which J. A. Bolin, Geo. H. Holmes, Hall Deer and Chas. J. Kures are incorporators.

Glendale, Cal.—A $20,000 ice cream and candy factory is being established here by J. P. Metheus of Vancouver, B.C.

Los Angeles, Cal.—The L. J. Christopher Company of this city recently opened a branch plant at Long Beach, Cal. They are also building a $30,000 addition to their Los Angeles plant, which will be used as a refrigeration plant.

Santa Ana, Cal.—A new plant, to cost $28,000, will be erected by the Excelsior Creamery Company. They are planning to install $50,000 worth of machinery. It is the intention of the company to use this plant as a creamery, and later to install an ice cream plant.

Visalia, Cal.—The building of an additional plant at Fresno is being considered by the Valley Ice Cream Company of this city, manufacturers of Acme brand ice cream.

Denver, Colo.—A large addition has recently been completed by the Windsor Farm Dairy, which is to be used for the manufacture of ice cream.

Dalton, Ga.—Mr. Emil Hoerth of Creston, Ill., will be placed in charge of the ice cream manufacturing plant of the Dalton Creamery, which was placed in operation recently.

Savannah, Ga.—Fire, getting its origin from a gas heating apparatus, spread quickly over the second floor of the Forest City Ice Cream Company, in an early morning blaze recently. Ladders were quickly raised to the second floor of the building, where the room in which the flames got their origin was located. Before the fire could be controlled it had eaten its way to the roof. The loss will total several hundred dollars, officials of the Forest City Ice Cream Company stated.

Lewiston, Ida.—The Lewiston Ice Cream Company has recently been incorporated with capital stock of $5,000.

Chicago, Ill.—The Hydrox Company of Chicago announces the discontinuance of its commercial grade of ice cream. It is now manufacturing only one grade, the Hydrox-Guernsey ice cream.

Chicago, Ill.—Fire of unknown origin destroyed the interior of a four-story building occupied by the John T. Cunningham Ice Cream Company recently. The loss is estimated at $12,000. The refrigeration system, it is said, was worth approximately $6,000.

Chicago, Ill.—The Goodman American Ice Cream Company announces that it will cover the most of the block, Forty-fifth Street to Forty-fifth Place, and Federal Street to the railroad, with an ice cream plant to be one of Chicago's largest.

The architects will start construction soon on the first unit, to complete it June 1. The initial unit, two stories on 60x170 feet, will cost $75,000, and the entire plant about $400,000.

East St. Louis, Ill.—The Highland Ice Cream & Cold Storage Company will manufacture ice and ice cream. A new plant is to be erected.

Highland, Ill.—Gus. Reichert has recently added to the efficiency of his ice cream manufactory by having built in one of the rooms a large air tight box, 6x12 feet in size, designed and prepared especially for the curing of ice cream.

Oak Park, Ill.—The Traill and Cooling Ice Cream Company are making several improvements in their plant, which include the addition of three 80-quart ice cream freezers, and another 25-ton ice machine. They are also building two new hardening rooms, which will give them a capacity of 1,000 gallons and are adding five new 5-ton gas cars with ice cream bodies to their delivery service.

Park Ridge, Ill.—The Ridge Ice Company, 21 Cumberland Ave., manufacturing beverages, ice, ice cream, etc., was incorporated with capital stock of $50,000. Incorporators are Wm. C. Robinson, Frank Tieman and R. C. McGregor.

Rochelle, Ill.—Mr. Fred Harrison of De Kalb, Ill., recently purchased the Allen Ice Cream Company of this city. This company will retain their plant in Rockford, and are planning to open branches in other cities nearby this season.

Shelbyville, Ill.—A new plant is being erected here by the Fertig Dairy Company of Franklin, Ind.

Anderson, Ind.—The Anderson Ice Cream Company is a new business venture. A building permit was issued authorizing the company to remodel the business block at Meridian and Sixteenth Streets at a cost of $3,000. A plant for making ice cream will be located in that building.

Crawfordsville, Ind.—A new plant will be opened here by the Wray and Ward Ice Cream Company of Lebanon, Indiana, it was announced recently by Messrs. Albert C. Wray and Forrest A. Ward, proprietors.

Elwood, Ind.—The Warren Ice Cream and Ice Company a new concern to operate at Warren, elected the following officers recently: E. O. Ellerman, of Elwood, president; Gorman Trixler, Huntington, vice-president; Orva Sales, Huntington, secretary-treasurer. Mr. Ellerman is president of the Elwood creamery, and the cream for the new plant at Warren and the one at Huntington will be mixed here and shipped ready for freezing.

Fort Wayne, Ind.—An ice cream manufacturing department will be installed in the factory of the Amboy Creamery Company. Ice cream manufacturing equipment has been purchased.

Kokomo, Ind.—The Kokomo Sanitary Milk Company is considering the installation of an ice machine and a freezer.

Lafayette, Ind.—The Chamberlin Ice Cream Company is erecting a new plant.

Princeton, Ind.—Mr. Bell of Richmond, Ind., has purchased the Hallett and Woods ice cream factory.

Rochester, Ind.—An addition is being added to the present plant of O. S. Goss.

Terre Haute, Ind.—The ice cream business of Harkness and Makely has been purchased by Isaac H. and Irwin P. King. The new name of the firm will be King Bros., and it will be in charge of Mr. Isaac King.

Bedford, Iowa.—Walter Evans, local produce buyer, is going to re-open his ice cream plant here ths spring.

Corydon, Ia.—The firm of Nickles & Son have installed an up-to-date ice cream plant, which is now in operation. All the equipment is new and up-to-date, and the plant will have a capacity of 250 gallons a day.

Glendale, Ia.—J. P. Matheus of Vancouver, B. C., is having installed equipment and store fixtures of a candy and ice cream establishment, that will represent an investment of $20,000. He will manufacture his candy and ice cream and have a salesroom in the same building.

Humboldt, Ia.—The Humboldt Creamery Company is preparing to make some rather extensive improvements in their ice cream department which will put them second to none in this part of the state so far as up-to-date equipment is concerned.

Iowa Falls, Ia.—F. B. Toner of Iowa Falls has been engaged by the Howard V. Kratz Dairy and Ice Cream Manufacturing Company at Hampton as buttermaker and ice cream manufacturer. Mr. Toner has been in the dairy products and ice cream trade for about fifteen years, and for some time past he has been manager of the Iowa Falls Ice Cream Co.

New Hampton, Ia.—The Fossleman Ice Cream Factory of Waverly has rented a building on East Main Street, and will put in a first class ice cream storage station.

T. B. Scully is to have charge of the establishment. He says that a refrigerator plant will be installed and the ice cream will be brought here in truck loads to be distributed from here as demanded.

The Fossleman Factory made 90,000 gallons of ice cream last year.

Shenandoah, Ia.—George Louie has remodeled the back part of his store and now has the equipment for a complete creamery and ice cream plant on the floor and most of it ready for use. In addition to the machinery he had a big freezing or cold storage room erected and when all the work of installation is completed, will supply the trade with dairy products as well as ice cream.

Storm Lake, Ia.—The Storm Lake Produce Company is installing new machinery this month for the manufacture of ice cream, representing an investment of $3,000. A viscolizer, a mixing vat and tubular cooler make up the new outfit.

(Continued on page 126)

Fundamentally Right

THE success attending the adoption of the "Sealright Way" —bulk ice cream in package form—is not of a temporary nature, dependent on "the novelty of its newness" or speculative possibilities. Its success is of a permanent nature. The idea back of it originates from an ever-pressing need of long standing—something lacking heretofore, but essentially necessary to complete a satisfactory ice cream merchandising plan.

And for the simple reason that the "Sealright Way" meets this need practically, efficiently and economically for the manufacturer, the retailer and the consumer, because it is so fundamentally correct in principle, it is not to be wondered at that its reception has been so enthusiastically acclaimed and so spontaneously responded to everywhere. The "Sealright Way" bears so important a relation to greater sales possibilities for you, that it is deserving of your most earnest and careful investigation and consideration. You ought to have all the details now—before the rush season is on.

These Features—Found Exclusively on the Cherry 80-Quart Freezer will interest you

ALL the engineering experience and mechanical skill in the big Cherry organization was brought into play to design this latest addition to our well-known line of brine freezers.

Some idea of the precision with which this machine is built can be gained from the fact that a variation in dimensions of less than two one-thousandths of an inch is tolerated.

Many of the metals used in the construction of this new freezer are made to our own special formulas. Take for example the dasher: all parts, with the exception of the shaft, are cast bronze or phosphor bronze. The tapered end of the shaft, which fits into the head of the machine, is made from Delhi steel. The outlet gate is equipped with Belleville steel springs (the same as were used in the recoil mechanism of the famous French 75 m. m. guns). The three mitre gears are made from specially selected alloy steel, drop forged and are attached to their shafts with **both** steel keys and set screws. They are designed to wear forever and misalignment is impossible.

There are **five** ball bearings used in the new Cherry 80-quart Brine Freezer. They are the S K F self-aligning ball type. Roller bearings have merit, but ball bearings are admittedly superior.

Special machinery is required for the manufacture of this new Cherry Freezer. It is actually "built like a watch"—both as a piece of mechanism and as a manufacturing unit. It has absolutely no superior in the ice cream field. As a matter of fact it does not **yet** have even an imitator.

In summing up the features of this new freezer, it is well to add that, like the Cherry Dreadnaught 60, this machine is fitted with a swinging head, which affords quick and easy access to the inner freezing cylinder for cleaning; all controls are at the discharge or unloading end and within easy reaching distance of the operator; the inner freezing cylinder is quickly and easily removed by simply loosening six square head bolts, which affords ready access to the brine chamber, if that is ever necessary.

The Bulletin illustrating and describing the new Cherry 80-Quart Freezer is now available. Write or wire us for your copy TODAY!

JOHN FERGUSON PASSES AWAY.

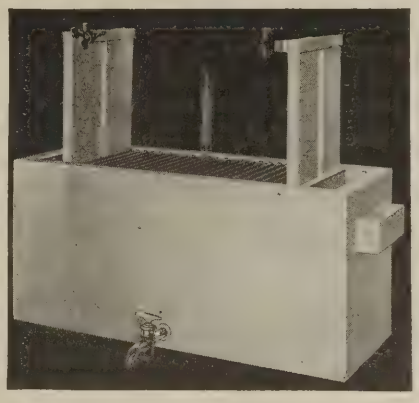
Friends of John Ferguson of Detroit—and they are many—will be grieved to learn of his sudden death March 17th, at Kingston, Ontario, following a heart attack.

JOHN FERGUSON.

Mr. Ferguson was the dean of Frederick C. Mathews Company's selling organization. He had represented this Detroit house in every part of the United States and Canada. His dynamic energy and enthusiasm, which would even have been noteworthy in a young man, were phenomenal in a man past sixty. There is no doubt that he gave to many dairymen and ice cream manufacturers a new vision of their business possibilities and pointed their way to greater success. His integrity was never questioned.

He had always said that he expected "to die in the harness," and the end came while he was on a very successful trip. Burial was at Port Huron, Mich., on the 21st, under auspices of the Elks, and was attended by the officers of the Mathews Company and many other friends. He left no family.

PURITY CREAMERY COMPANY RE-ORGANIZES.



The Purity Creamery Company, of Moscow, Idaho, has been lately re-organized and incorporated with twenty-five thousand dollars paid up capital.

R. G. Wood, founder of the organization, has associated N. Williamson, formerly Moscow's largest merchant, and at this time the most extensive dealer in cattle, with the Purity Creamery and they mean to put this live wire concern on the map.

The company has complete equipment for making ice cream, butter, buttermilk, and chocolate covered ice cream bars. They deal in milk and cream for the surrounding territory. They are now installing a four ton daily ice making plant, with sufficient room for storage. This added equipment, with their nine ton Armstrong machine and Progress horizontal freezer and Davis Watkins equipment, gives them a very modern and efficient plant.

In the near future it is their plan to install a cold storage room 40x80 ft. which will accommodate the Moscow producers of eggs and dealers in storage products and at the same time give the Purity Creamery ample storage space for any needs of the territory.

The company occupies a building constructed by the Moscow Packing and Cold Storage Company some years ago at a cost of $12,000, and realty valued at $3,000 accompanies this property, which is now owned by the Purity Creamery Company without incumbrance. Mr. R. J. Safford is secretary and treasurer of the company.

Arkansas Ice Cream Manufacturers' Association

Proceedings of the Fourth Annual Convention

THE association convened at the Marion Hotel at 10 A. M. on Jan. 10, 1922, and in the absence of J. R. Jones, president, and J. R. Bourland, vice president, the meeting was called to order by Mr. Will Terry, who presided as chairman during the convention.

Mr. J. Gilbert Leigh, of the Little Rock Chamber of Commerce, delivered the address of welcome, assuring the ice cream manufacturers of the hearty cooperation of the Chamber of Commerce in the matter of freight and express rates and any other matters in which the Chamber of Commerce could be of service to the manufacturers. This was responded to by Mr. S. S. Summerfield, who told of the increased consumption of ice cream in this state, and of the rapid growth of the industry.

ADVERTISING ICE CREAM.

By Will Terry, Terry Dairy Co., Little Rock, Ark.

Before giving a thought to advertising one must be sure that the quality of his goods will back his advertising, otherwise it is worse than useless to advertise, for a false advertisement will do much more damage to the reputation of a business concern than if no advertising had been attempted.

First be sure that the quality of the goods you have to offer is such that you believe thoroughly and implicitly in them, in other words sell your goods to yourself before you attempt to sell them to anyone else. This is absolutely essential to a successful selling campaign. Having thoroughly convinced yourself of the superior quality of your goods, the next step is to consider the best method of convincing others of the same thing.

To bring the attention of the public to the fact that you are offering them something that is absolutely good and something that will interest them, it is necessary to consider the different methods of reaching different classes of people. There are various and sundry advertising mediums, some of them possessing real virtue, while others are of questionable value.

The food value and other good features of ice cream should be thoroughly instilled in the minds of the people, trying always to associate your name or your brand with the product, so that when they think of ice cream they think of your ice cream. Persistent advertising is the only thing that will do this, and it takes time and perseverance.

Having accomplished this purpose, the best method of reaching different classes of people is to be considered.

Newspaper advertising is probably the most valuable medium that can be used, for by this means a larger percentage of people can be reached than by any other one medium. Newspaper advertising gives you an opportunity to make special announcements that can reach the public at once.

Street car advertising is read only by those who ride street cars regularly, so you cannot expect to reach any large percentage of people by this method, although it has a certain value.

Billboards properly placed are read by people who ride street cars, by people who walk, and by autoists and I consider this a very good advertising medium providing attractive posters are used, and care and judgment used in securing the proper location.

Attractive window cards, fountain cards and menu cards displayed in your customers' places of business also have their value, but advertising matter of this kind must be of the very highest order—must be artistic, attractive and suggestive—and must be something more than just printed cards and cuts, it must be something that will stand out and attract attention where ordinary advertisements of this kind would be passed unnoticed, it must be such that it will hold the interest of the observer until he had read it entirely through and has created a desire on his part to try the article advertised, and impressed on his mind that it is your product that is being offered. He will then try it, and if it is something absolutely good, he will always associate that good quality with your name or brand in his mind, and will ask for your product.

If you can enlist on your side any considerable number of children you will have a lot of boosters, as a child's mind is quick to receive impressions and associate the makers with his product. Various methods have been devised for interesting children in a particular brand or product, and they have their influence in the homes which is far-reaching in its result. School children can be invited to inspect your plant, in charge of their teachers. Show them through your plant, explaining each operation to them, telling them of the food value of ice cream and demonstrating the cleanliness and sanitary methods used in making your product, and when they are ready to leave present each one with an ice cream cone, and a little circular de-

scribing your product, various ways of serving it, and your special brands, and request the children to give their circulars to their mothers, and by this method you will send into each home just the information that you desire them to have, and the child will be a good salesman for you.

It is necessary for you to keep your name and your brand constantly before the public by means of the different advertising mediums, and to do this requires persistency.

A few years ago the advertising pages were merely a directory of things for sale, and the places where they could be purchased, but the science of advertising has kept pace with the general advancement, and now a successful advertisement must have a particular message to impart, and must be so vivid that it will at once impress the reader with the idea it is intended to convey, and leave a lasting impression on his mind.

Advertising was formerly considered an expense, but it has been developed and improved until it has really become an investment, and when maintained and cared for as other assets are, it will probably show greater earnings than any other department of your business.

Statistics show that 84 per cent of the business failures of the past year occurred among firms which did not advertise. This fact alone is more convincing than many pages of argument in favor of advertising. You have all noticed that the large mercantile concerns of the United States, those that are nationally known, and those that do a very large percentage of the business of the country, are all regular and heavy advertisers.

In conclusion I will say that I do not believe any business can succeed without advertising of some kind, and that the degree of success attained will be measured by the care and judgment used in your advertising matter, and the medium used to convey this advertising to the public.

No definite and particular plan can be laid down for an advertising campaign that will fit all conditions, but it is necessary for the advertiser to carefully consider the circumstances and conditions surrounding his particular case, and plan his campaign accordingly, then carry it through to a successful termination, bearing in mind always that his goods must fully meet the expectations created by his advertisements.

* * *

The meeting then adjourned to accept an invitation of the Kiawanis Club to luncheon, which was thoroughly enjoyed by every member present.

At 2:00 o'clock the meeting was called to order and listened to a splendid address by Virgil C. Pettie on the "Resources of Arkansas."

COST OF MAKING ICE CREAM.

By Mr. Charles Hooberry, Pine Bluff, Ark.

It is daily becoming a more and more recognized fact that it pays to work together, and at this convention you will meet the largest manufacturers of the state in the ice cream industry, intelligent, friendly men, who are working hard to increase the total production of the industry and keep it established on a sound, straight-forward basis.

Bear in mind that it is the duty of each and every ice cream manufacturer to practice as well as preach the gospel of co-operation, and to work with the other members of his industry to raise the standard of producing and selling.

I have made every effort to place upon the market a product that would stimulate the enthusiastic use of ice cream. The growth of the ice cream industry depends upon the attitude of the public, if it regards ice cream as a confection, as a luxury, the development of the industry is impeded. If it regards ice cream as a food, the industry has a great future.

In attempting to increase our sales we emphasize the food value of ice cream, in our advertisements, and in so doing it we are able to increase our volume, we not only advance the interest of the industry, but we substantially reduce manufacturing cost.

It is through efficiency that we are able to determine manufacturing cost. Efficiency, meaning system, is necessary in every department, system in management, system in the mixing room, system in bookkeeping. It is in reality an indispensable adjunct to good management and the manager armed with the facts and information it affords, properly arranged and instantly available, enjoys a tremendous advantage over his competitors not so fortified, and is able to meet conditions as they come. This is more especially true in uncertain times like the present, when in order to successfully meet varying conditions the ice cream manager must have the results of his previous month's operations available at the earliest possible moment, in other words, he needs these facts while they are still news, not history.

I have with me a mixing room report upon which is listed the items composing a mix giving me the gallons, weight, fat, solids not fat, and total solids and cost of mix. Upon the reverse side of this report I have a report from the freezing room, giving me such data as follows: Total pounds mix, total gallons mix, total gallons finished over-run ratio, average over-run test, number of over-run tests made, temperature of mix, temperature of brine, brine pressure, age when frozen,

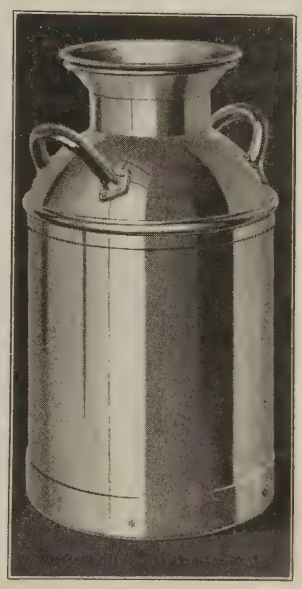
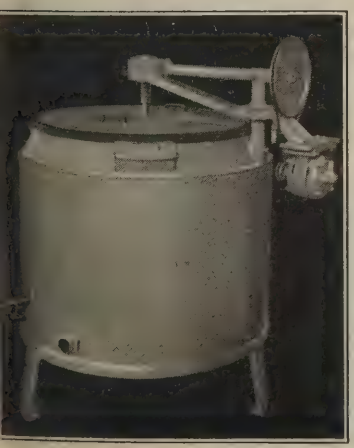
Disbrow Churn and Worker.

Progress Cream Ripener.



Dairymen's Cleveland Can.



BUTTERMAKERS, the world over, know what you are talking about when you mention the word "Disbrow." It pictures a definite and pleasing thing to their minds. Definite, because the imagination so vividly and accurately presents them with a "Disbrow" which is true to the minutest detail. And pleasing, because of the many pleasant memories connected with it. Making creamery butter in a Disbrow Combined Churn and Worker is a pleasure for the operator, and a money maker for the proprietor.

"Progress" Cream Ripeners are likewise popular with the creamerymen. The excellence of this equipment is properly indicated by the clean sanitary appearance. The solid efficient construction is such as to make a "Progress" booster out of every owner. Many creamery supply houses handle "Disbrow" and "Progress" equipment, knowing full well the advisability of selling their good customers machinery which has proved its real merit among thousands of buttermakers.

If in doubt, ask somebody—anybody. The man may be prejudiced for one reason or another. If he is he'll say, "Oh, yes, those are good machines." If he isn't prejudiced, no doubt you'll have a hard time stopping his rapid flow of conversation.

FREEZE YOUR ICE CREAM IN AN ADVERTISED FREEZER.

time started, time finished, and then the number of gallons finished, itemized in pints, quarts, half-gallons, gallons, brick, etc. From such a report you may be assured that I am in close touch with a department, that the future of my business depends, and it is in this department that special attention must be given, but to stop here in arriving at manufacturing cost would be to lose sight of the real cost in manufacturing ice cream, this cost I shall discuss later.

In addition to my freezing room report, I have a report of my hardening room, an inventory of which I require weekly, and by referring to my report of the first of the month and securing the inventory at that time and referring to my freezing room report and securing the gallons manufactured for the week and adding the same to this inventory, and securing from my accounting department the sales, and deducting these, I am now in position to compare the balance on hand with the inventory on the first of the following week, and in this manner I am in position to ascertain if there are any leaks. I require a record made of every pint of ice cream or ices that go out of my box, and permit me to assure you that it is the possible leaks here that determine largely the manufacturing cost. But taking it for granted that the mixing room and the hardening room reports are coming up to expectation, we will now consider some of the other elements entering into manufacturing cost.

Which are factory supplies, factory labor, power and refrigeration, water, factory maintenance, rent, depreciation, ice and salt.

The general charges that compose most of these subdivisions will be at once apparent. Power and refrigeration expense, however, is a very important item of manufacturing cost that is not always given the attention it deserves. All charges for direct labor, fuel, electric current, should first be posted to a power account so that the actual cost of operatiog the power plant as a whole can be ascertained, therefore monthly transfers are made from the power account to the manufacturing cost account of every department that has used power during the month.

Depreciation is another vital factor that in many cases is neglected because its importance in relation to cost is not always clearly understood. This is more unfortunate owing that it is in many instances one of the largest items of cost, and if disregarded, may easily mislead you in thinking you are making a substantial profit while possibly you are sustaining a loss. The method of handling depreciation used by many concerns not up to date in accounting practices, is to wait until the end of the year and then charge it off in a lump sum. It will be at once apparent that if this should be charged off at the end of the year, it is something that has been entering into the cost of your product every day and every month during the year, so far as your month to month cost is concerned. Therefore you have been in the dark, so to speak, and can only know your real results at the end of the year, when it is usually too late to act.

We have now given consideration to manufacturing cost and have come to the final elements of selling and administrative cost. In some lines of industry no attempt is made to treat such general expense as factors entering into the calculation for determining the cost of the product. In the ice cream industry, however, it is practicable and advisable to apply charges of this kind, not only to cost by departments but also to cost per unit. Expenditures classified as selling cost or administrative cost are of two kinds, direct and indirect. Selling cost comprises all such items charged to these general expense accounts as may be easily classified and readily distributed directly to departments, for example, freight and drayage, delivery expense, salesman salaries and expenses, losses on bad accounts. Indirect selling or administrative cost consist of all remaining general expense items not classified as direct, the main sub-divisions under this heading are: Officers' salary and expenses, general office salaries, general advertising, general office supplies and expense, interest paid, legal expense, etc.

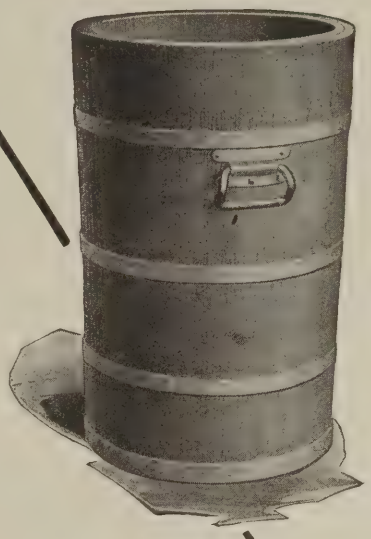
All the elements of cost have now been recorded and the sum of the sub-totals present the total cost per unit, as well as the aggregate amount of money involved. The manager now knows exactly how much he is making or losing per unit, he has permanent records, he is able to refer to previous corresponding periods for comparison, he is able to know weekly or monthly just the progress he is making. He has the merchandise cost, the expense of sales at hand, he knows without guesswork the results he may expect at the end of the year.

There are no pills to cure all ills to which our industry is heir, but there is one remedy at hand and it is labeled, standardization, given a uniform system of accounts generally adopted throughout the industry, given uniform monthly reports based on the uniform accounts, and given composite average reports, based upon these individual uniform reports, then you as individuals, will be able to locate and eliminate waste, when you have done so you can say to the consuming public, and to your critics, here are facts.

A second and closely related step which automatically follows the installation of uniform accounts is arranging for a clearing house for statistical information. Interchange of ideas is of paramount importance. Without inlet or outlet water stagnates. You may put your

This Book Tells How

HOW to cut down your percentage of solids fat and at the same time improve the quality of your cream — when and how to most successfully use cream, sweet butter, condensed milk or powdered milk—how to make brick ice cream without redipping—how to increase your overrun — most successful brine temperatures —best methods of using gelatine — proper sugar proportions in relation to quality and overrun—savings and improvements possible by correct use of ripeners.



These are just a few of the subjects covered in Mr. Thomas' "Profitable Ice Cream Making." Page after page is devoted to this kind of valuable, profitable, useful information. It is a book that you cannot afford to be without. Order yours now.

The price is only $1.00 postpaid

Packing Tubs That Will Last

Tubs of Washington Fir are recognized to be absolutely the best for ice cream packing use. Fir is used exclusively by the Government for tanks, flumes and all other purposes where water comes in contact with wood construction. It will not deteriorate under moisture. Experienced shippers are showing preference for these tubs that will give the longest service.

"ECONOMY" PACKING TUBS

are fast replacing the less durable makes. They are built from carefully selected, clear staves, with strongly constructed bottoms, and are strongly hooped. Stock tubs are green, but can be furnished in any color, stenciled and branded as desired.

"ECONOMY" ICE CREAM CABINETS

can be had in any style, Metal Lined, Tub, or Brick. All linings, cylinders and brick containers are made of galvanized Armco Ingot Iron. They are strongly built, well insulated, and highly finished, in mahogany.

own house in order and your records may furnish you with excellent information relative to your own business, but you are still without a standard yardstick for measuring your operations. Without the yardstick you can only measure the growth of your own shadow, which is unreliable because it changes as you change.

* * *

Mr. J. W. Clopton, secretary of the Southern Ice Cream Manufacturers' Association, then addressed the meeting on the outlook for business conditions for the coming season, expressing the opinion that with proper energy and economy in operating we might look forward to a fairly prosperous year. Mr. Clopton stressed the importance of looking carefully into the matter of credits to the end that no serious loss may be sustained from bad debts.

ADVANTAGES AND CORRECT USES OF POWDERED MILK.

By Mr. N. C. Hoag of the Merrell-Soule Sales Corporation, Little Falls, N. Y.

Quality is, or should be, the aspiration of every manufacturer in the making of his product.

This rule, also applies to ice cream manufacturers, and to secure any claims to this ambition, a thorough knowledge of the ingredients and their proportion one to another, is essential.

The composition of ice cream is made up of certain proportions of butterfat, milk solids—not fat, sugar, binder and moisture (water). Many ice cream manufacturers say "There is no water in my ice cream," or "I don't want any water in my product," yet—the fact remains, that milk, cream and dairy products contain large amounts of water.

Also, some ice cream contains egg, and the time was when corn starch was used extensively, as it gave smoothness and body to the finished product. And thus from the study of this fact, ice cream making has become a scientific proposition.

With the advent of pure food laws, and laws of sanitation, products of this nature have been eliminated and milk products used, so that today ice cream is technically a dairy or milk product.

Butterfat content may be increased, but butterfat alone can not produce quality, or can a lack of it give satisfactory results. It has a certain food value and its caloric content is a little better than twice of that milk solids not fat.

But there are elements in the milk solids not fat, especially the minerals, ash and salt, which are very necessary to building up the body, bone and tissue. It is for this reason that the purest of milk products should be used.

Powdered milk, when properly milk, has all the vital elements in their natural state. The casein remains soluable, the albumin is not coagulated, and the mild sugar is uncarnalized. Such solids added to the mix produce a superior quality of ice cream.

Another good reason for the use of powdered milk in ice cream is that the known amount of milk solids not, fat, will not vary as in the use of condensed or evaporated milks, as generally made. Condensed milk is salvy to the mouth when eaten alone, and imparts this characteristic to the ice cream when used. This trait may also be overcome by the use of powdered milk, this furnishing a clean eating "Give us another dish of ice cream, please," ice cream.

Having given formula with an established per cent of milk solids not fat desired, it is a simple problem in arithmetic to determine the amount of powder to be used, to build up the solids to the required point.

Analysis of milk, condenced milk and evaporated milk, and powdered milk:

Fluid milk contains in this locality 4 per cent of butterfat, and 8½ per cent of milk solids not fat. This means then that the balance (87½ per cent) is moisture (water).

Evaporated milk contains 25 per cent of milk solids (8 per cent fat, 17 per cent milk solids not fat) and 75 per cent of moisture.

Plain skimmed condensed contains 27 per cent of

Sweetened skim condensed contains 28 per cent of solids, 45 per cent of sugar and 27 per cent water.
milk solids not fat, and 73 per cent of water.

Powdered milk contains 98 per cent of milk solids not fat and only 2 per cent of moisture.

It is worthy of note here that where there is less than 3 per cent of moisture, there is no bacteria action, in fact, bacteria tend to die off rather than propagate. Thus, it is seen that powdered milk contains in the most consolidated, pure and sanitary form the greatest amount of milk solids not fat with which to build up the body of the mix. It can be made up into fluid skimmed milk or whole milk, three to one condensed milk, or evaporated milk—by properly mixing with water, and in the case of whole and evaporated milks, by the addition of the proper amount of butterfat.

Much has been said and written about "grainy" or "sandy" ice cream. Let us differentiate between "grainy" and "sandy" ice cream.

Grainy ice cream is produced by the crystallization of the milk sugar and second by the formation of oversized ice crystals. The first is largely due to the use of super-heated, condensed or evaporated or sweetened

NEW ICE CREAM CATALOG

We are now distributing our new up-to-the-minute, fully illustrated ice cream and milk plant catalog, carrying very latest prices. This is an interesting book. Write us to-day for a copy before the supply is exhausted.

DAIRYMEN'S MFG. & SUPPLY CO.
403 North Main St. ST. LOUIS, MO.

B. Riley Hauk
President

At present low prices for retinning Ice Cream Cans you can make a very decided savings over the purchase of new cans.

Take advantage of this service, have your rusty cans retinned instead of junking them and buying new cans.

Our price for retinning a five gallon Ice Cream Can is seventy-five cents and ten cents for Covers—about one third the cost of a new can.

Use your old crates in shipping us your rusty cans. Just mark your tags—

MANITOWOC PLATING WORKS
MANITOWOC, WIS.

We will do a most satisfactory job and get your cans back to you promptly.

The Mark of Merit

FOAM!

Are You Troubled With Foam In Your Ice Cream Mix?

There's no use pasteurizing mix when FOAM containing millions of spores, bacteria and mold are constantly recontaminating and preventing your accomplishing the desired result.

SUREST WAY TO PREVENT FOAM IS TO ELIMINATE ALL AIR AND GASES WHEN STARTING TO PASTEURIZE. THE VERTICAL COIL *always revolving from the bottom up forces all air and gases up and out of the liquid preventing FOAM.*

The coil is just as effective whether the vat is full or if there is just a little of the liquid in the bottom—IT CAN NEVER PULL ANY SURFACE AIR INTO THE CONTENTS.

VATS OF GLASS OR HEAVILY TINNED COPPER—Insulated with corkboard.

No wearing metal surfaces in liquid area.

ELIMINATION OF STUFFING BOXES DOES AWAY WITH THE PRINCIPAL SOURCES OF RECONTAMINATION.

Vertical construction requires less floor space. SAVES 50% IN DRIVING POWER.

condensed milk, containing a super-saturation of milk sugar. These crystals are formed in the "Pan" before the batch is struck, that is, drawn from the pan; and while pasteurization is supposed to eliminate them by giving a greater amount of moisture for their absorption, it has been proven that there seems to be a nucleus left so when the finished cream stands in the cooler for from four to six days there is a precipitation of these crystals and their size increases with the age of the ice cream and become more predominant and noticeable.

The large ice crystals are caused by a slow freezing both in the freezer and in the hardening room. A low brine at the freezer and a low even temperature in the hardening room, with a package that the cold can penetrate the easiest, will produce ice cream practically free from these crystals. Let it be understood that only about 40 to 60 per cent of the moisture in ice cream freezes and water is all that does freeze in ice cream.

Sandy ice cream, the kind that leaves a powdery, puckery, mealy taste in the mouth, may be better ascribed to hardened casein or coagulated albumen in the milk.

Super-heating milk tends to carnalize the sugar and coagulate the albumen. The housewife, in baking her cake, does not first cook the egg. She puts it in raw. WHY?—it acts as the binder for the gas bubbles that make her cake light. So albumin in ice cream assists as a binder and smoother.

In the beginning we stated that properly made, powdered milk contains all the vital elements in their natural, free state. Thus the albumin is allowed full action when powdered milk is used.

As to the super-saturation of milk sugar by the use of powdered milk: Unless the per cent of milk solids not fat is raised beyond the danger point this super-saturation is unlikely to occur. It may be well to determine how much milk solids not fat will unite with the fat content of ice cream to the best advantage. Take, for instance, 4 per cent milk and 20 per cent cream. After separating the cream from the milk, the milk contains 8 9-10 per cent of milk solids not fat, and the cream 7.13 per cent of milk solids not fat, or a total of 16 per cent. The total butter fat content is 24 per cent. The average of each, when combined, is 12 per cent fat and 8 per cent milk solids not fat; about 4 per cent is milk sugar. Ice cream should not contain more than 5 per cent of milk sugar if one desires to avoid its crystallization.

Since milk solids not fat are about 50 per cent milk sugar, it will be seen that we have a 1 per cent allowance of milk sugar, or a 2 per cent allowance of the milk solids not fat content, which may be added to the total solids of the ice cream.

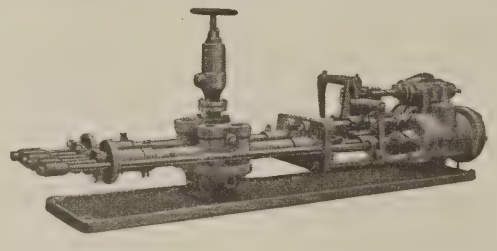
According to the above formulas we should have not less than 20 per cent of milk solids at all times in our mix. By deducting the per cent fat content from the total milk solid content (12 per cent) will give the per cent of milk solids not fat to be used, which per cent may be increased from one to two per cent, but never more.

The manner of dissolving powdered milk and its addition to the batch is simple.

Many ice cream manufacturers believe that they must have an emulsor, a viscolizer or a homogonizer. Let it be stated here that these machines are necessary only when it is desired to reconstitute butter. But putting the mix through one of these several machines breaks up the molecule to a finer degree and produces a smoother ice cream.

The "Cold Batch" method is the simplest and requires only the dissolving of a powder in a part of a fluid to be used, either water, milk or skimmed milk. It is best to allow this to stand 12 to 16 hours to gain a natural viscocity. There are acids in the milk which are not immediately absorbed by the fluid but are in a few hours. This may then be added direct to the mix.

The pasteurization method consists of dissolving the required amount of powder in part of the fluid—one part powder to three parts of fluid—and then heat up. Let it be a flash heat. If mixed in water, heat to 190 deg. F., skimmed milk 170 deg. F., and whole milk to 160 deg. F. Do not hold at these temperatures, but cool at once by the addition of the rest of the fluid. Many manufacturers are not equipped with boilers of sufficient steam pressure to run their mix, holding the heat continuously. Pasteurization temperature is best.



In flash heating, this should be accomplished in from 15 to 20 minutes. If it takes longer, do not go above the temperature reached at the limit of 20 minutes, unless that temperature is below 145 deg. F.

The choosing of a powder then becomes the paramount issue, and every manufacturer desiring quality should test the powder for sediment and albumin especially.
